Mock integrator, nothing sent to GİB

COMPLETE GUIDE · TÜRKIYE · EVERY SCREEN

Turkish Localization Suite for Odoo 19

VKN and TCKN, KDV with tevkifat, istisna and stopaj, e-Fatura and e-Arşiv chosen for you, e-İrsaliye on every delivery, and the month end in Tekdüzen: Mizan, Bilanço, Gelir Tablosu, Ba/Bs and e-Defter. Shown step by step on a live demo.

BASE · TAX · REPORTS · E-DOC CORE · E-FATURA · E-İRSALIYE · SUITE

START

About this guide

A Turkish company does not send an invoice the way a company in most countries does. The invoice is an XML file that goes through the revenue administration, the tax on it may be split between seller and buyer, and the accountant closes the month on a trial balance laid out in a national chart of accounts. This guide shows how the Way4Tech Turkish Localization Suite handles all of that in Odoo 19, one screen at a time. You do not need to have used Odoo before.

Who it is for

The accountant and the mali müşavir (the certified public accountant who signs off a Turkish company's books), the person who issues invoices and delivery notes, the warehouse that ships goods, and anyone being shown the suite for the first time.

How to read it

Part 1 explains the Turkish rules in plain words. Parts 2 to 4 set the suite up. After that each part follows one job from start to finish, with a numbered screenshot for every step.

The live demo

Galata Örnek Ticaret A.Ş., an invented office furniture and IT equipment trader in Şişli, İstanbul, with three months of sales, purchases, rent and fees, e-invoices in every state and the month-end reports.

HOW IT WORKS

The demo company

Address	**tr-demo.way4tech.com**
Sign in	**w4demo** / **Demo2026**
Company	Galata Örnek Ticaret A.Ş. · İstanbul · Turkish lira (TRY) · Tekdüzen chart of accounts
Runs on	Odoo 19 Community, with Invoicing and Inventory
GİB connection	**None.** The demo uses the suite's built-in mock integrator. Nothing on it ever reaches GİB or any real service.

Every company, person, VKN and TCKN on the demo is invented. Identity numbers pass the checksum but belong to nobody. The tax rules on the demo (tevkifat ratios, stopaj rates, exemption codes) are illustrative and are marked unverified on purpose. The demo is shared, so anything you change may be seen by the next person or reset.

Module badges

The suite is seven modules. You can buy the whole suite or start with one part. Each part of this guide carries a badge saying which module it needs. A module always installs the modules it builds on, so e-İrsaliye brings e-Fatura, which brings the e-Document Core, and so on.

BADGE	MODULE	TECHNICAL NAME	PRICE	BUILDS ON
BASE	Turkish Localization Base	wt_tr_localization	USD 199	Odoo Invoicing and the l10n_tr chart
TAX	Turkish Tax Engine	wt_tr_tax	USD 299	Base
REPORTS	Turkish Accounting Reports	wt_tr_account	USD 349	Base, Tax
E-DOC CORE	Turkish e-Document Core	wt_tr_edocument	USD 499	Base, Tax, Odoo UBL

E-FATURA	Turkish e-Fatura & e-Arşiv	wt_tr_efatura	USD 599	e-Doc Core
E-İRSALIYE	Turkish e-İrsaliye	wt_tr_eirsaliye	USD 249	e-Fatura, Inventory
SUITE	Turkish Localization Suite	wt_tr_suite	USD 1,990	All six, plus the dashboard and the demo loader

What is in the guide

PART 1	Turkish tax and e-documents in ten minutes	PART 2	The suite, the menus and who can do what
PART 3	Signing in and the accountant's dashboard	PART 4	Setting up from zero
PART 5	Master data and partners	PART 6	The tax engine: tevkifat, stopaj, exemptions and ÖTV
PART 7	Invoices and bills with Turkish tax	PART 8	The e-document engine and the integrator
PART 9	e-Fatura and e-Arşiv: from invoice to accepted	PART 10	Errors, rejections and cancellation
PART 11	Incoming invoices: inbox, matching and answers	PART 12	Numbering, the GİB user list and the e-Arşiv daily report
PART 13	e-İrsaliye: the electronic delivery note	PART 14	Mizan, the Turkish trial balance
PART 15	Bilanço and Gelir Tablosu	PART 16	Form Ba/Bs and the declaration datasets
PART 17	e-Defter, the cost method and partner sub-accounts	PART 18	Control: audit trail, support package and the demo loader
PART 19	A fifteen minute walk-through	PART 20	The menu map

PART 1 Turkish tax and e-documents in ten minutes

This part is the Turkish background the screens assume. It explains the words, not the law. Rates, ratios and codes change by communiqué, so anything here that you would rely on in production is something to confirm with your mali müşavir.

IN THIS PART YOU WILL LEARN

- VKN and TCKN, and why the suite keeps them apart
- KDV and the three things that change it: tevkifat, istisna and ÖTV
- Stopaj, the withholding a buyer makes on rent and fees
- e-Fatura, e-Arşiv and e-İrsaliye, and who decides which one applies
- The month-end set: Mizan, Bilanço, Gelir Tablosu, Ba/Bs and e-Defter

Who is who: VKN and TCKN

Every Turkish taxpayer has an identity number. A company has a **VKN** (*Vergi Kimlik Numarası*), ten digits. A natural person, including a sole trader, has a **TCKN** (*T.C. Kimlik Numarası*), eleven digits. Both have a published check digit. Standard Odoo accepts either one in the single Tax ID field, which catches typing mistakes but cannot tell a company from a person. Turkish e-invoicing needs that answer, so the suite stores the two in separate fields and checks each with its own algorithm. A partner also has a *vergi dairesi* (tax office), an *il* (province) and an *ilçe* (district).

KDV, and what changes it

KDV (*Katma Değer Vergisi*) is Turkish VAT. The standard rate is 20%, with reduced rates of 10% and 1% for listed goods. Odoo's Turkish chart (l10n_tr) already ships those taxes. Four things make a Turkish invoice more than amount times rate:

TERM	WHAT IT MEANS	WHERE IN THE SUITE
Tevkifat *KDV tevkifatı*	Withholding VAT. For listed services the buyer keeps part of the KDV and pays it to the tax office himself. On a 2/10 service the buyer withholds 2 tenths of the KDV and the seller collects the other 8 tenths.	TAX Tevkifat Rules
Istisna *KDV istisnası*	An exemption. The line carries no KDV, and the invoice must say why with an exemption code. Exports are the common case.	TAX KDV Exemption Codes
ÖTV *Özel Tüketim Vergisi*	Special consumption tax on fuel, vehicles, tobacco, alcohol and some other goods, on four annexed lists.	TAX ÖTV Rules
Stopaj *gelir vergisi stopajı*	Income tax withheld at source. When a company pays rent to a person or a fee to a self-employed professional, it withholds a percentage and pays it over on the Muhtasar return.	TAX Stopaj Rules

The e-documents

Turkish invoices are electronic and pass through **GİB** (*Gelir İdaresi Başkanlığı*), the Revenue Administration. A company connects either through GİB's own portal or through an *özel entegratör*, a licensed private integrator. The file format is **UBL-TR**, the Turkish profile of UBL 2.1. Each document gets a unique **ETTN** (*Evrensel Tekil Tanımlama Numarası*), a UUID, and a sixteen-character number: a three-letter prefix, the year and nine digits.

DOCUMENT	WHEN	NOTES
e-Fatura	Both seller and buyer are registered e-Fatura users.	Delivered to the buyer's GİB mailbox. A commercial (TICARIFATURA) invoice can be accepted or rejected by the

		buyer.
e-Arşiv Fatura	The buyer is not registered: a person, a small business, many foreign buyers.	Issued by the seller and reported to GİB, rather than exchanged. The seller sends a daily report of what it issued.
e-İrsaliye	Goods leave the warehouse.	The electronic delivery note: what left, when, in which vehicle and with which driver. Registration for it is separate from e-Fatura.
e-Defter	Every month.	The electronic journal (yevmiye) and general ledger (kebir), signed with the company's mali mühür (financial seal) and filed with a berat.

Every e-invoice also carries a **scenario** (TEMELFATURA basic, TICARIFATURA commercial, IHRACAT export, YOLCUBERABER passenger, EARSIVFATURA e-Arşiv) and an **invoice type** (SATIS sale, IADE return, TEVKIFAT withholding, ISTISNA exempt, OZELMATRAH special base, IHRACKAYITLI registered for export). In the suite both are worked out from the invoice.

Month end

REPORT	WHAT IT IS
Mizan *geçici mizan*	The trial balance, read at a chosen depth of the Tekdüzen chart (usually three digits: 100 Kasa, 120 Alıcılar, 320 Satıcılar, 600 Yurt İçi Satışlar).
Bilanço	The balance sheet in the Tekdüzen layout: Aktif (assets) against Pasif (liabilities and equity).
Gelir Tablosu	The income statement, from gross sales down to net profit for the period.
Form Ba / Bs	Monthly notices of purchases (Ba) and sales (Bs) with any one counterparty at or above a threshold.
KDV-1, KDV-2, Muhtasar, Geçici Vergi	The VAT return, the return for VAT withheld as a buyer, the withholding return for stopaj, and the provisional income tax return.
7/A and 7/B	The two ways a company may keep its 7xx cost accounts: by function (7/A) or by nature (7/B). A company chooses one and keeps it.

What the suite is not. It is not certified by GİB, endorsed by it or affiliated with it. It does not file returns: the declaration screens produce the figures, and filing stays in GİB's own systems. And in this version it ships one integrator adapter only, the mock. Part 8 explains what that means for going live.

PART 2 The suite, the menus and who can do what

NEEDS: BASE

Everything lives under one app, Türkiye, plus extra fields on screens you already know: the contact, the product, the tax, the invoice and the delivery. This part is the map.

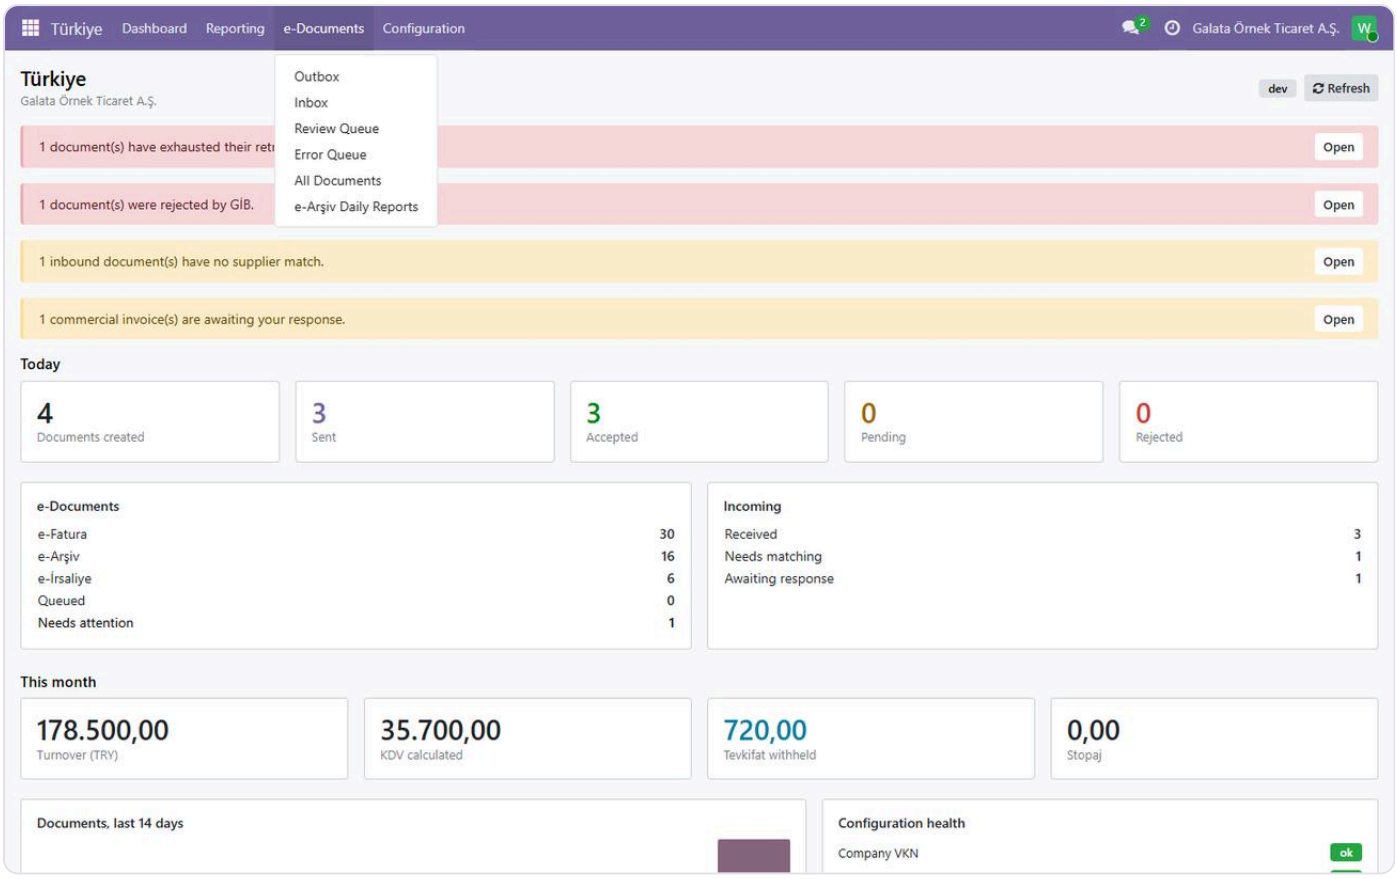

IN THIS PART YOU WILL LEARN

- What each of the seven modules adds
- The four menus of the Türkiye app
- The six Turkish roles, from user to system administrator
- Development, Staging and Production, and what Production refuses

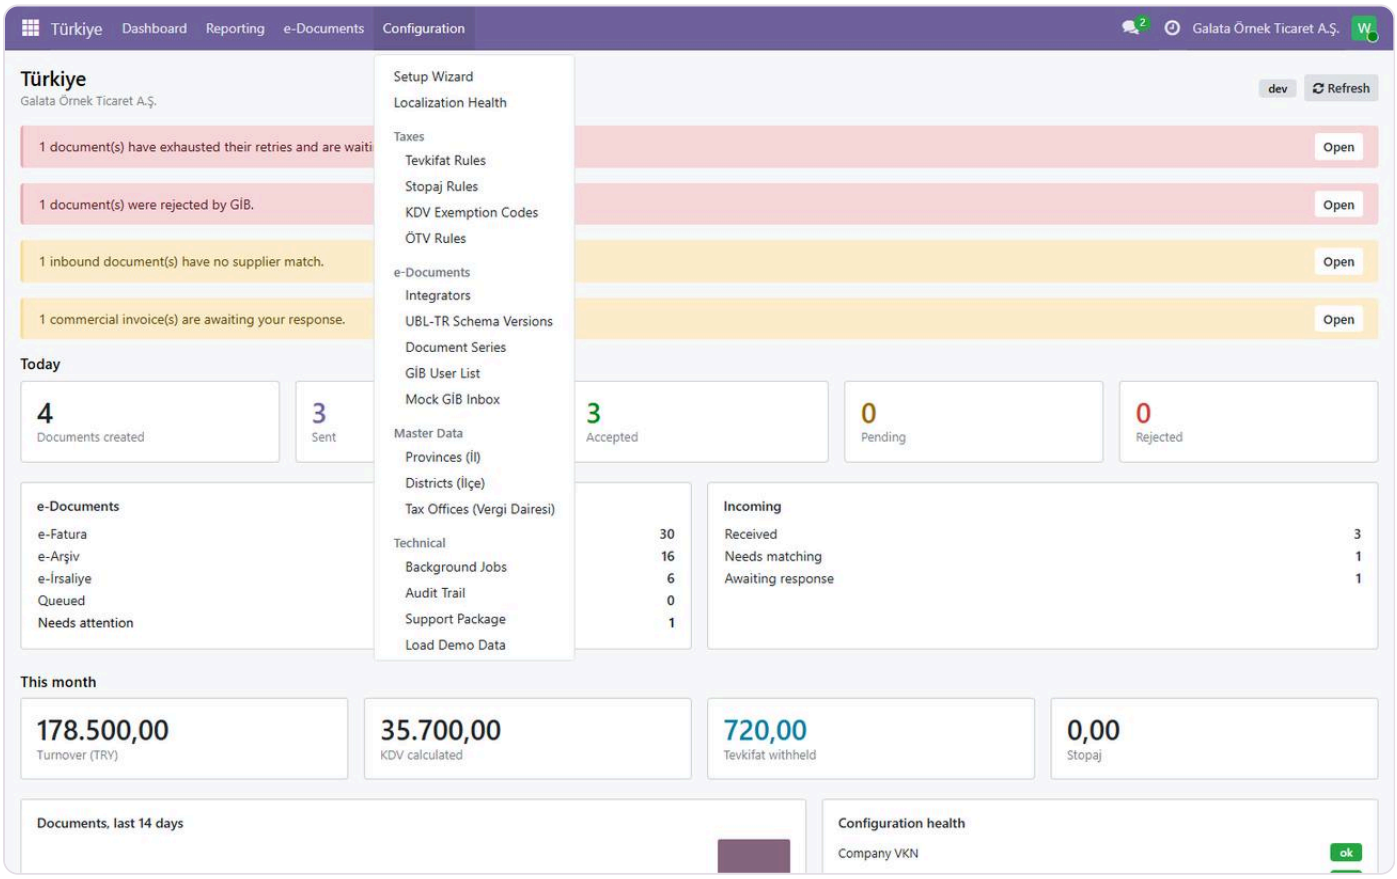

What each module adds

MODULE	ADDS
BASE	Separate VKN and TCKN fields with checksum validation, taxpayer type, MERSİS and trade registry numbers, 81 provinces and 973 districts, a starter list of tax offices, the setup wizard, the health check, the audit trail, the support package and the role ladder.
TAX	Tevkifat, stopaj, KDV exemption and ÖTV rules, each with effective dates and a Verified flag; Turkish fields on taxes and products; the KDV, tevkifat and stopaj breakdown on every invoice line and invoice; consistency warnings.
REPORTS	Mizan, Bilanço and Gelir Tablosu, Form Ba and Bs, the KDV-1, KDV-2, Muhtasar and Geçici Vergi datasets, the e-Defter book packages, the 7/A or 7/B choice and partner sub-accounts.
E-DOC CORE	The e-document record and its lifecycle, the integrator layer with a complete mock integrator, the UBL-TR builder and validator, the outbox and error queue, classified retries, the request log, background jobs and the live console.
E-FATURA	Automatic choice between e-Fatura and e-Arşiv with a written reason, scenario and invoice type, the sixteen-character numbering series, the GİB user list, the inbox and review queue for incoming invoices, the e-Arşiv daily report and the cancellation wizard.
E-İRSALIYE	The e-İrsaliye on outgoing deliveries: vehicle plate, trailer, driver and TCKN, carrier, actual despatch time, and a UBL-TR despatch advice.
SUITE	Installs all six, and adds the accountant dashboard and the demo data loader.

The Türkiye app

The Türkiye app. Top menus: **Dashboard**, **Reporting**, **e-Documents** (open here) and **Configuration**.

Configuration: the setup wizard and the health check, the tax rules, the e-document settings, the master data and the technical screens.

Roles

The suite adds one ladder of roles under Accounting. Each role includes the ones above it in this table. The administrator who installs the suite is given the top role automatically, so the menus are there straight away.

ROLE	CAN
Turkish Localization User	See the Turkish fields and read the Turkish master data. Opens the Dashboard.
Turkish Accountant	Run Mizan, the statements and the declaration datasets; maintain tevkifat and stopaj rules. Includes Odoo invoicing rights.
e-Document User	Create and send e-Fatura, e-Arşiv and e-İrsaliye, and work the inbox. Cannot cancel a sent document.
e-Document Manager	Cancel documents, force a retry and override the automatic e-Fatura or e-Arşiv choice. Sees the integrator settings.
GİB Integration Manager	The only role that can read the integrator credentials and the mali mühür certificate, and run connection tests.
Turkish System Administrator	Numbering series, UBL-TR schema versions, the mock inbox, the environment, the audit trail, the support package and the demo loader.

Environment: Development, Staging, Production

Each company has a Turkish e-document environment. In **Development** and **Staging** the mock integrator and the demo loader are allowed. In **Production** both are refused, and so is transmitting any document that uses a rule nobody has marked Verified (a tevkifat rule, an exemption code, a stopaj rule or the UBL-TR schema version). Moving a company to Production is a deliberate act on the company form, and it is recorded.

PART 3 Signing in and the accountant’s dashboard

NEEDS: SUITE

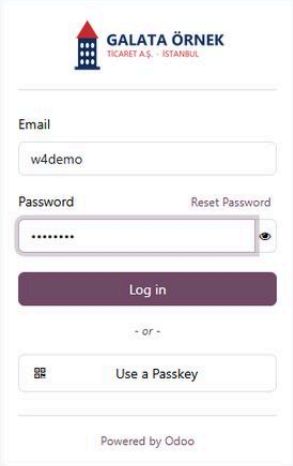

The dashboard answers the questions a Turkish accountant starts the day with: did everything go out, did anything come back rejected, is there anything to act on, what is this month's KDV, and is the configuration still healthy.

TRY IT YOURSELF ON THE DEMO

1. Open tr-demo.way4tech.com and sign in as w4demo / Demo2026
2. Open Türkiye, Dashboard
3. Press Open on the red rejection alert
4. Come back and read Configuration health at the bottom

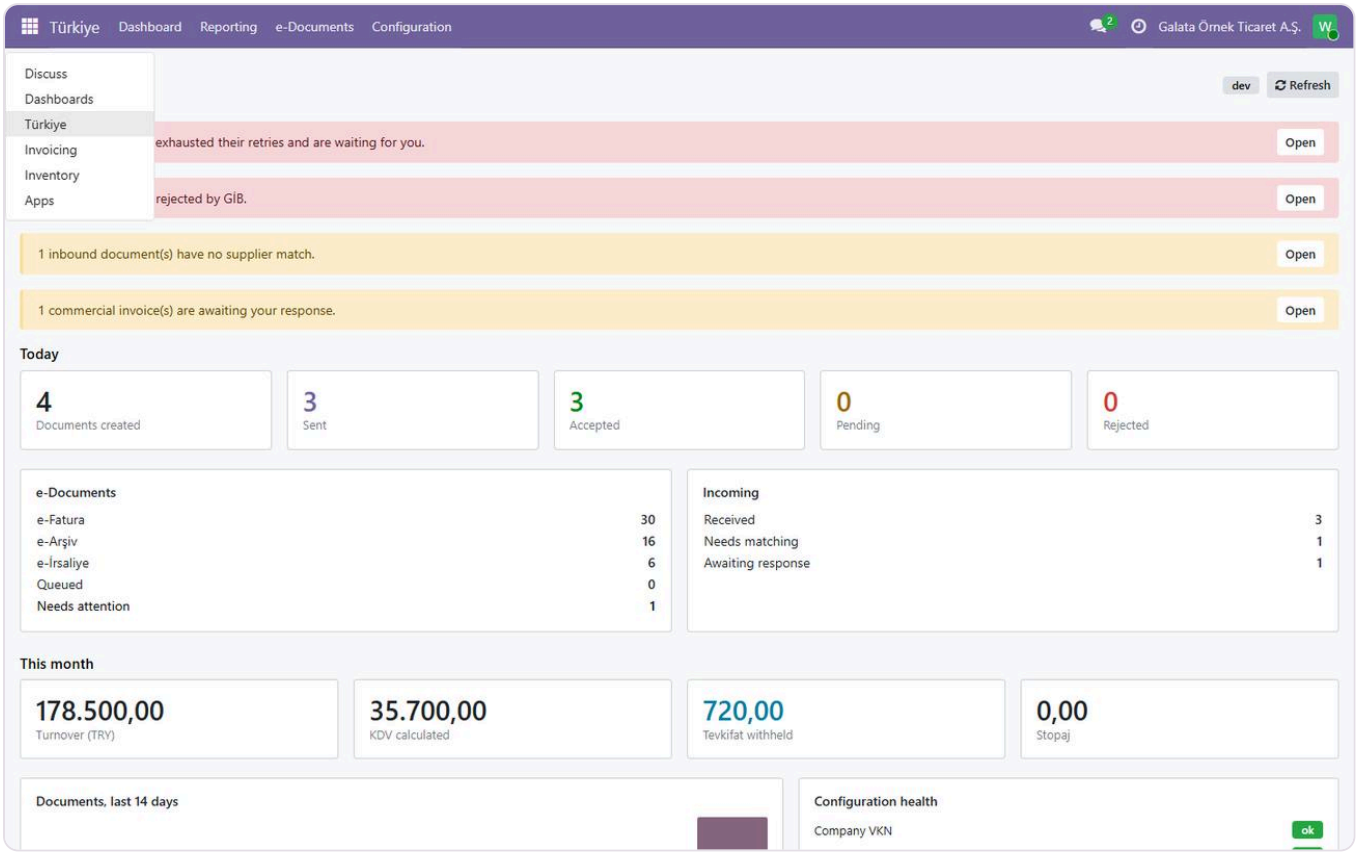

1 Sign in

Open **tr-demo.way4tech.com**, type the login **w4demo** and the password **Demo2026**, and press Log in.

2 Open the Türkiye app

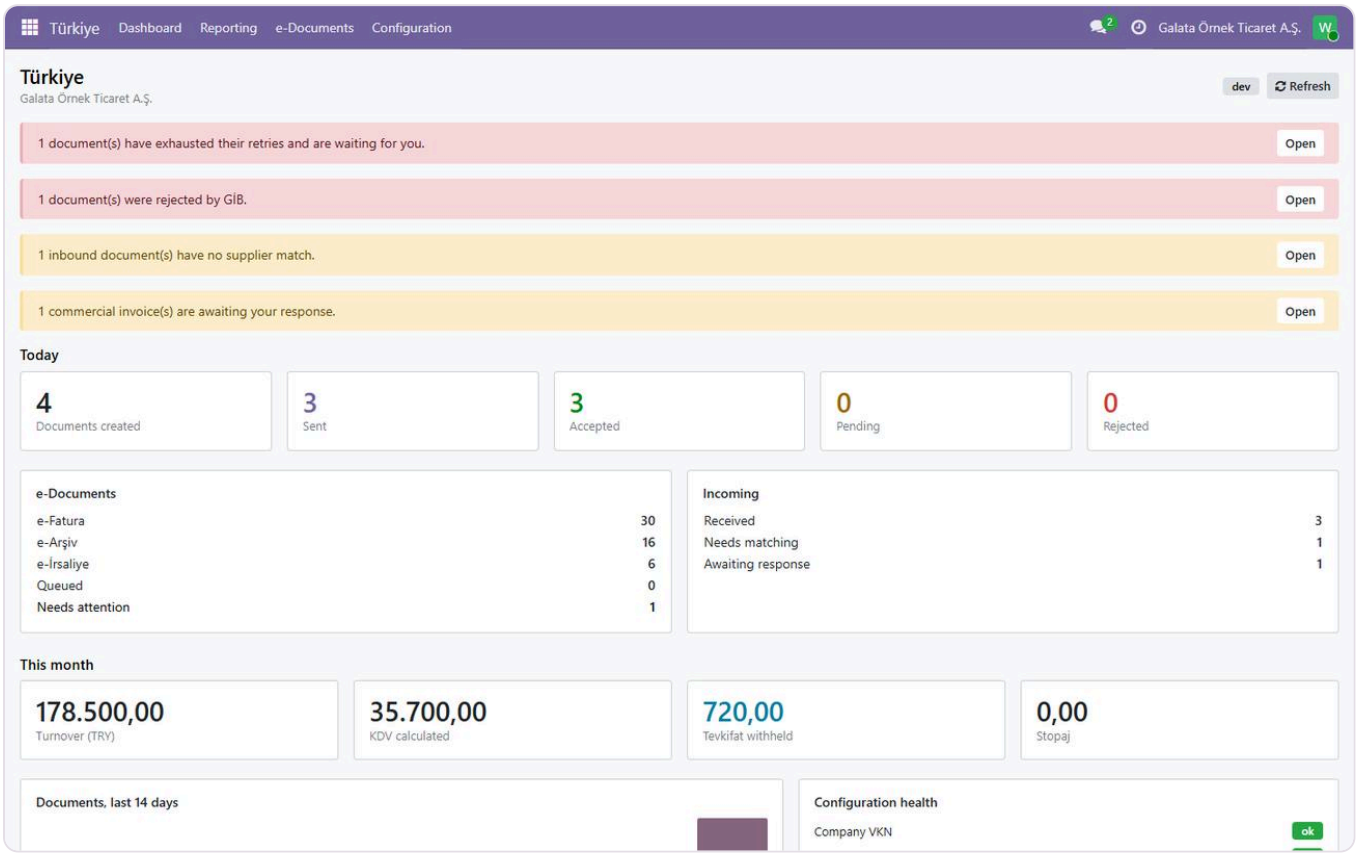

The app menu, top left, lists the apps. **Türkiye** is the suite; Invoicing and Inventory are standard Odoo with Turkish fields added.

3 Read the alerts first

The red and amber bars at the top are the only things that need a person today: documents that used up their retries, documents GİB rejected, incoming invoices with no supplier match, and commercial invoices waiting for your answer. Each has an **Open** button that goes to the list behind it. On a healthy day the area is empty.

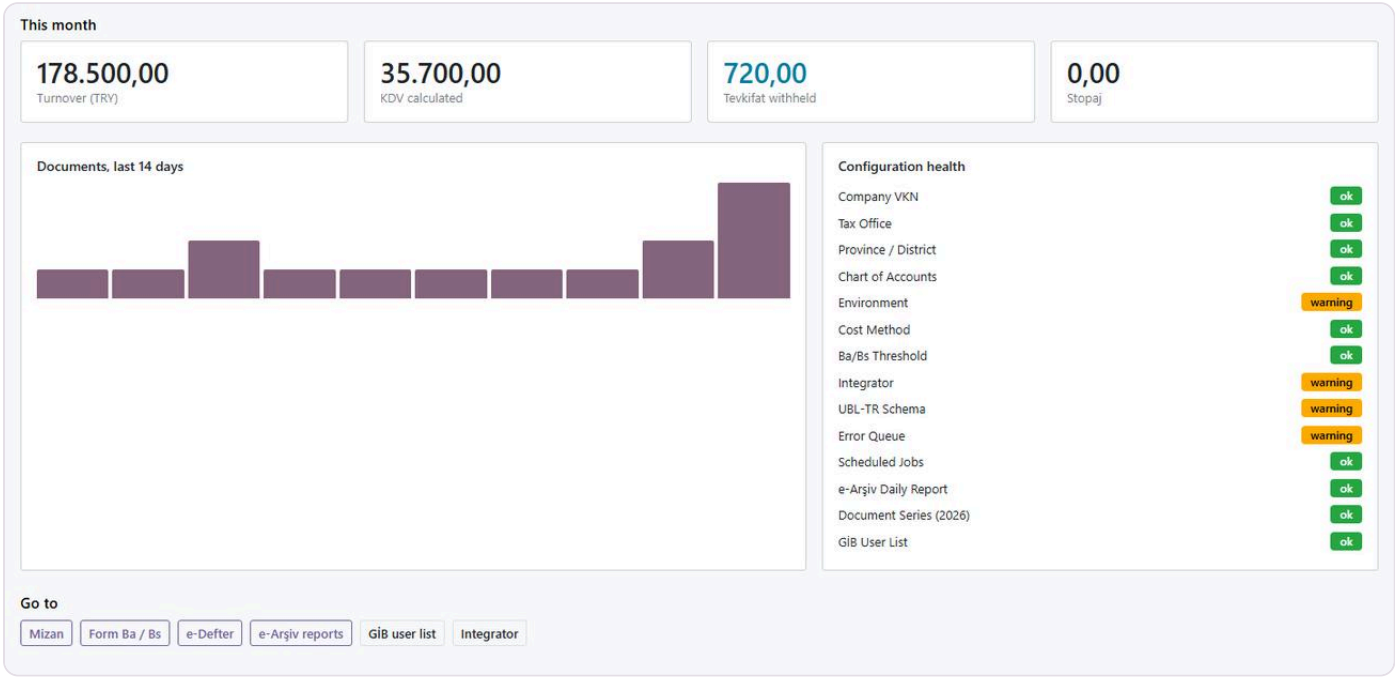

The dashboard is loaded in one call to the server, and it only raises an alert for something somebody has to act on.

4 The figures

Today: documents created, sent, accepted, pending and rejected today. **e-Documents**: totals by type, the queue and what needs attention. **Incoming**: received, needing a supplier match and waiting for a response. **This month**: turnover, KDV calculated, tevkifat withheld and stopaj, read from this month's posted customer invoices. **Documents, last 14 days** is the daily count. **Configuration health** repeats the health check (Part 4) with a status on every line. The environment badge (dev) and **Refresh** sit top right.

The stopaj figure reads customer invoices. Stopaj in this suite is normally on vendor bills (rent and fees you pay), so on most companies that tile shows zero; use the Muhtasar dataset in Part 16 instead.

PART 4 Setting up from zero

NEEDS: BASE

A new company needs its identity, its tax office and address, a cost method, e-documents switched on and an integrator. The setup wizard walks through all of it; the health check then says what is still missing.

IN THIS PART YOU WILL LEARN

- The ten steps of the setup wizard
- Every Turkish setting on the company form
- Reading the health check and fixing what it flags
- What installing the suite does not do to your chart of accounts

TRY IT YOURSELF ON THE DEMO

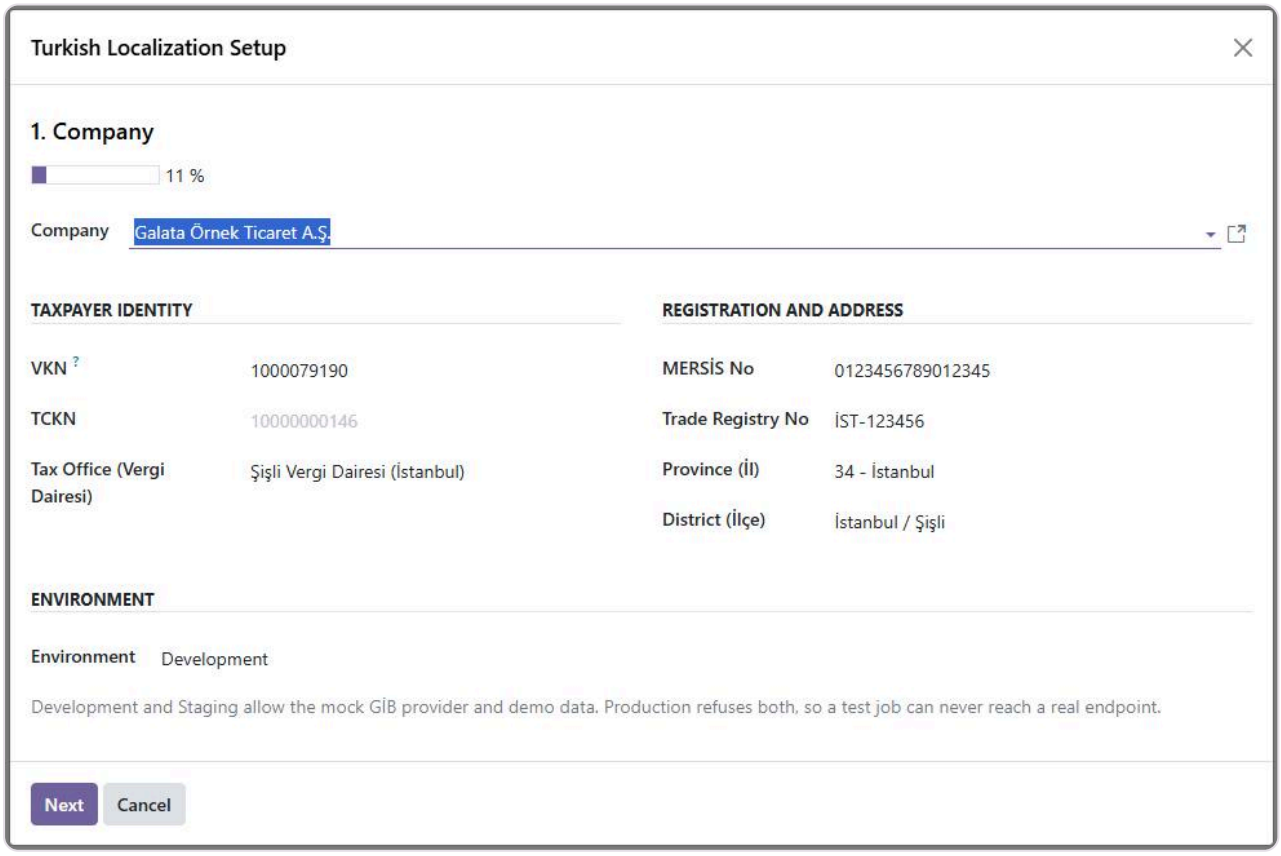

1. Configuration, Localization Health: 10 healthy, 4 warnings
2. Read why the integrator and the UBL-TR schema are warnings
3. Configuration, Setup Wizard: read step 1, then Cancel

Chart of accounts. Installing the suite does not install or replace a chart. Load the Türkiye chart (l10n_tr) on the company before you start, from Invoicing settings. Without it the Turkish taxes do not exist and every invoice fails validation for a missing tax. (The demo loader in Part 18 loads it for you on an empty company.)

1 Step 1: Company

Configuration, Setup Wizard (Turkish System Administrator). Enter the **VKN**, or the **TCKN** for a sole trader, never both. Then the tax office, MERSİS number, trade registry number, province and district, and the environment. The wizard reads what the company already has, so it is safe to run again.

Each step is saved as you leave it with Next, so stopping half way keeps what you have done. Every save is written to the audit trail.

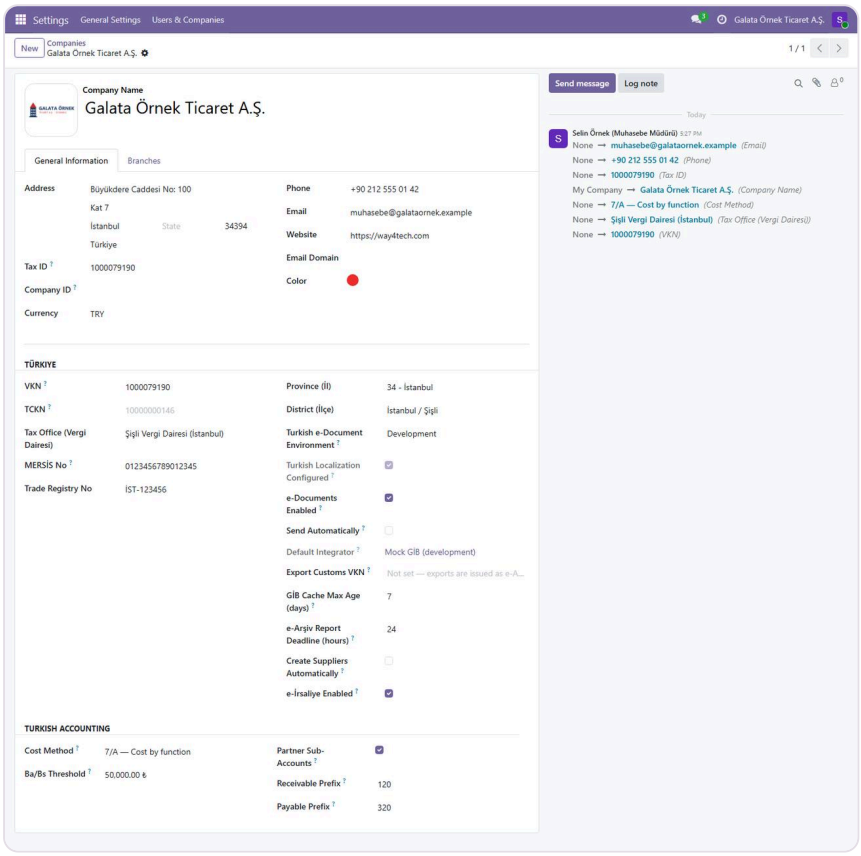

2 Steps 2 to 10

2 Tax Setup and **3 Cost Method** come from the Reports module REPORTS: choose 7/A or 7/B (there is no default, on purpose) and whether to use partner sub-accounts. **4 e-Documents**, **5 Integrator**, **7 Document Series**, **8 GİB User Synchronisation** and **9 Test Connection** come from e-Fatura E-FATURA. **6 Mali Mühür / e-Signature** is a step of its own. Steps from modules you have not installed are skipped. **Finish** opens the health check.

3 The company form

Every answer lands on the company (Settings, Companies, the Türkiye section of General Information). The Turkish block holds the VKN or TCKN, tax office, MERSİS, trade registry, province, district, environment and a Localization Ready flag. The e-document block holds e-Documents Enabled, Send Automatically, the default integrator and the e-İrsaliye switch. Turkish Accounting holds the cost method, the Ba/Bs threshold and the sub-account settings.

Every Turkish company setting

SETTING	MODULE	WHAT IT DOES
VKN / TCKN	BASE	The company's own identity. One or the other.
Tax Office, MERSİS, Trade Registry	BASE	Printed into the UBL-TR as the supplier party.
Province / District	BASE	From the national lists; the district must belong to the province.
Turkish e-Document Environment	BASE	Development (default), Staging or Production. Production refuses the mock integrator, the demo loader and unverified rules.
e-Documents Enabled	E-DOC CORE	Turns on e-documents for the company. Off, customer invoices get no Turkish document.
Send Automatically	E-DOC CORE	Default on. Queue the e-document as soon as the invoice is posted. Off, documents wait in the outbox for someone to press Send. (The demo has it off.)
Export Customs VKN	E-FATURA	The VKN an export e-Fatura is addressed to. Not shipped, because it is a legal parameter. Empty, foreign customers are routed to e-Arşiv.

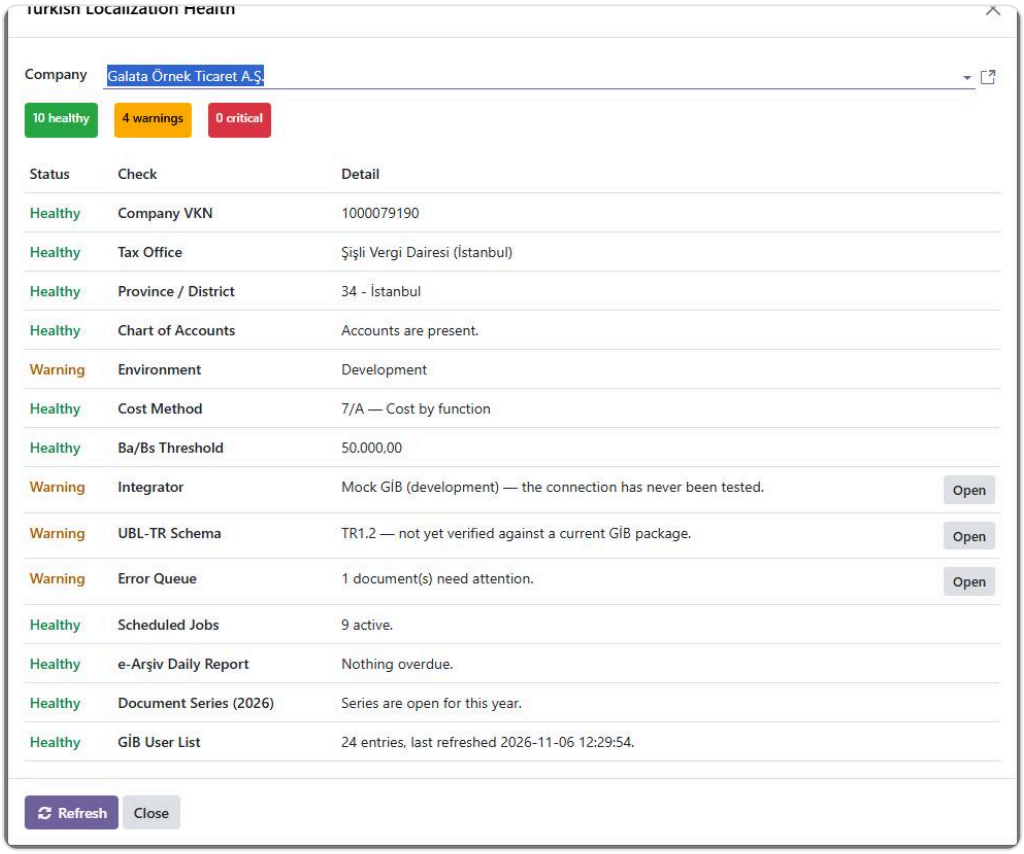

GİB Cache Max Age (days)	E-FATURA	Default 7. How old the GİB user list may get before the health check warns.
e-Arşiv report deadline (hours)	E-FATURA	Default 24. When a daily report counts as overdue.
Create unknown suppliers	E-FATURA	Default off. Lets an incoming invoice from an unknown VKN create a supplier. The suite recommends leaving it off.
e-İrsaliye Enabled	E-İRSALIYE	Default off. Issue an e-İrsaliye when an outgoing delivery is validated.
Cost Method	REPORTS	7/A by function or 7/B by nature. No default. Locked once the company has posted entries.
Ba/Bs Threshold	REPORTS	The amount at which a counterparty is reportable. A legal parameter; the demo uses 50,000 as a placeholder.
Partner Sub-Accounts, Receivable / Payable Prefix	REPORTS	Code customers and suppliers under 120.xx and 320.xx (Part 17).

The health check

4 **Configuration, Localization Health**

One line per check, each Healthy, Warning or Critical, with counts at the top and an **Open** button where there is a screen to fix it. Press **Refresh** after a change. The checks: company VKN, tax office, province and district, chart of accounts, environment, cost method, Ba/Bs threshold, integrator (and whether its connection was ever tested), UBL-TR schema verification, error queue, scheduled jobs, e-Arşiv daily report, document series for this year and the age of the GİB user list.

On the demo the four warnings are honest: Development is not Production, the mock integrator was never connection-tested, the UBL-TR schema version is not verified, and one document is waiting in the error queue.

PART 5 Master data and partners

NEEDS: BASE

Most rejected Turkish invoices trace back to a partner: a VKN in the wrong box, a missing tax office, a customer nobody checked against the GİB register. This part sets partners up properly.

IN THIS PART YOU WILL LEARN

- Provinces, districts and tax offices
- The Türkiye tab on a contact, for a company and for a person
- Validate VKN/TCKN and Check GİB Registration
- Fixing imported numbers in bulk

TRY IT YOURSELF ON THE DEMO

1. Contacts: open ABC Teknoloji A.Ş., Türkiye tab
2. Open Ahmet Yılmaz: a TCKN, taxpayer type Natural Person
3. Open Ege Tekstil Sanayi A.Ş.: not registered for e-Fatura

Master data

1 Provinces (İl)

Configuration, Master Data, Provinces: all 81, with the plate code, region and number of districts.

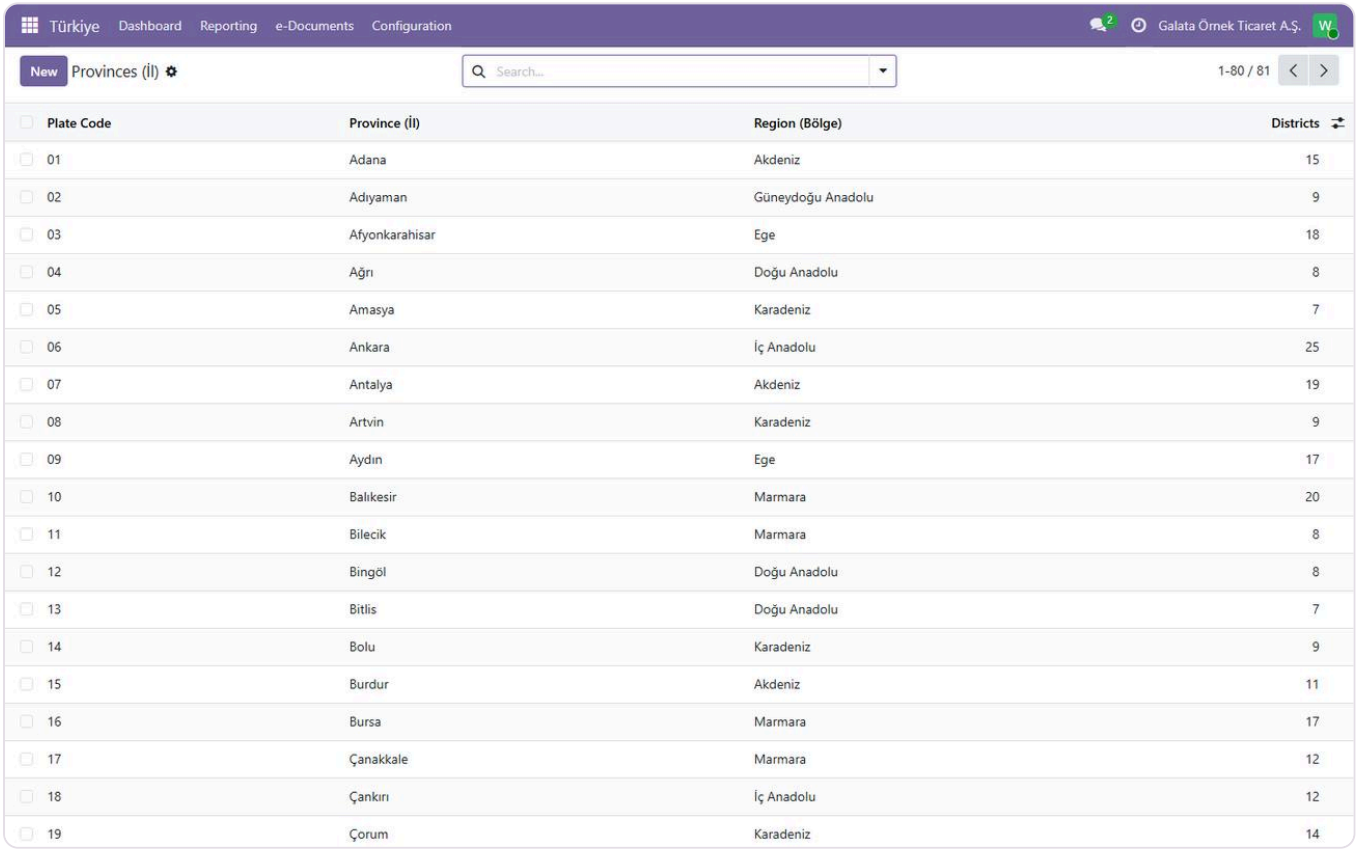

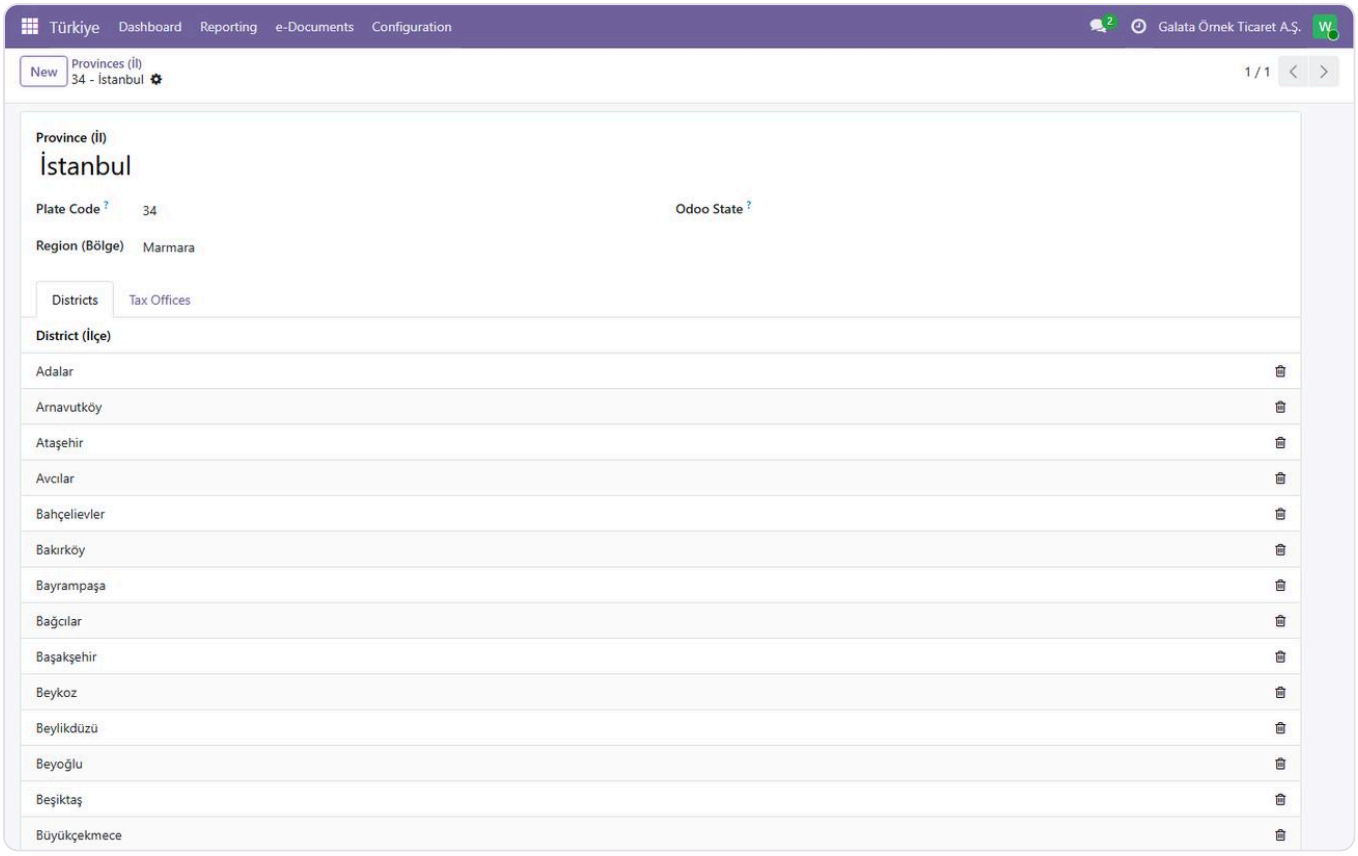

Plate Code	Province (İl)	Region (Bölge)	Districts
01	Adana	Akdeniz	15
02	Adıyaman	Güneydoğu Anadolu	9
03	Afyonkarahisar	Ege	18
04	Ağrı	Doğu Anadolu	8
05	Amasya	Karadeniz	7
06	Ankara	İç Anadolu	25
07	Antalya	Akdeniz	19
08	Artvin	Karadeniz	9
09	Aydın	Ege	17
10	Balıkesir	Marmara	20
11	Bilecik	Marmara	8
12	Bingöl	Doğu Anadolu	8
13	Bitlis	Doğu Anadolu	7
14	Bolu	Karadeniz	9
15	Burdur	Akdeniz	11
16	Bursa	Marmara	17
17	Çanakkale	Marmara	12
18	Çankırı	İç Anadolu	12
19	Çorum	Karadeniz	14

2 A province

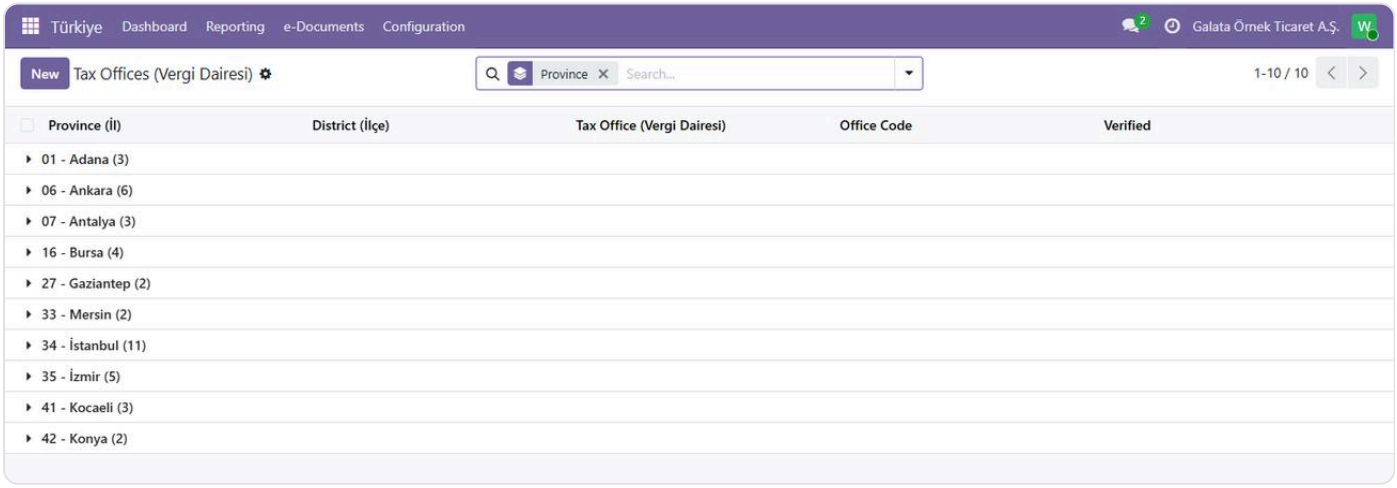

The form lists its districts on the **Districts** tab and its tax offices on **Tax Offices**. The 973 districts are also listed on their own under **Districts (İlçe)**.

3 Tax offices (Vergi Dairesi)

Name, code, province and a **Verified** flag. The suite ships 41 tax offices in the largest provinces as a starting list, all unverified. Add the ones your partners use and tick Verified once checked.

The province, district and tax office lists are national data and are shared by every company in the database.

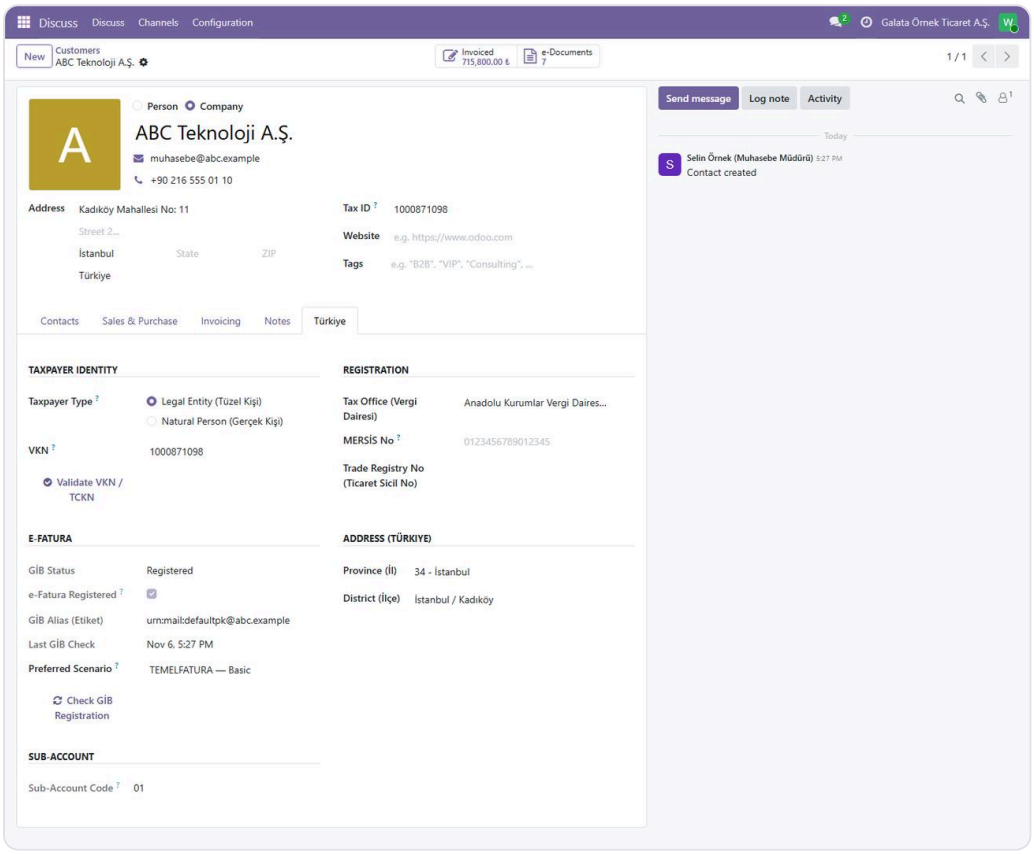

The Türkiye tab on a contact

4 A company

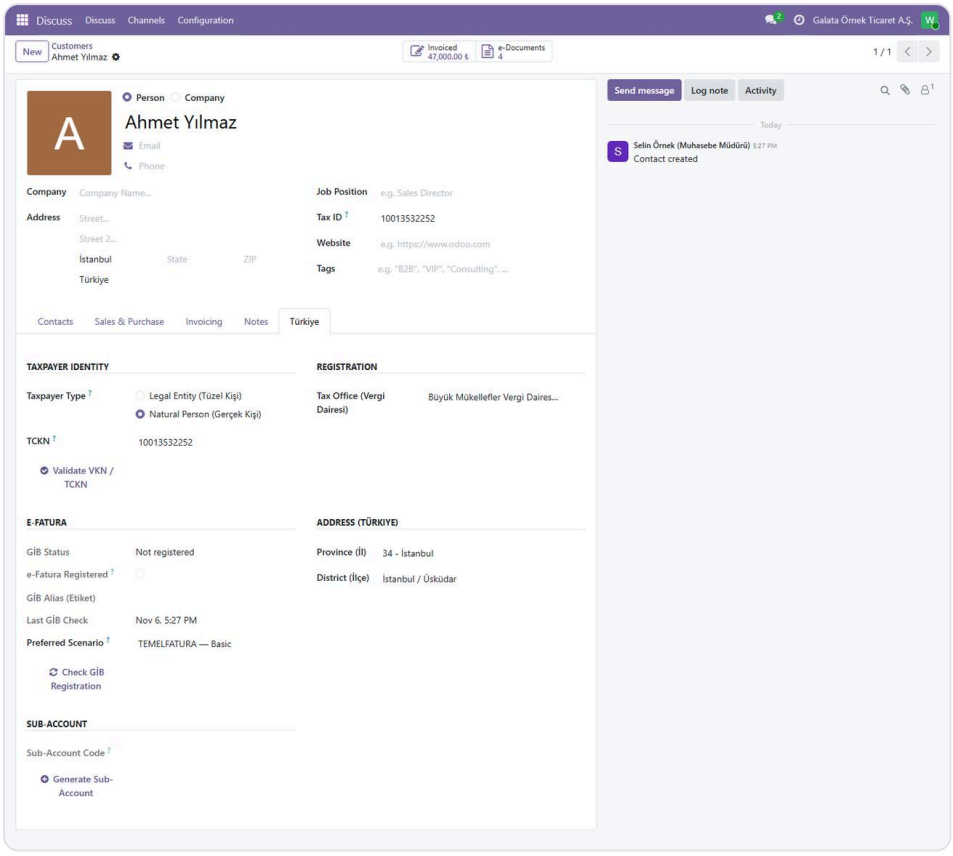

Taxpayer Type is worked out from which number is filled in and can be set by hand before the number is known. Then **VKN** (10 digits), **TCKN** (11 digits), tax office, MERSİS, trade registry, province and district. The **Tax Identity** field shows whichever number is set; that is the value routing and the GİB list use. **Validate VKN/TCKN** re-runs the checksum offline. The e-Fatura group **E-FATURA** shows GİB status, whether the partner is a registered e-Fatura user, its GİB alias and when it was last checked, and the **e-Fatura Scenario** to use for this customer. **Check GİB Registration** asks the integrator now.

A checksum only says a number is well formed. Whether the company is registered is a separate question, answered by the GİB user list.

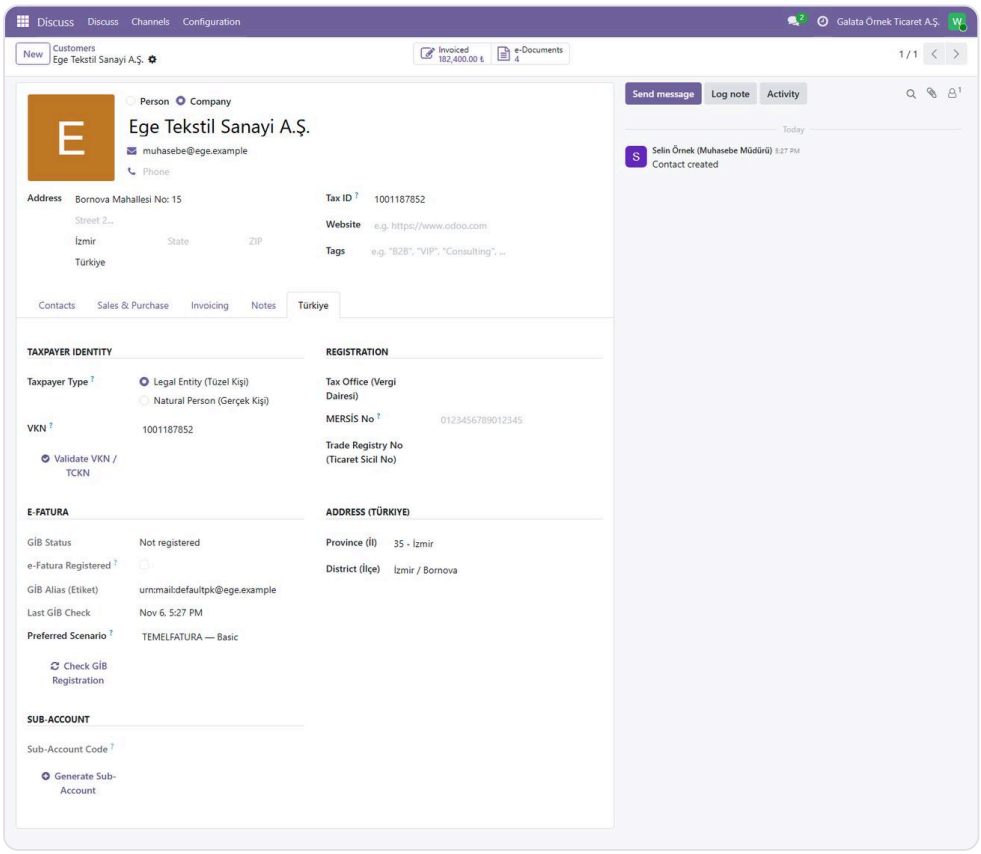

5 A natural person

Ahmet Yılmaz has a TCKN and is a Natural Person. He is not on the GİB e-Fatura list, so anything sold to him goes out as e-Arşiv.

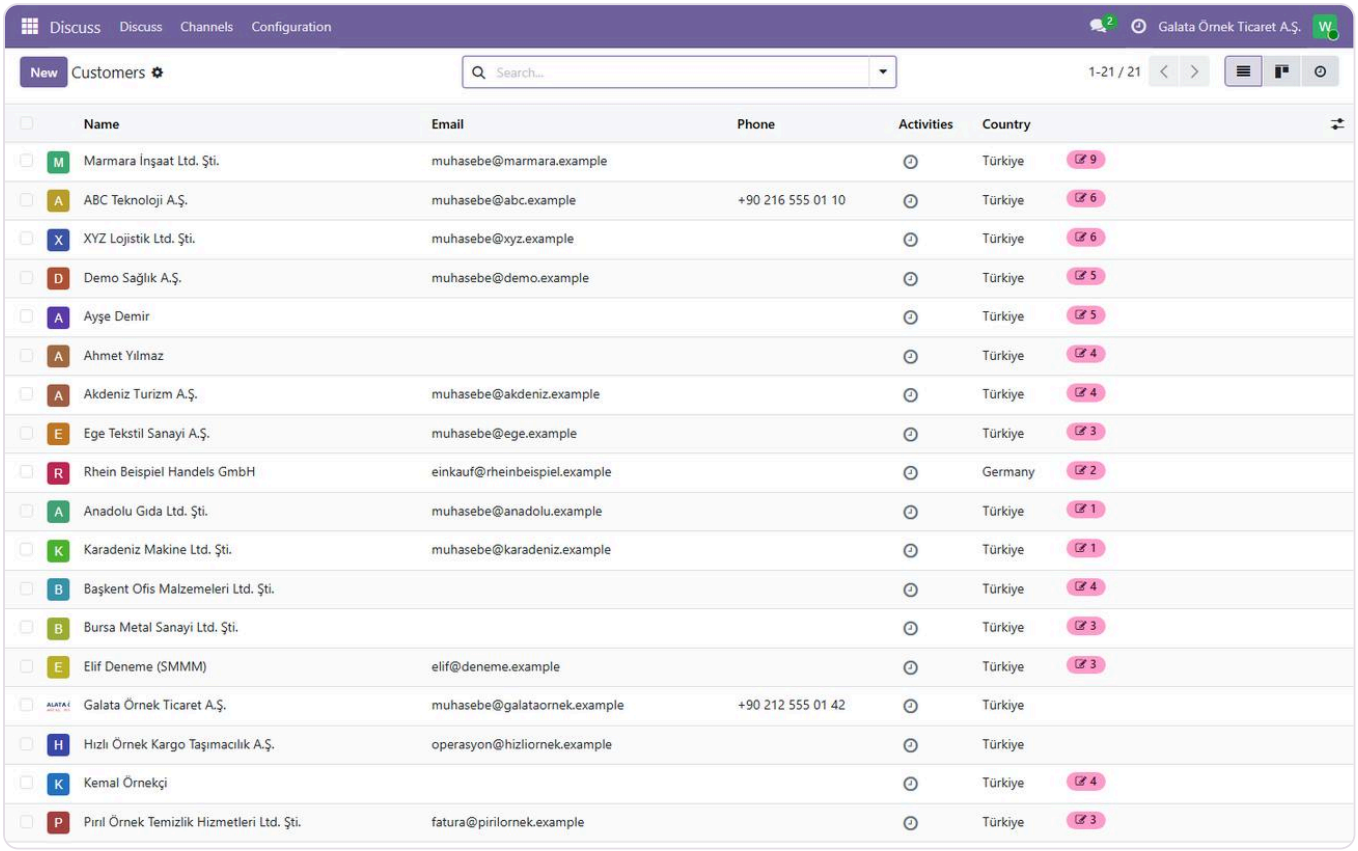

6 Registered for one thing, not another

Ege Tekstil Sanayi A.Ş. is not an e-Fatura user, so its invoices go out as e-Arşiv, and it is not registered for e-İrsaliye either, which is why its delivery note is refused in Part 13.

7 The list, and bulk repair

The contact list has a **VKN / TCKN** column (optional) and the search finds a partner by either number. Select imported partners and use **Actions, Sort VKN / TCKN into the right field** (Turkish System Administrator): an 11-digit number sitting in the VKN box moves to TCKN and the other way round, because the two cannot be valid at the same length.

Name	Email	Phone	Activities	Country	
Marmara İnşaat Ltd. Şti.	muhasebe@marmara.example			Türkiye	9

Hızlı Örnek Kargo Taşımacılık A.Ş.	operasyon@hizliornek.example			Türkiye	
Kemal Örnekçi				Türkiye	4
Pırıl Örnek Temizlik Hizmetleri Ltd. Şti.	fatura@pirilornek.example			Türkiye	3

Scenario per customer

TEMELFATURA is the default: the basic scenario with no response obligation. Set **TICARIFATURA** on the customers you want to answer your invoices, because the scenario commits them to accepting or rejecting within a set period. On the demo XYZ Lojistik is the TICARIFATURA customer.

PART 6 The tax engine: tevkifat, stopaj, exemptions and ÖTV

NEEDS: TAX

Tax rates and ratios in Türkiye are set by communiqué and change. The suite therefore ships no rates of its own: every rule is a record you keep, with the dates it applies and a Verified tick that a Production company insists on.

IN THIS PART YOU WILL LEARN

- The Türkiye tab on an Odoo tax
- A tevkifat rule: ratio, taxes, accounts, scope and dates
- A stopaj rule, and making its tax in one click
- KDV exemption codes and ÖTV rules
- Product defaults, so a line picks the right rule by itself

TRY IT YOURSELF ON THE DEMO

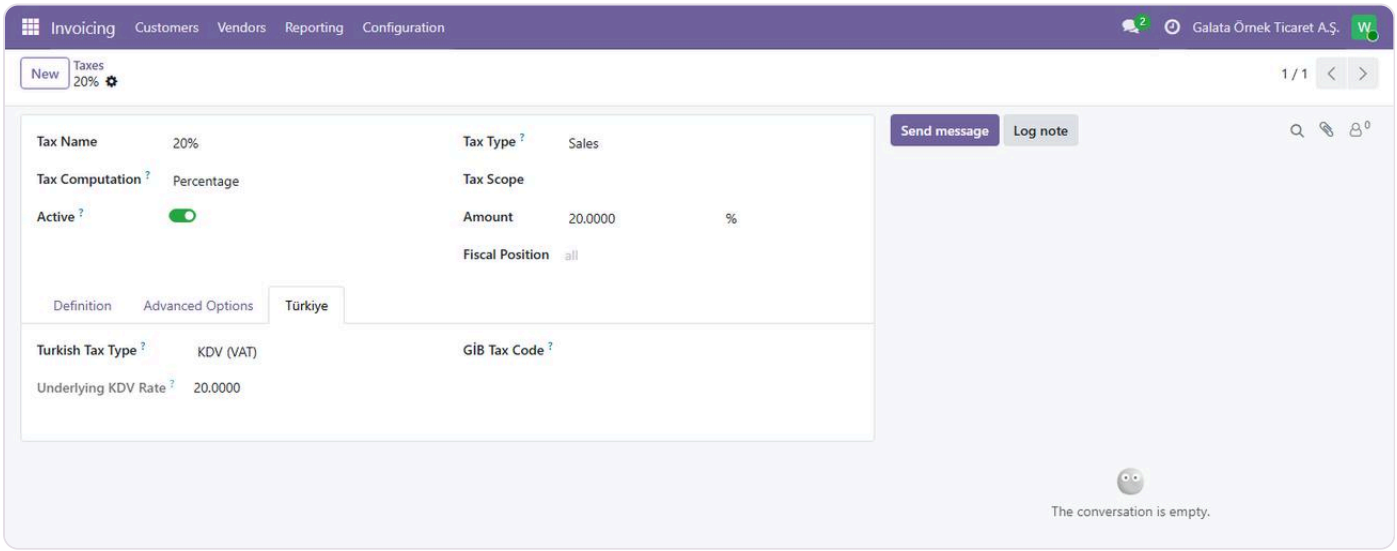

1. Configuration, Taxes, Tevkifat Rules: open DEMO-210
2. Configuration, Taxes, Stopaj Rules: open DEMO-STJ
3. Invoicing, Products: open Kurulum ve Bakım Hizmeti

The taxes Odoo already has

The Türkiye chart loads KDV at 20%, 10% and 1% for sales and purchases, a 0% exempt tax, and tevkifat group taxes named like **WH 20% (2/10)**, one per ratio. The suite does not replace them. It adds a **Türkiye** tab to the tax form and works out each tax's role.

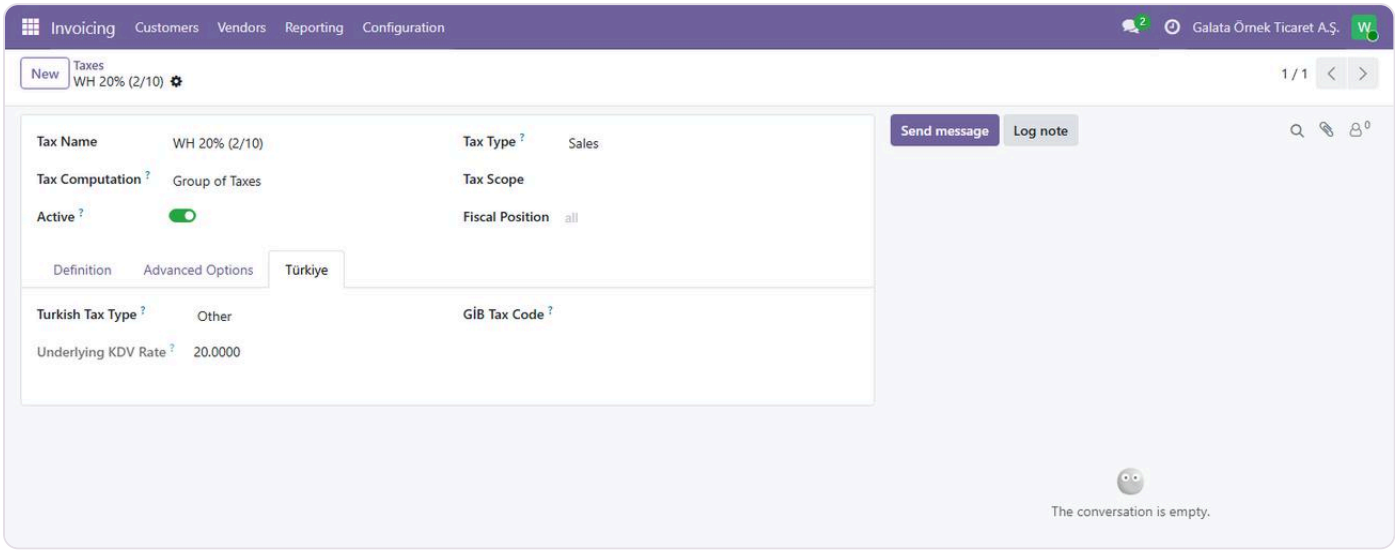

1 The Türkiye tab on a tax

Invoicing, Configuration, Taxes, open **20%**. **Turkish Tax Type** is KDV, KDV Exempt (İstisna), KDV Tevkifat, Stopaj, ÖTV or Other, filled in from the tax itself. **Underlying KDV Rate** is the rate behind it. **GİB Tax Code** is the code the tax reports under in the UBL. A zero-rated tax can carry a **Default Exemption Code**.

2 A tevkifat group tax

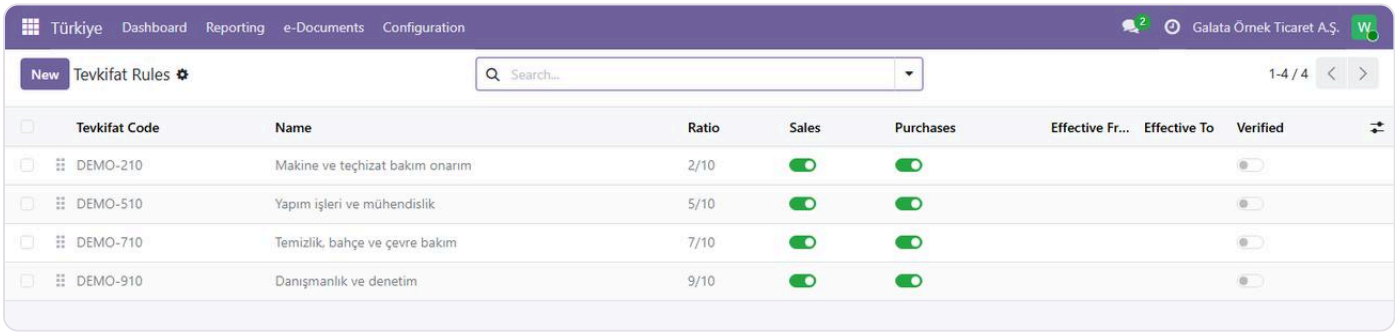

WH 20% (2/10) is a group of the 20% KDV and a negative child of -4%, which is the 2 tenths the buyer withholds. Its tab lists the tevkifat rules that use it.

Tevkifat rules

3 Configuration, Taxes, Tevkifat Rules

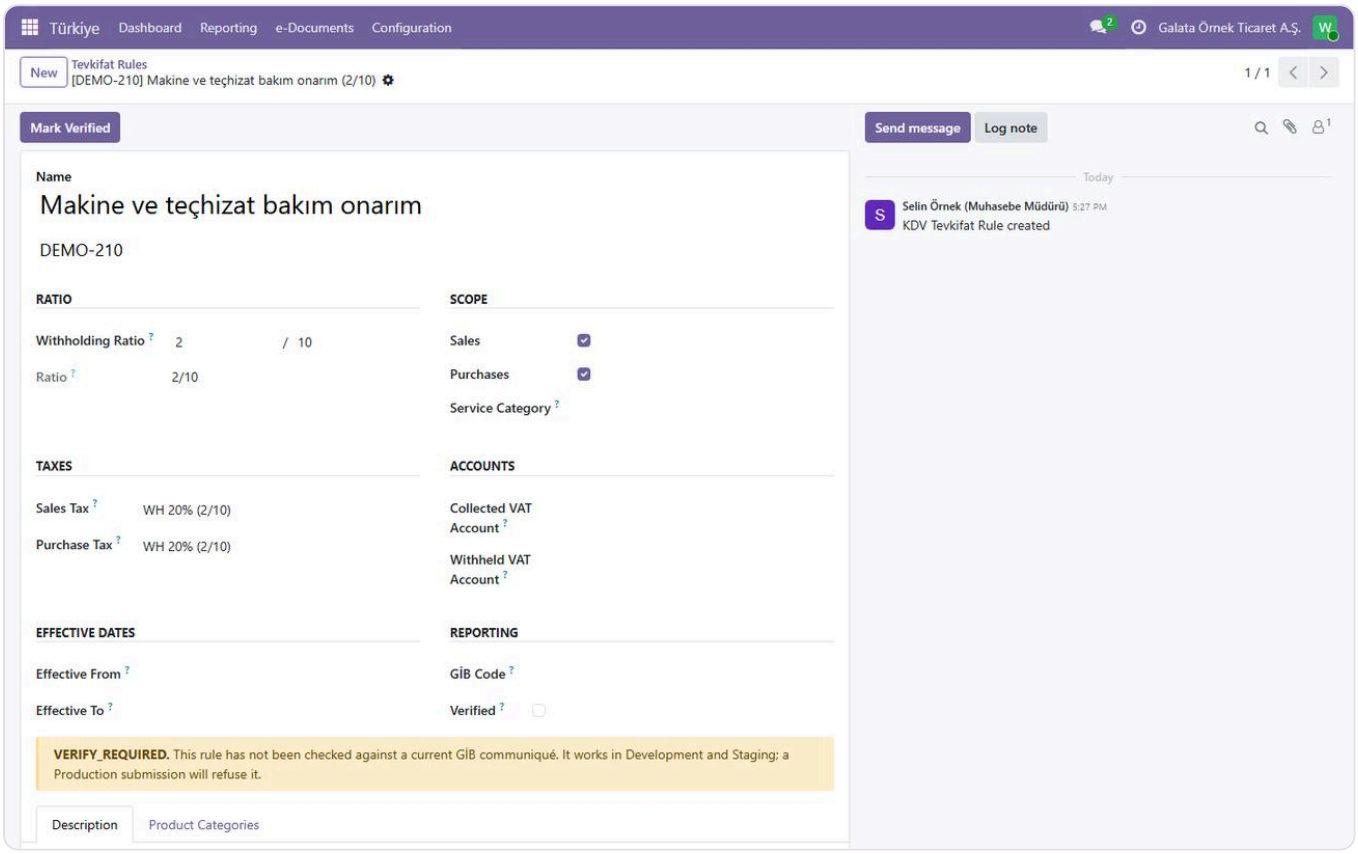

Code, name, ratio, sales and purchase taxes, dates and Verified. The demo has four illustrative rules: 2/10 machinery maintenance, 5/10 construction, 7/10 cleaning and 9/10 consultancy.

4 A rule

Name and **Code** (the GİB code can be kept separately in **GİB Code**). The ratio is **Numerator / Denominator**, here 2/10, shown as a ratio and a decimal. **Sales** and **Purchases** say where the rule may be used. **Sales Tax** and **Purchase Tax** are the Odoo taxes it puts on the line. Optional **Seller Account** and **Withholding Account**, a **Service Category**, product categories on their own tab, and **Effective From / To**. **Mark Verified** records who confirmed it against a current GİB publication.

The ratio must be above zero and no more than one. Rules are tracked, so every change shows in the chatter.

Stopaj rules

5 Configuration, Taxes, Stopaj Rules

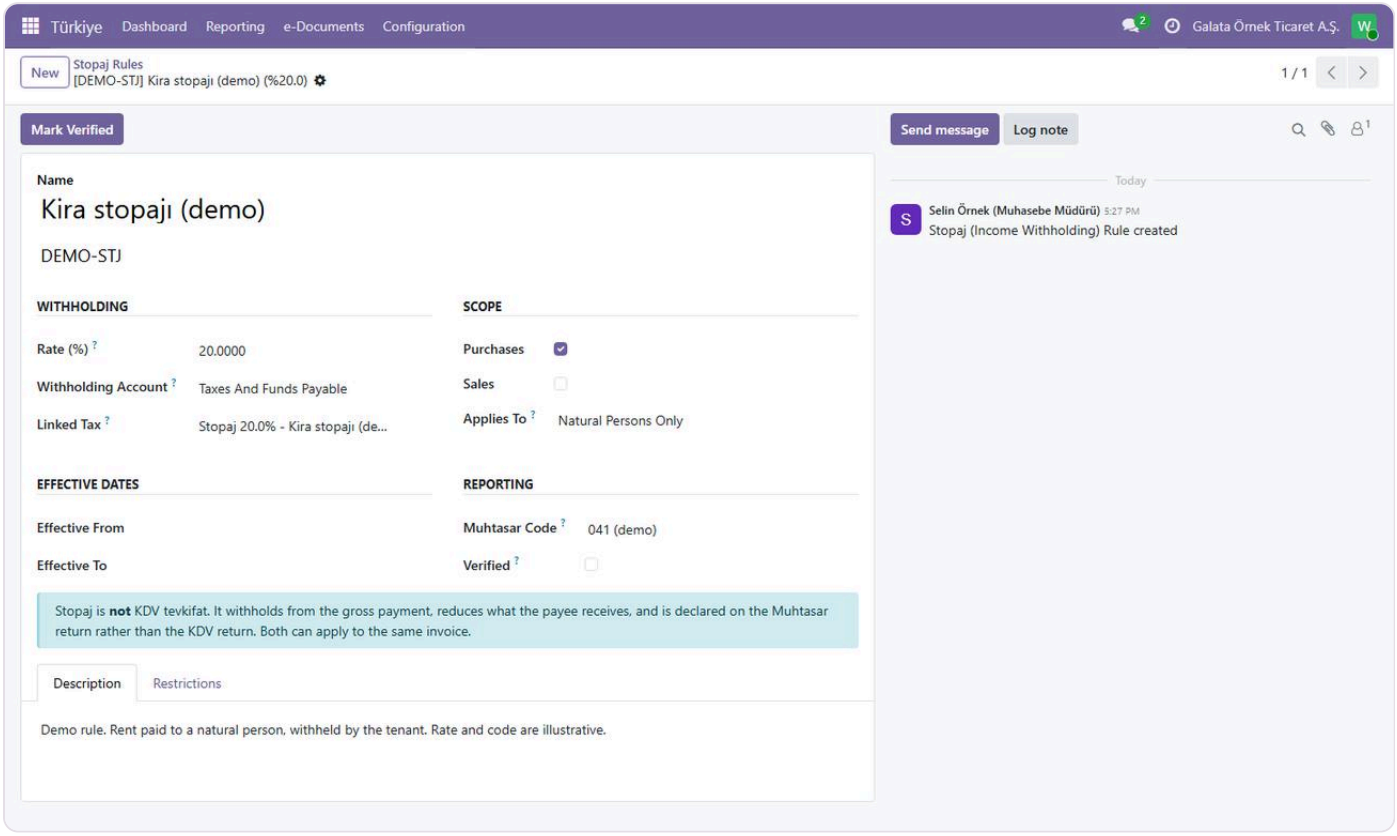

The demo has two: rent paid to a person (DEMO-STJ) and fees paid to a self-employed accountant (DEMO-SMM), both 20% and both unverified.

6 A rule

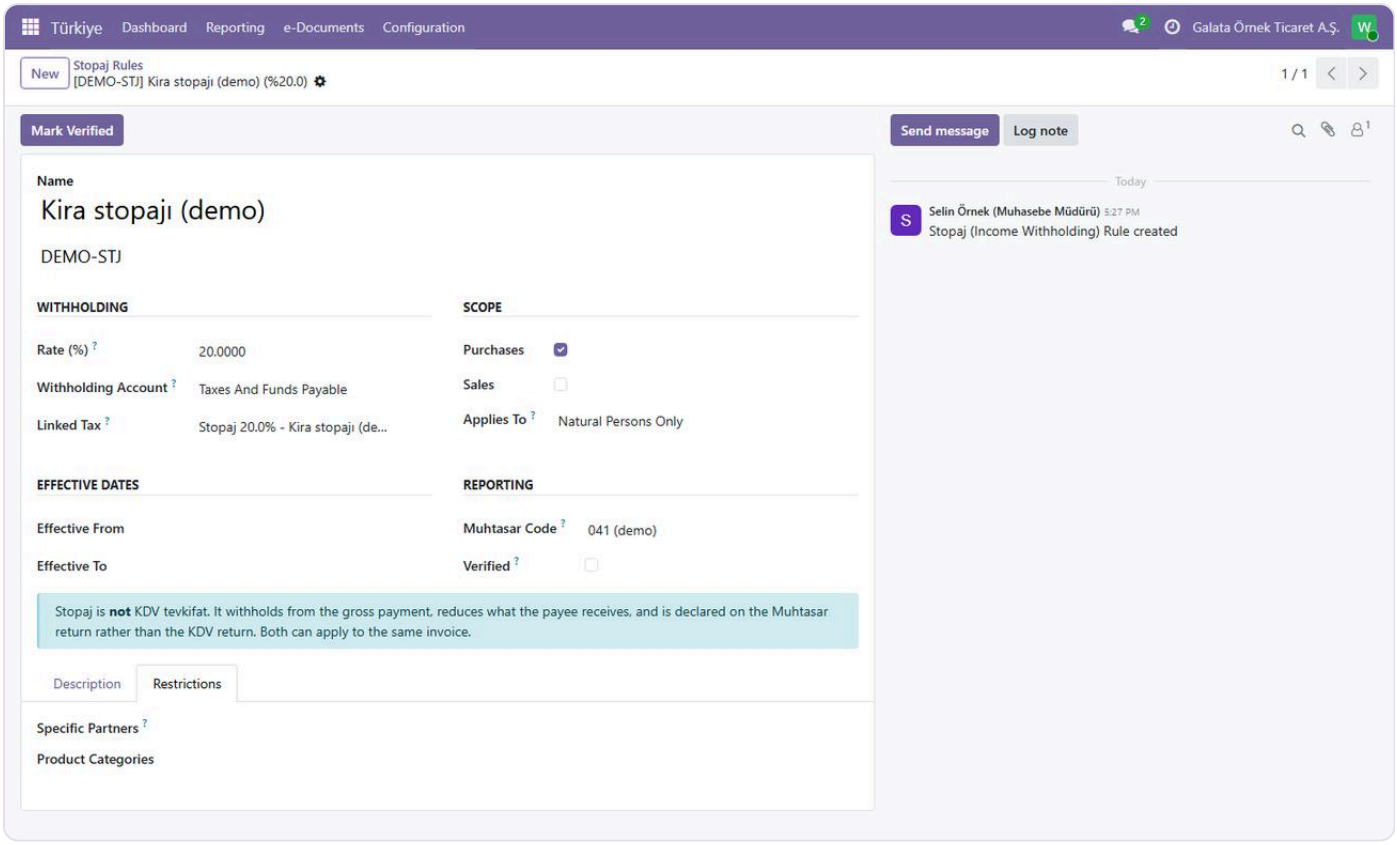

Rate, **Withholding Account** (where the withheld amount posts), the linked **Tax**, Sales and Purchases (purchases by default), **Muhtasar Code** for the declaration line, dates and Verified. **Create Matching Tax** makes a negative-rate Odoo tax from the rule, once; pressing it again does nothing.

On the demo the withholding account is 360 Ödenecek Vergi ve Fonlar. Odoo's Turkish chart types 360 as a payable account, and a payable account needs a due date on every line, so a tax posting there will not save. We changed 360 to a current liability on the demo; do the same, or pick another account, before you create the tax.

7 Restrictions

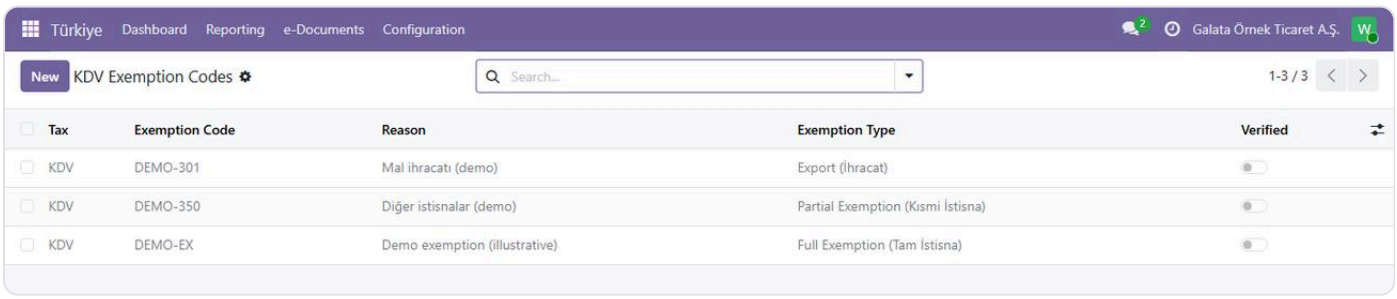

Applies To: Any, Legal Entities Only or Natural Persons Only (this is where the VKN/TCKN split pays off), specific partners, and product categories. A bill line whose partner does not fit gets a warning.

KDV exemption codes and ÖTV

8 KDV Exemption Codes

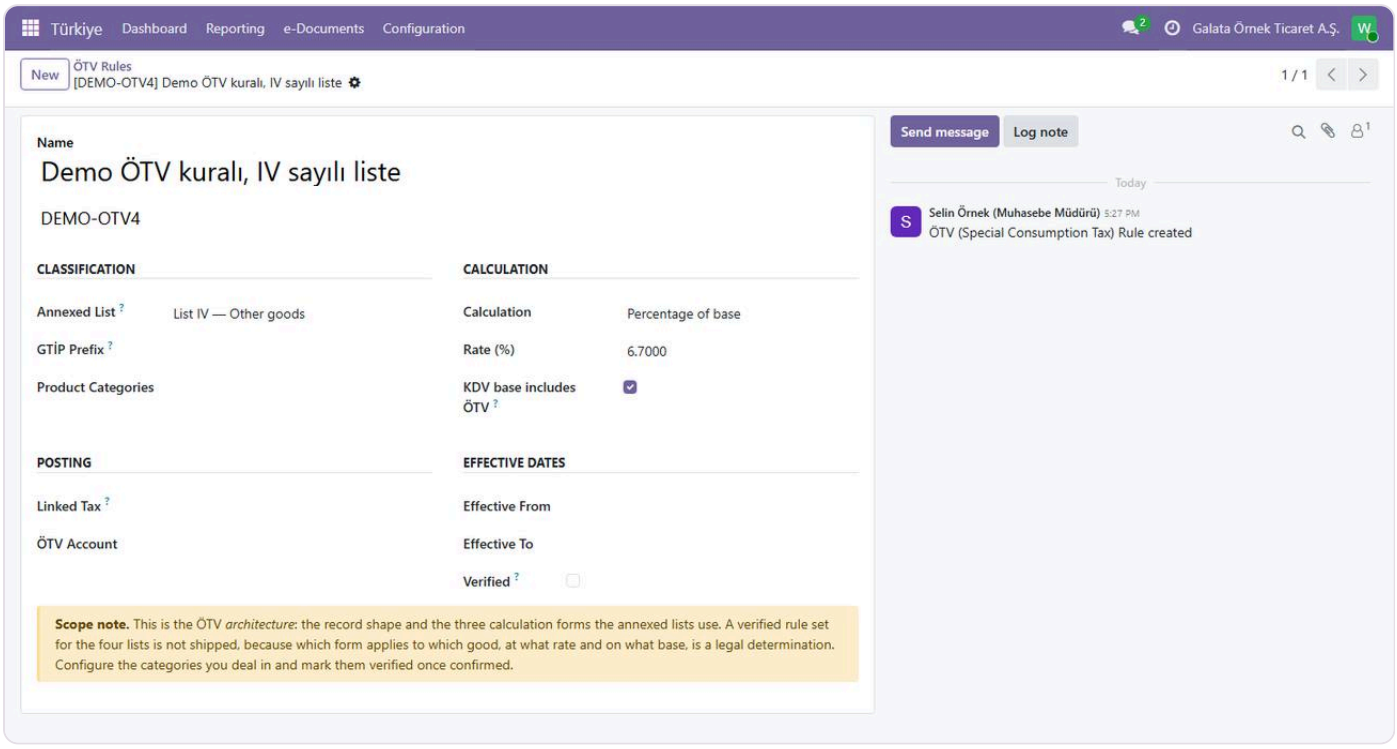

A code, the reason, the tax it exempts from (KDV, ÖTV or other), the type (full, partial, export, other), dates and Verified. Full exemption keeps the right to reclaim input KDV, partial does not. A line with a 0% exempt tax and no code gets a warning.

9 ÖTV Rules

The annexed list (I petroleum, II vehicles, III alcohol and tobacco, IV other goods), the method (percentage, fixed per unit, or percentage with a per-unit minimum), rate, amount, unit, minimum, whether the KDV base includes ÖTV, product categories, a GTİP prefix, linked tax and account, dates and Verified.

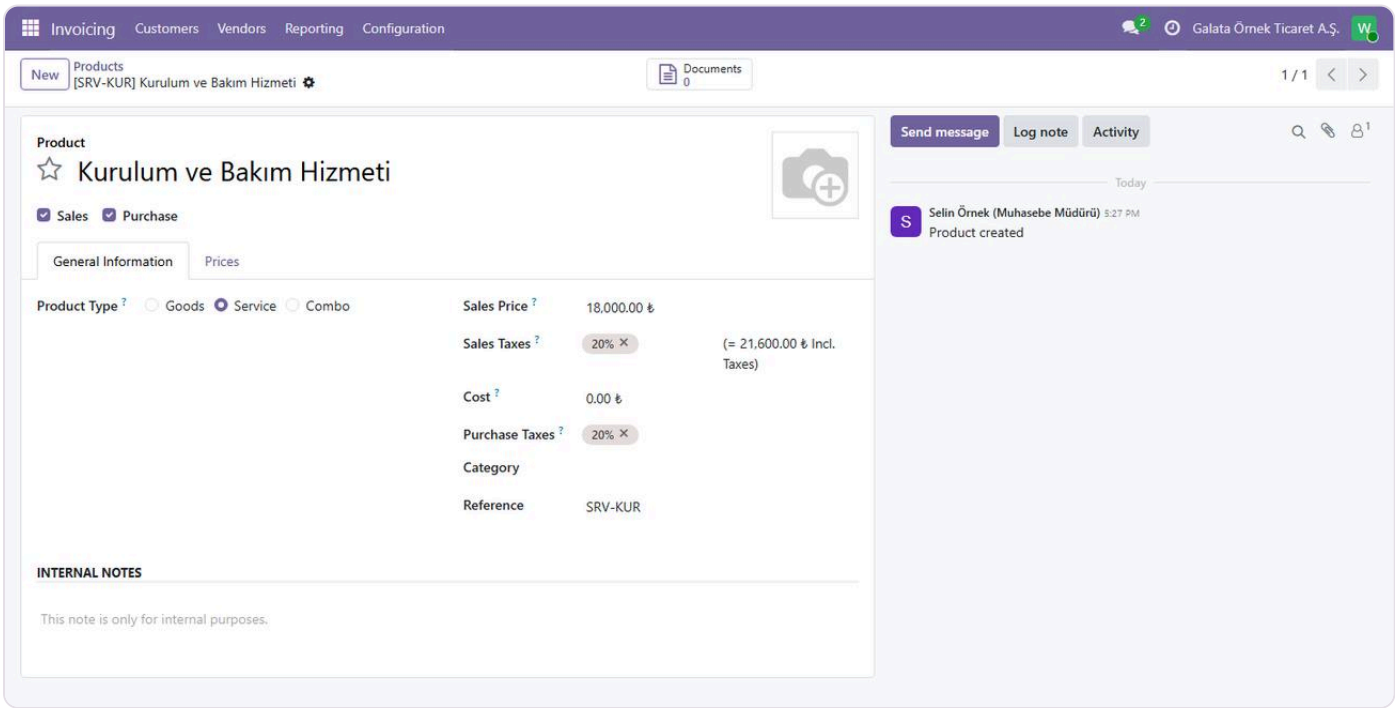

In this version ÖTV rules are configuration only: nothing on an invoice line reads them yet. Post ÖTV with an ordinary Odoo tax.

Product defaults

10 The Türkiye group on a product

Tevkifat Rule, **Stopaj Rule**, **Exemption Code** and the **GTİP Code** (customs tariff). When the product is put on an invoice line the rules are filled in, without overwriting a choice already made. On the demo the installation service carries the 2/10 rule and the cleaning service the 7/10 rule.

PART 7 Invoices and bills with Turkish tax

NEEDS: TAX

On the invoice nothing new is asked of the user. Pick the product; the line takes its rule; the invoice shows what was charged, what the buyer withholds and what is actually collected.

IN THIS PART YOU WILL LEARN

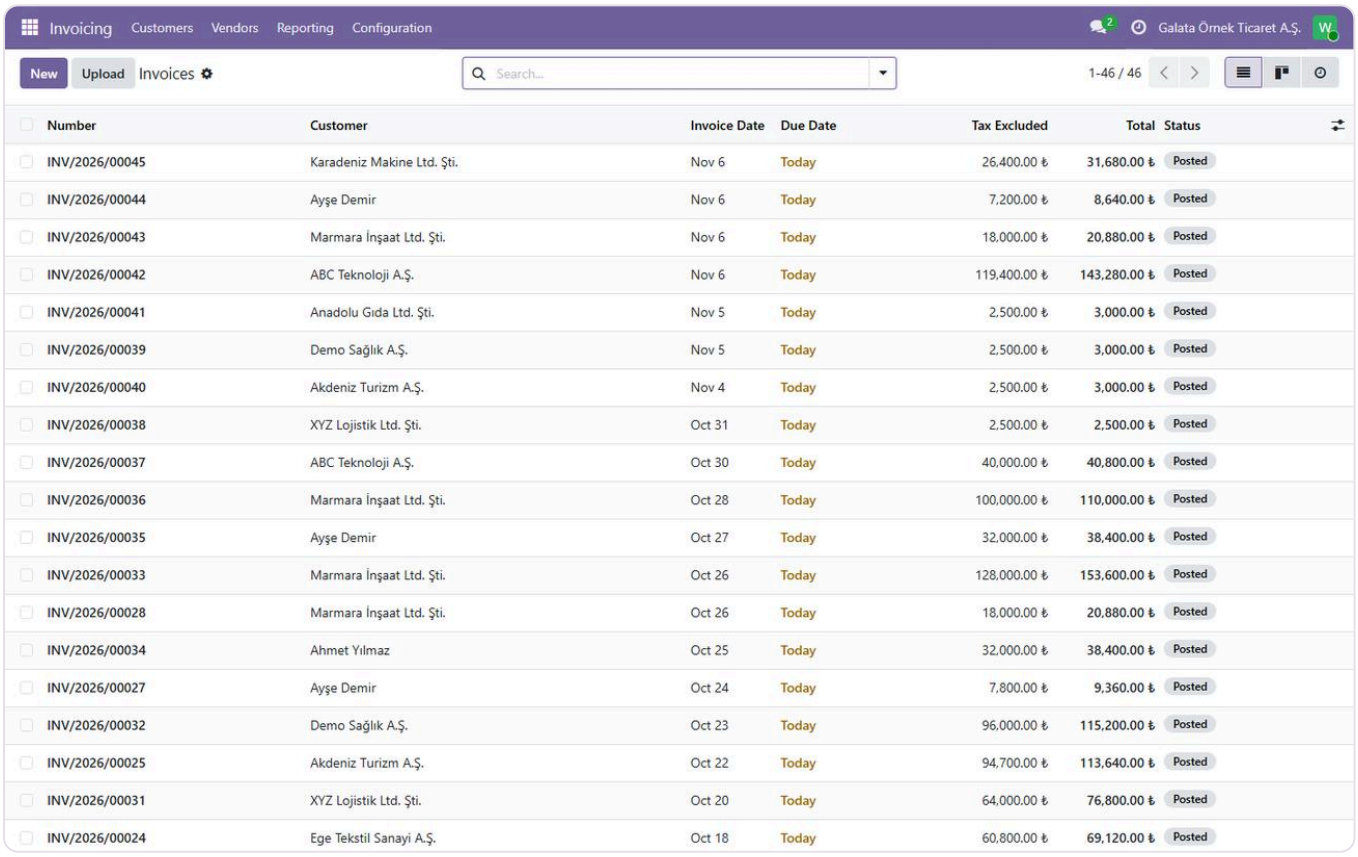

- A sales invoice with tevkifat, and the KDV split it shows
- An exempt export line with its code
- A rent bill with stopaj, and a cleaning bill with purchase tevkifat
- The warnings the engine raises before anything is sent

TRY IT YOURSELF ON THE DEMO

1. Invoicing, Customers, Invoices: open INV/2026/00043 (Marmara İnşaat)
2. Scroll to the totals and read the Turkish summary
3. Vendors, Bills: open the October rent from Kemal Örnekçi

1 The invoices

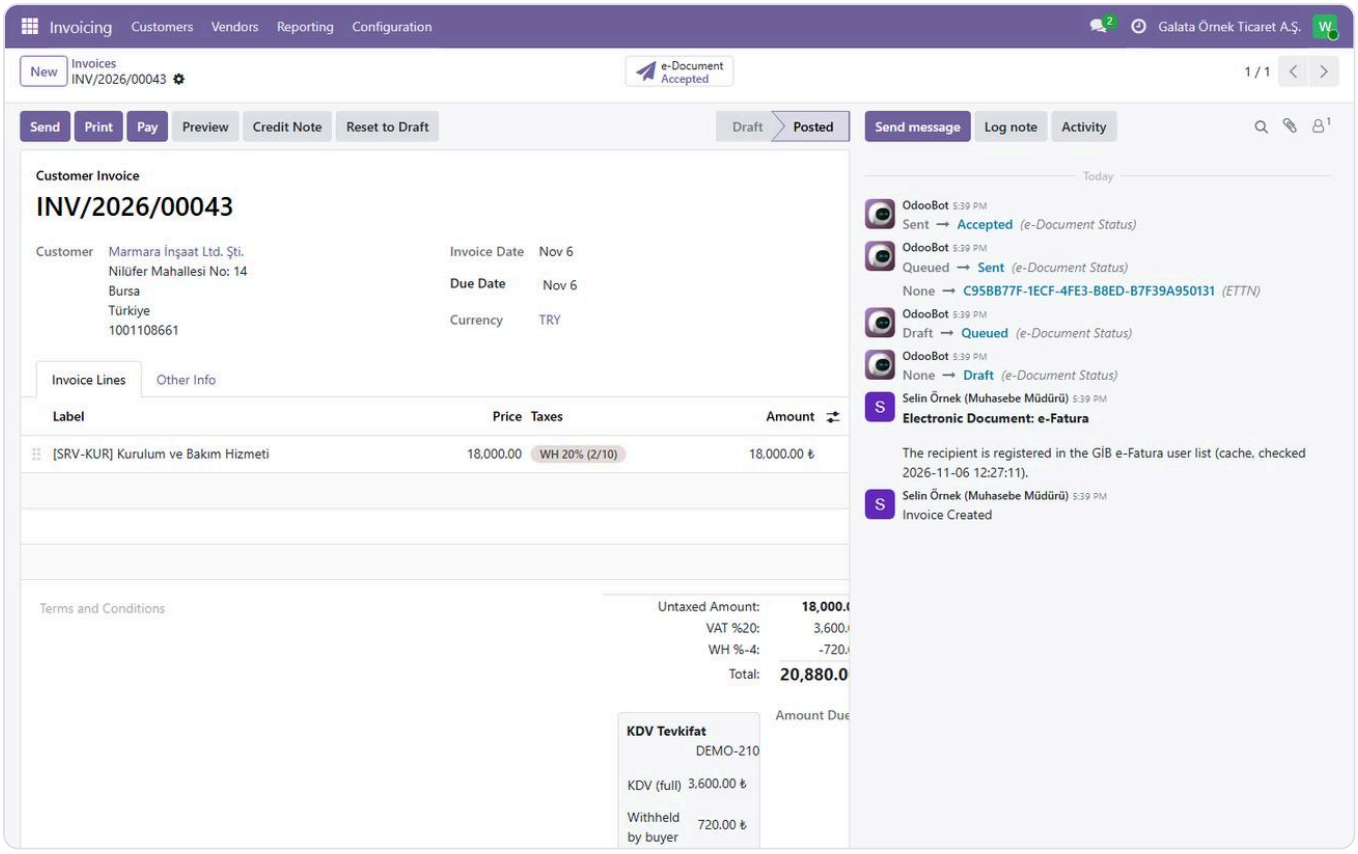

Invoicing, Customers, Invoices. The demo has three months of sales from August, plus today's.

Number	Customer	Invoice Date	Due Date	Tax Excluded	Total	Status

INV/2026/00024	Ege Tekstil Sanayi A.Ş.	Oct 18	Today	60,800.00 ₺	69,120.00 ₺	Posted

2 A tevkifat line

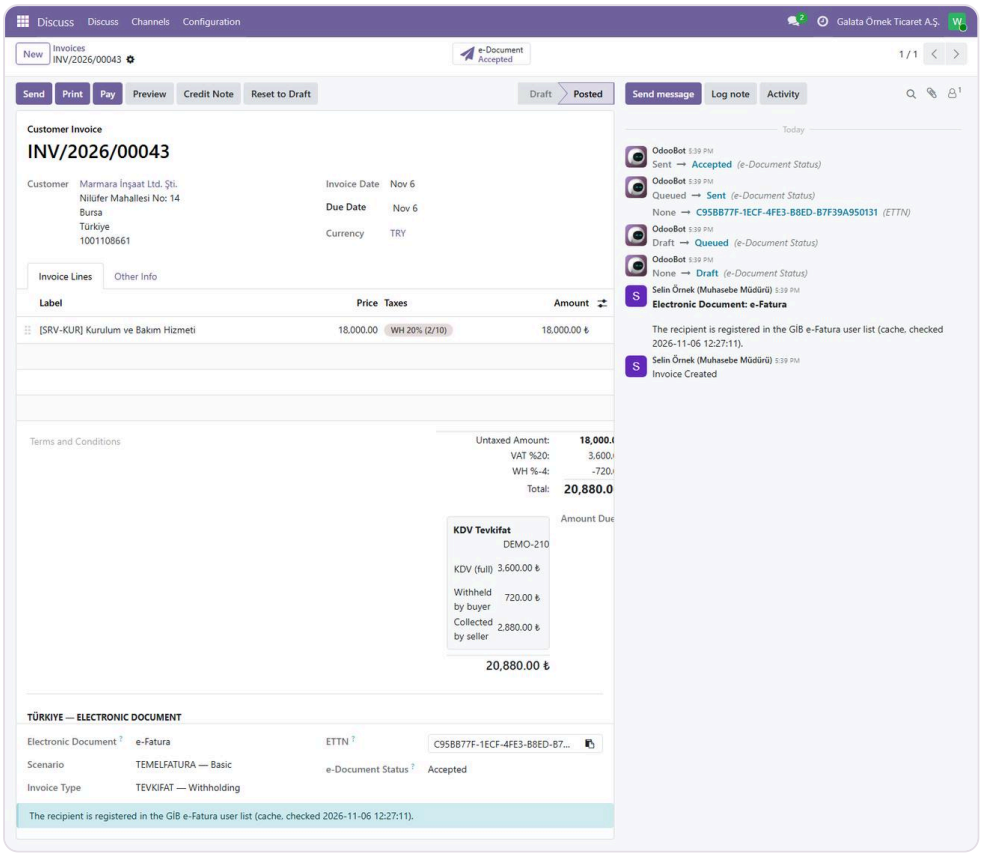

INV/2026/00043: one installation and maintenance service, 18,000 TRY. The line columns **Tevkifat**, **Stopaj** and **Exemption** can be shown from the optional columns menu. Choosing the rule swaps the line's tax for the rule's group tax, so the KDV is not charged twice.

3 The Turkish summary

Under the totals: **KDV calculated** 3,600, **Tevkifat withheld** by the buyer 720 (2 tenths), **KDV collected** 2,880 (8 tenths), the tevkifat codes used, and the stopaj total. The customer owes 20,880. Any Turkish tax problems are listed underneath in plain sentences.

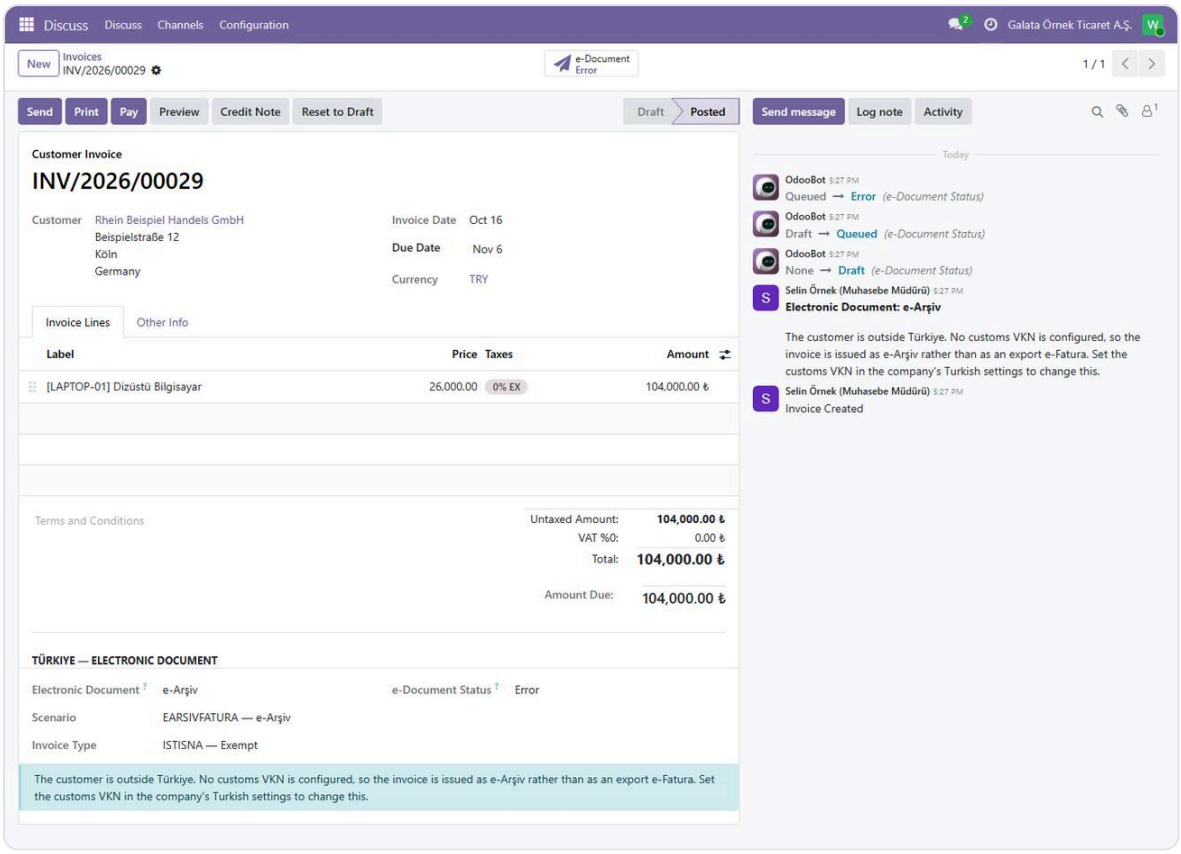

The invoice's e-document type becomes TEVKIFAT by itself, and the split is written into the UBL-TR (Part 9).

4 An exempt export line

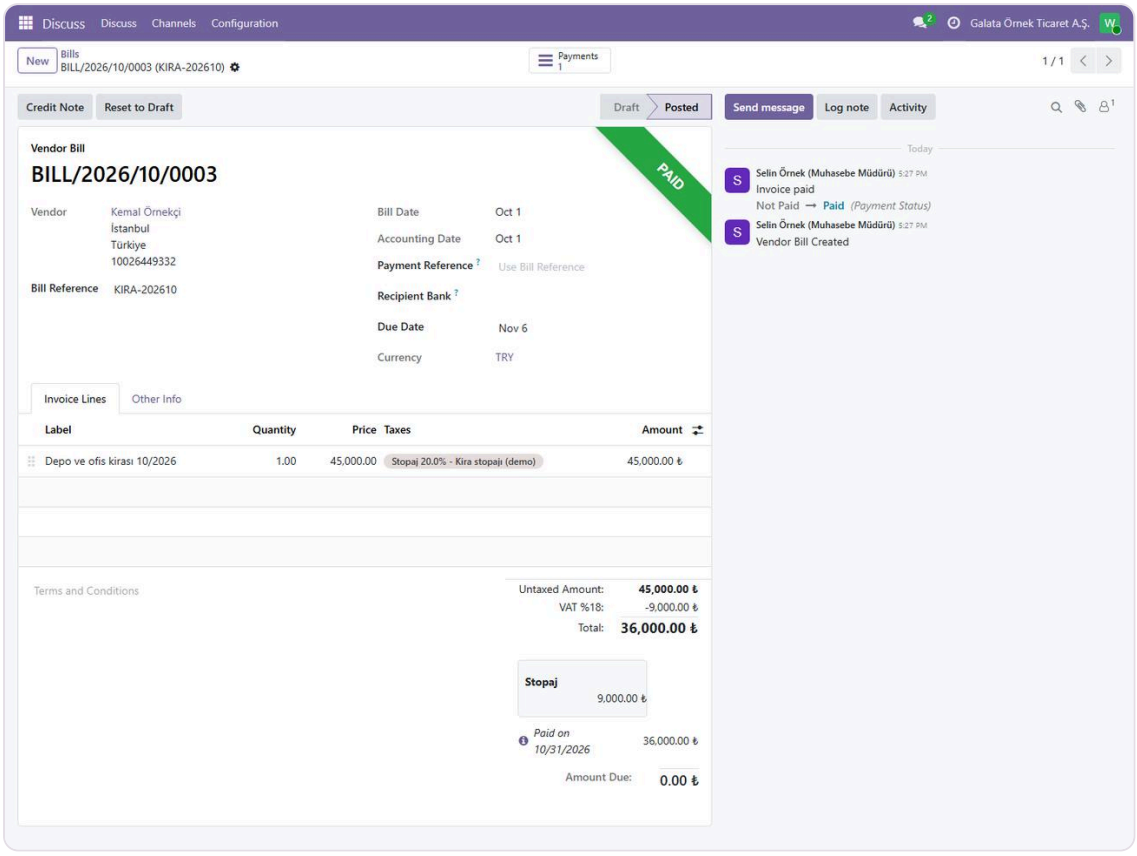

An invoice to Rhein Beispiel Handels GmbH in Köln, at 0% EX with the exemption code DEMO-301. All product lines exempt makes the invoice type ISTISNA.

See Part 10 for why this one is in the error queue.

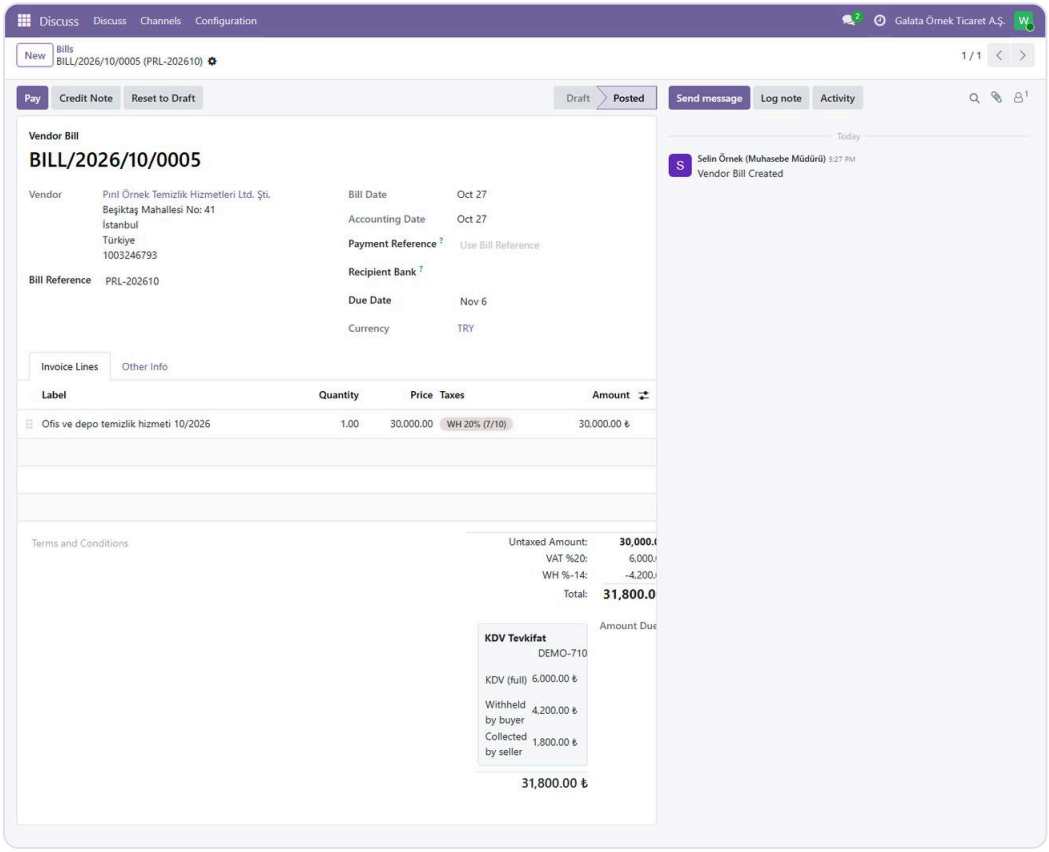

5 Rent with stopaj

The October rent from Kemal Örnekçi, a natural person: 45,000 TRY gross, stopaj 20% (9,000) withheld, 36,000 payable to the landlord. The withheld amount posts to 360 and lands on the Muhtasar dataset.

6 Cleaning with purchase tevkifat

Pırıl Örnek Temizlik's October bill: 30,000 plus KDV 6,000, of which we withhold 7 tenths (4,200) as the buyer and pay the supplier 31,800. The 4,200 is what KDV-2 reports.

What the engine checks

Before an invoice is sent the tax engine lists, in sentences, every line with an exempt tax but no exemption code, a code or rule outside its dates, a tevkifat rule with no tax for this kind of document, a stopaj rule with neither account nor tax, a stopaj rule used for a partner it does not apply to, and, on a Production company, anything not Verified.

Payment Communication: **INV/2026/00043**

The printed invoice is Odoo's standard layout; the legal document in Türkiye is the e-invoice itself and the GİB PDF that comes back with it (Part 9).

PART 8 The e-document engine and the integrator

NEEDS: **E-DOC CORE**

Every Turkish e-document, whatever its type, is one record with one lifecycle. The engine builds the UBL-TR, validates it, hands it to an integrator in the background, and records every request and answer.

IN THIS PART YOU WILL LEARN

- The lifecycle, from Draft to Accepted
- The integrator record, and what the mock integrator is for
- Why this version needs an adapter written before it can go live
- UBL-TR schema versions and the Verified tick
- Background jobs, retries and the dead-letter state

TRY IT YOURSELF ON THE DEMO

1. Configuration, e-Documents, Integrators: open Mock GİB (development)
2. Configuration, e-Documents, UBL-TR Schema Versions: Required Elements tab
3. Configuration, Technical, Background Jobs

The lifecycle of an e-document

1. **Draft** — created when the invoice or delivery is posted
2. **Queued** — Send pressed, or sent automatically
3. **XML Generated** — validated, numbered, UBL-TR built
4. **Sent** — the integrator took it
5. **Accepted** — GİB answered yes; Delivered for incoming

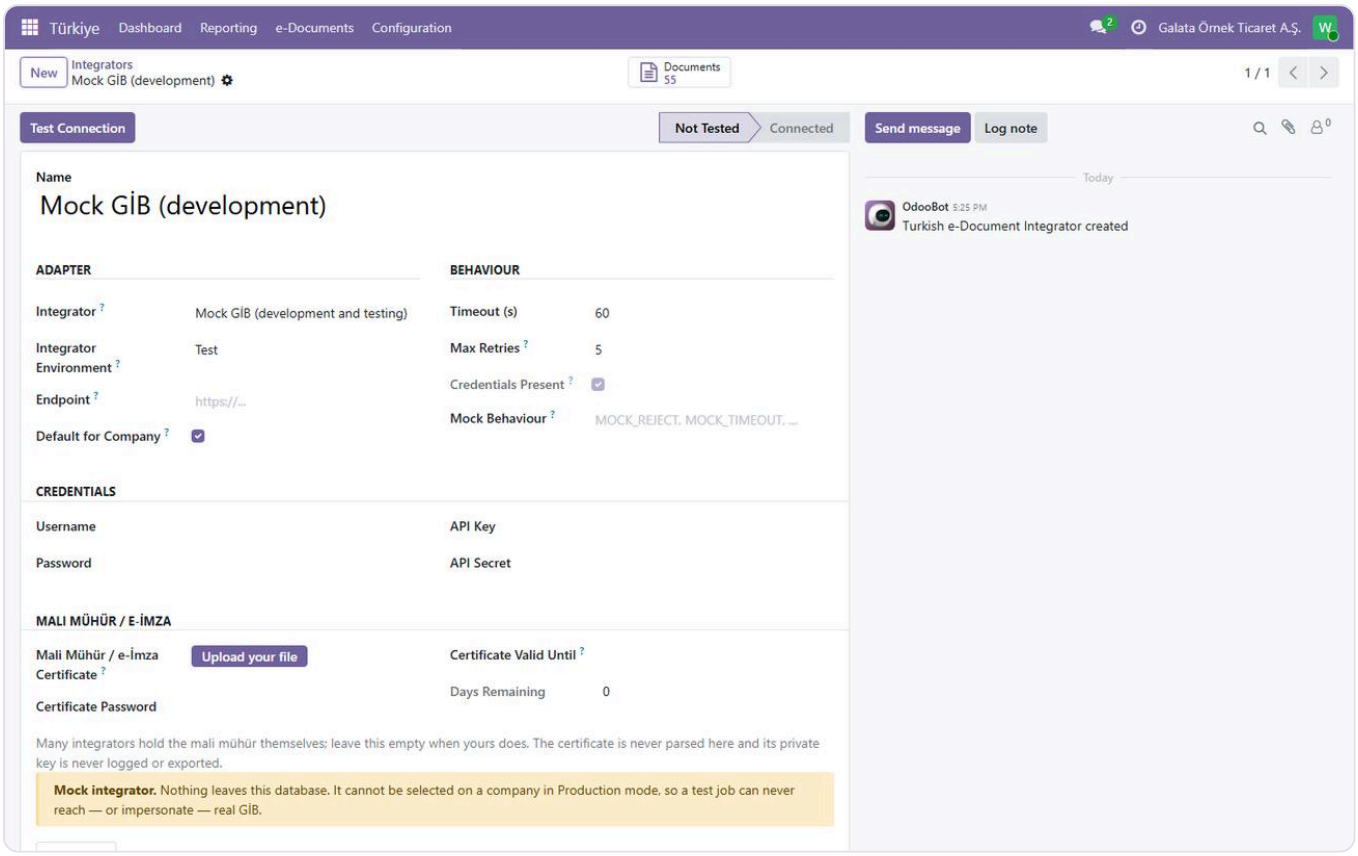

Off the main path a document can be **Rejected** (a business refusal, never retried), in **Error** (a technical failure, retried with a back-off), or **Cancelled**. A failure on the way never stops the invoice itself from posting: accounting comes first, transmission is a separate step that can be repeated.

The integrator

1 Configuration, e-Documents, Integrators

One record per integrator connection: name, company, **Integrator** type, default flag, endpoint, environment, credentials (username, password, API key and secret, visible only to the GİB Integration Manager), the mali mühür certificate with its password and expiry date, **Timeout**, **Max Retries** (default 5) and, for the mock, **Mock Behaviour**. **Test Connection** runs authentication, a health check and a user lookup and reports each separately on the **Last Test** tab.

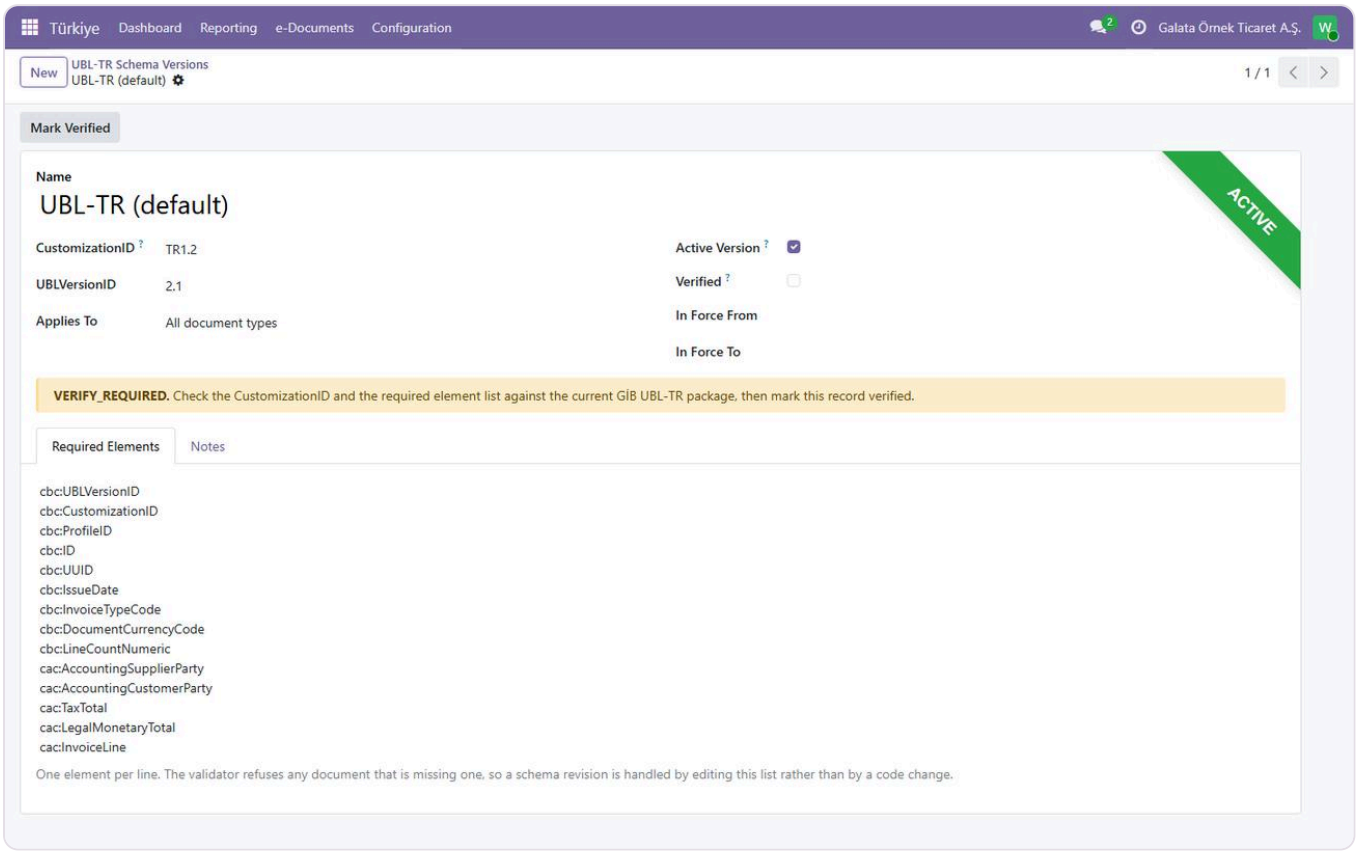

The certificate expiry date feeds a days-left count, so a mali mühür that is about to expire shows up before documents start failing.

The mock integrator, and going live. The engine talks to integrators through one interface, and in this version the only adapter that ships is **Mock GİB**. It never leaves the database: it keeps its own state, returns a real openable PDF, and can be told to fail the way a real integrator fails. A marker in the partner reference, the partner name or the invoice notes drives it: MOCK_REJECT, MOCK_PENDING, MOCK_TIMEOUT, MOCK_AUTH_FAIL, MOCK_INVALID_XML, MOCK_RATE_LIMIT or MOCK_SERVER_ERROR. The same marker on the integrator record makes every document behave that way. The mock is refused on a Production company. To send real documents, an adapter for your özel entegratör (or the GİB portal) has to be written against this interface; it is a class registered with one decorator, and then it appears in the Integrator list. Every screenshot in this guide comes from the mock: **nothing was sent to GİB**.

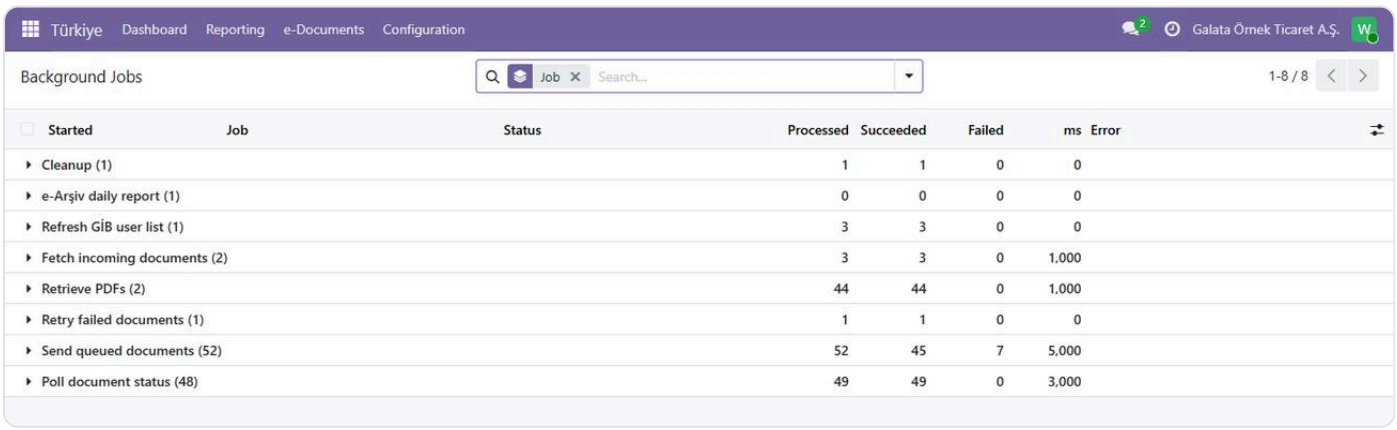

2 UBL-TR Schema Versions

The CustomizationID (TR1.2), the UBL version (2.1), the document type it covers, Active and Verified, and on **Required Elements** the elements the validator insists on. **Make Active** and **Mark Verified** (Turkish System Administrator). The version ships unverified, so a Production company refuses to send until somebody has checked it against the current GİB package.

3 Background jobs

Configuration, Technical, Background Jobs. Each scheduled run leaves a row: job, company, start and end, how many succeeded and failed, and any error. The jobs and how often they run:

SCHEDULED JOB	EVERY	DOES
Türkiye: send queued e-documents	2 minutes	Builds and transmits what is queued, in batches
Türkiye: poll e-document status	15 minutes	Asks the integrator about sent documents
Türkiye: retry failed e-documents	10 minutes	Retries technical failures whose wait is over
Türkiye: retrieve e-document PDFs	30 minutes	Fetches the GİB PDF for accepted documents
Türkiye: fetch incoming e-documents	30 minutes	Imports new incoming invoices

Türkiye: refresh GİB user list	1 day	Pulls the registered-user list into the cache
Türkiye: e-Arşiv daily report	1 day	Collects and sends yesterday's e-Arşiv report
Türkiye: e-document cleanup	1 day	Trims old request logs and job rows (90 days)
Türkiye: vacuum audit trail	1 month	Removes audit entries older than 24 months

A technical failure is retried after 1, 2, 4, 8 minutes and so on, capped at 60, up to the integrator's Max Retries. After the last attempt the document is marked as needing attention (dead letter), posts a note saying so and waits for a person. A business rejection is never retried.

PART 9 e-Fatura and e-Arşiv: from invoice to accepted

NEEDS: E-FATURA

The user never chooses between e-Fatura and e-Arşiv. They post an invoice; the system reads the customer's VKN, checks the GİB list, picks the document, writes down why, numbers it and sends it.

IN THIS PART YOU WILL LEARN

- The routing decision and the reason written on the invoice
- Scenario and invoice type, worked out for you
- Sending, and what the console shows while it happens
- The e-document form: parties, GİB, transmission, timeline, XML, log
- Getting the GİB PDF

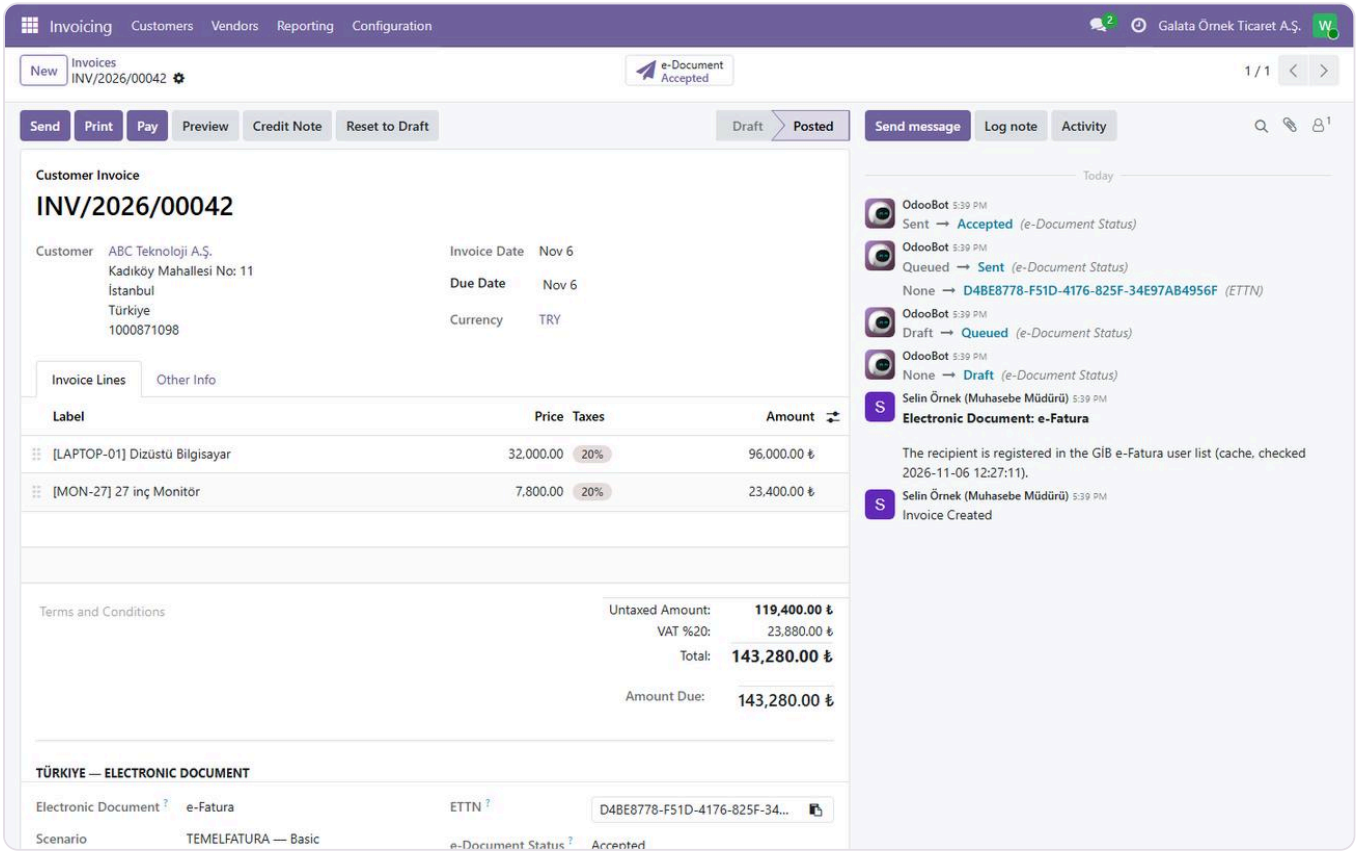

TRY IT YOURSELF ON THE DEMO

1. Invoicing: open INV/2026/00042 (ABC Teknoloji), read Routing Reason
2. Press the e-Document smart button, then open the Console tab
3. e-Documents, Outbox

On the invoice

1 Post the invoice

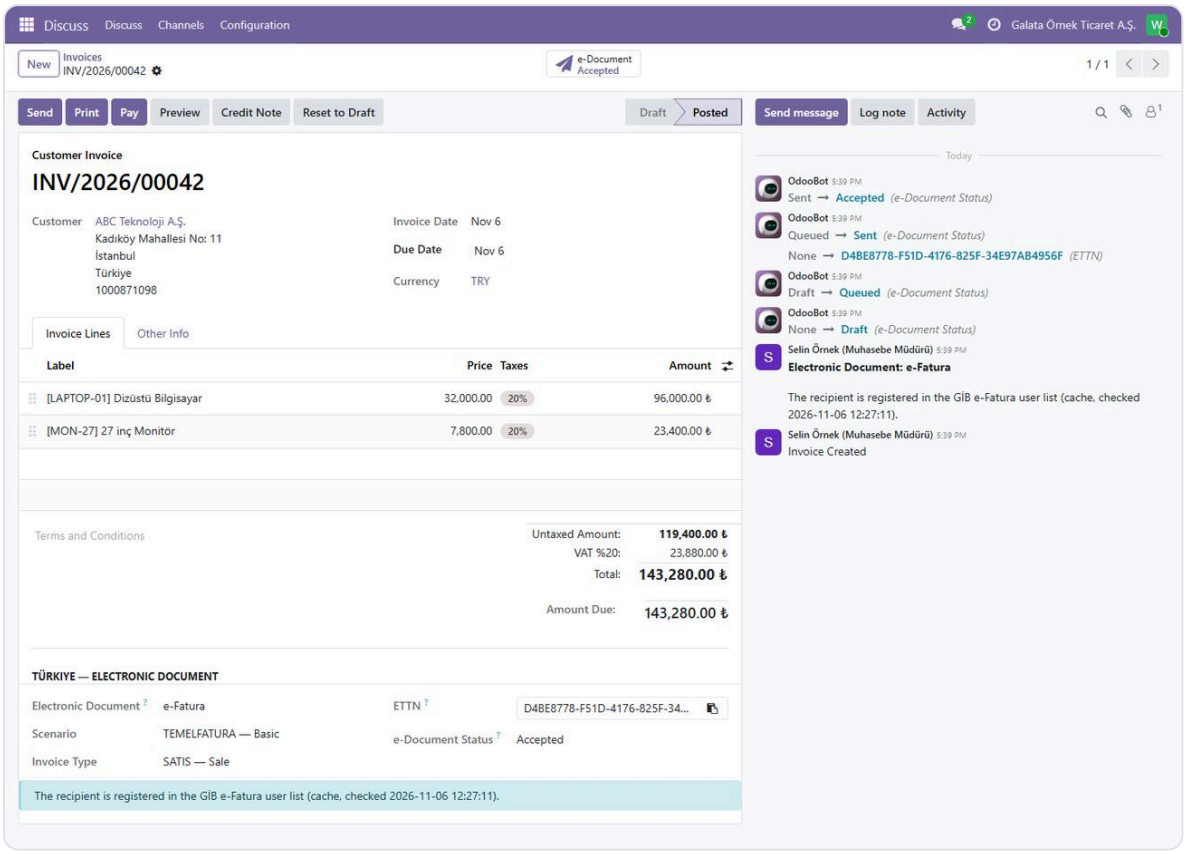

Nothing Turkish is asked for. Post as usual. The **e-Document** smart button appears with the document's status.

2 Türkiye, Electronic Document

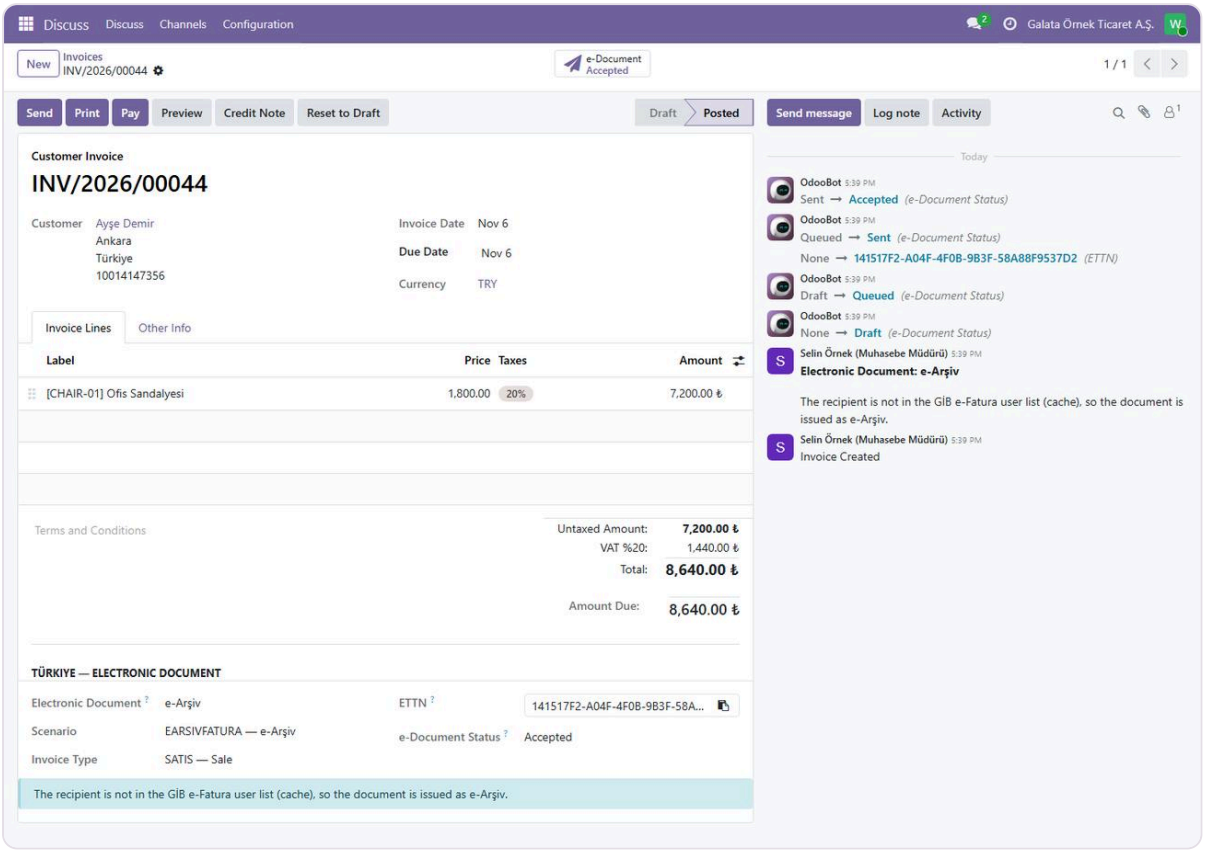

Electronic Document: e-Fatura or e-Arşiv. **Routing Reason**, in words: here "The recipient is registered in the GİB e-Fatura user list (demo, checked ...)". **Scenario** and **Invoice Type**, both derived. **ETTN** with a copy button once numbered, and the status. Before posting, **Re-check** recalculates the routing.

An e-Document Manager may change the document type by hand where it is legally right. The change is flagged as Routing Overridden on the invoice and written to the audit trail, and a recompute does not undo it.

3 An e-Arşiv invoice

INV/2026/00044 to Ayşe Demir, a person with a TCKN who is not on the list: e-Arşiv, scenario EARSIVFATURA.

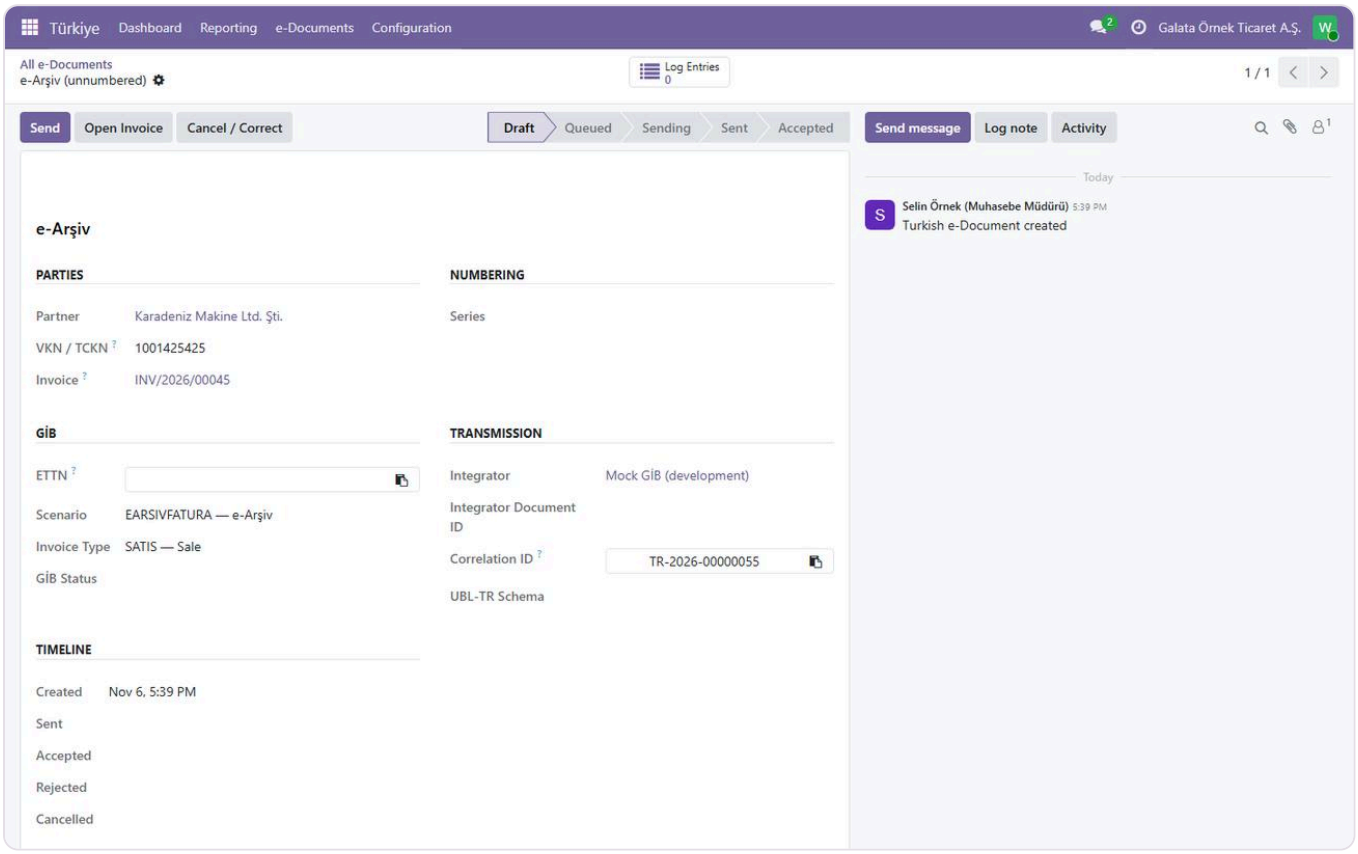

ROUTING RULE	RESULT
Customer outside Türkiye, customs VKN set on the company	e-Fatura, scenario IHRACAT
Customer outside Türkiye, no customs VKN	e-Arşiv, and the reason says to set the customs VKN
No VKN or TCKN on the customer	e-Arşiv, because registration cannot be checked
On the GİB e-Fatura list	e-Fatura; TICARIFATURA if set on the customer, else TEMELFATURA
Not on the list	e-Arşiv
Credit note	Invoice type IADE
A line with tevkifat	Invoice type TEVKIFAT
Every product line exempt	Invoice type ISTISNA

Sending

4 A document waiting to be sent

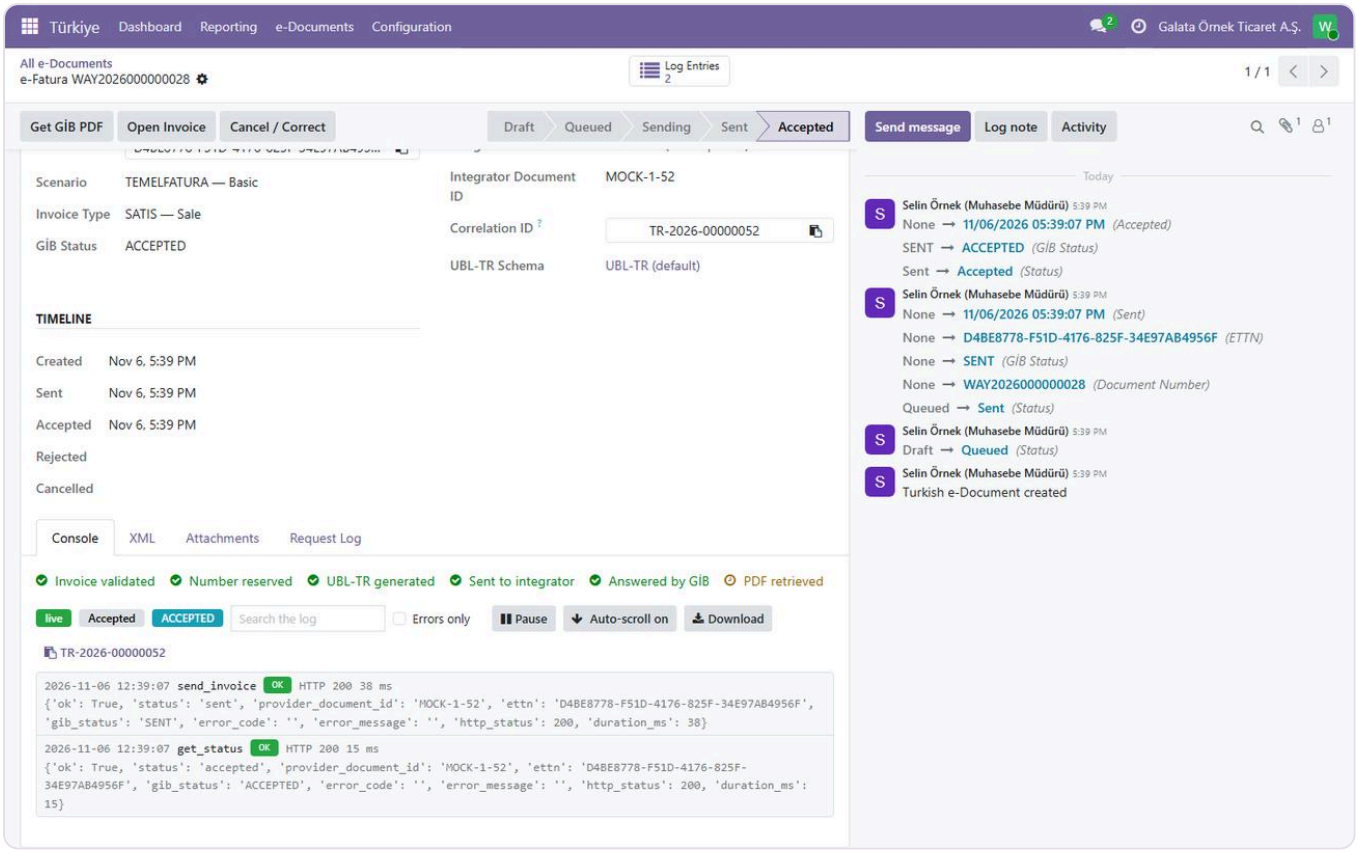

INV/2026/00045 to Karadeniz Makine is posted but its e-Arşiv document is still Draft, because the demo company has Send Automatically off. Press **Send**. The document is queued at once and the background job does the rest, so nobody waits on the integrator.

Two people pressing Send at the same moment still produce one transmission: the send takes a row lock and uses an idempotency key.

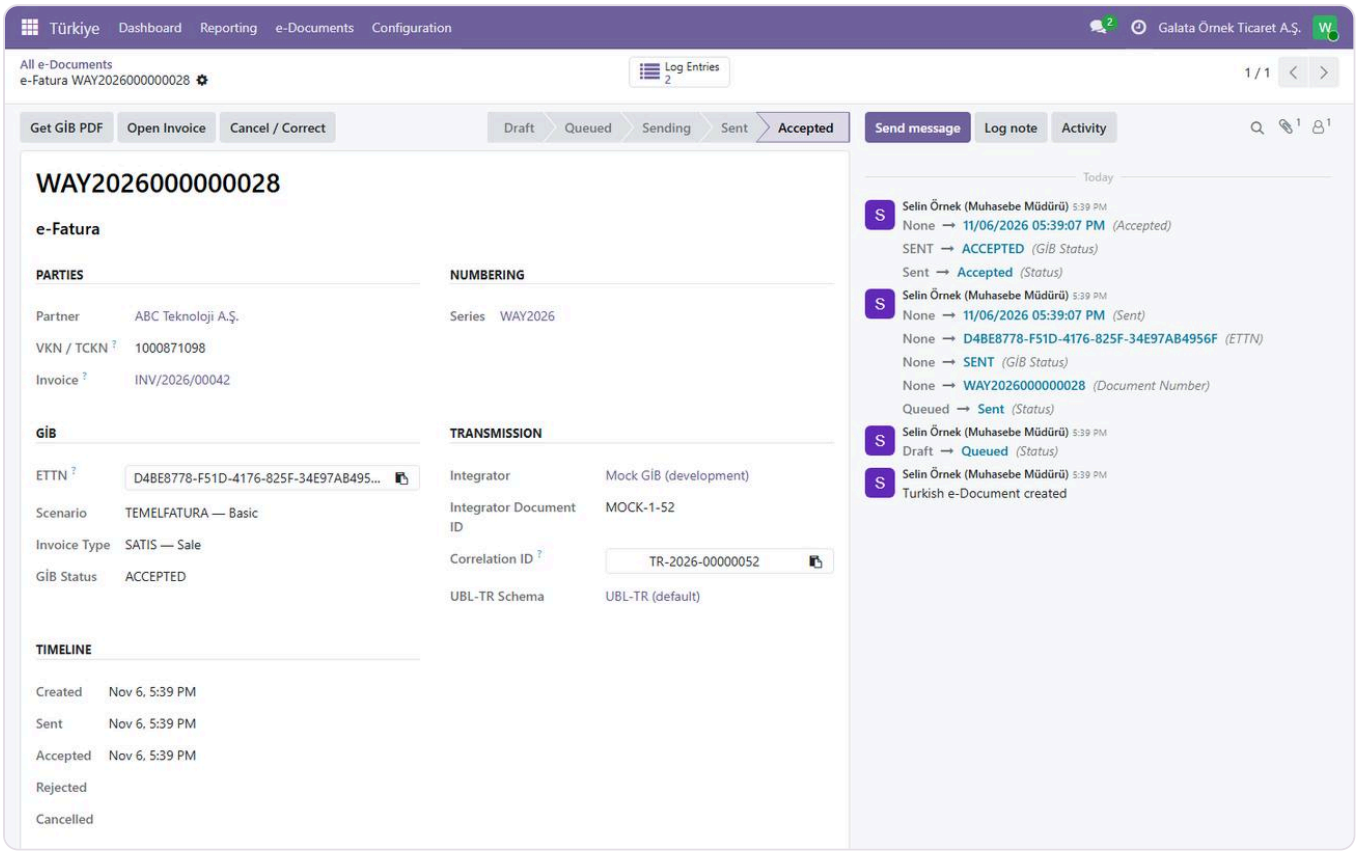

5 The console

The **Console** tab shows the pipeline as it moves: invoice validated, number reserved, UBL-TR generated, sent to the integrator, answered by GİB, PDF retrieved, with the request log underneath: search it, show errors only, pause, turn auto-scroll on or off, or download it. It stops polling once the document settles.

6 The accepted document

Parties: company and partner with their identities. **GİB**: document type, scenario, invoice type, ETTN, GİB status. **Transmission**: integrator, integrator id, attempts. **Timeline**: created, sent, accepted. The integrator document id, the correlation id that ties every log line together and the UBL-TR schema used. Buttons: **Get GİB PDF**, **Open Invoice**, **Cancel / Correct** and **Log Entries**; **Send**, **Refresh Status** and **Retry** appear in the states where they apply.

7 The UBL-TR

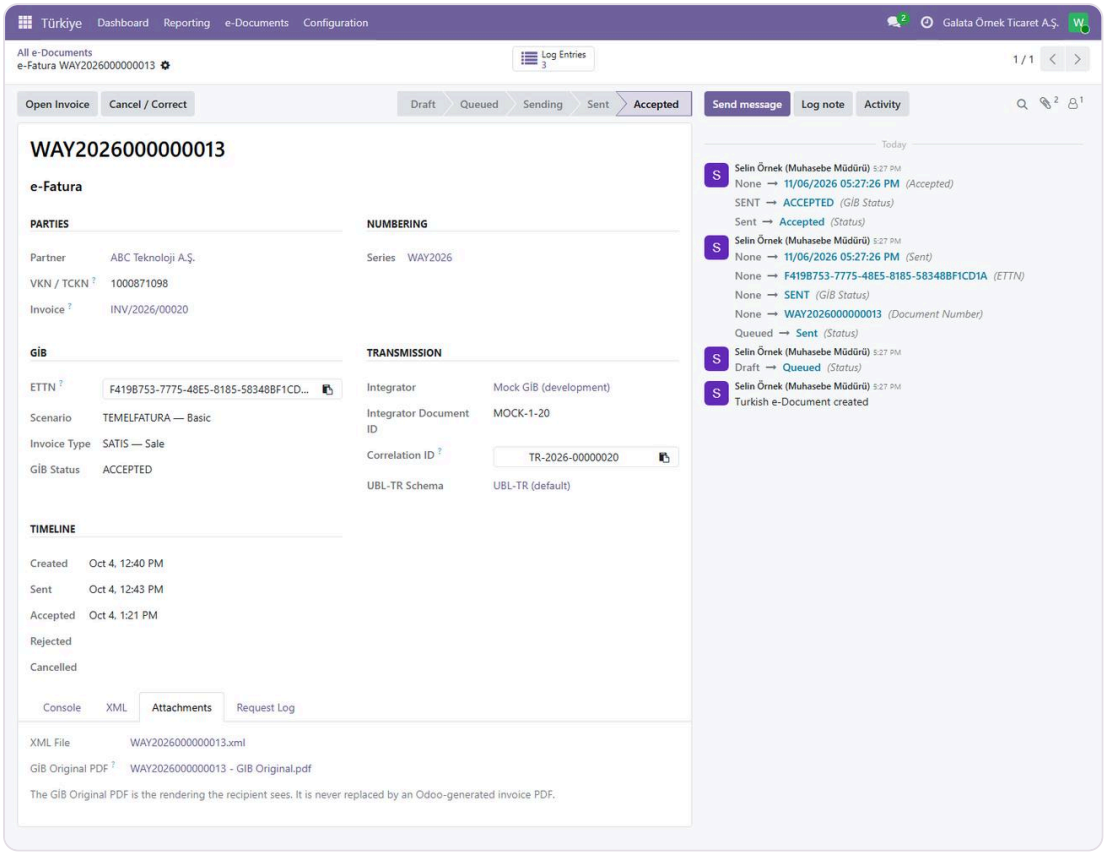

The **XML** tab holds the document that was built: Odoo's own UBL 2.1 builder with the Turkish parts added (profile, scenario, invoice type, ETTN, party identification by VKN or TCKN). Before it leaves, the validator checks required elements, both parties, scenario against type, the ETTN, totals, lines and units, and reports every problem at once. The invoice XML is shown on one unbroken line; download it from Attachments to read it formatted.

8 The tevkifat split in the XML

On a TEVKIFAT invoice the withholding goes into the UBL and the split is written into the note, so the buyer sees the same figures you do.

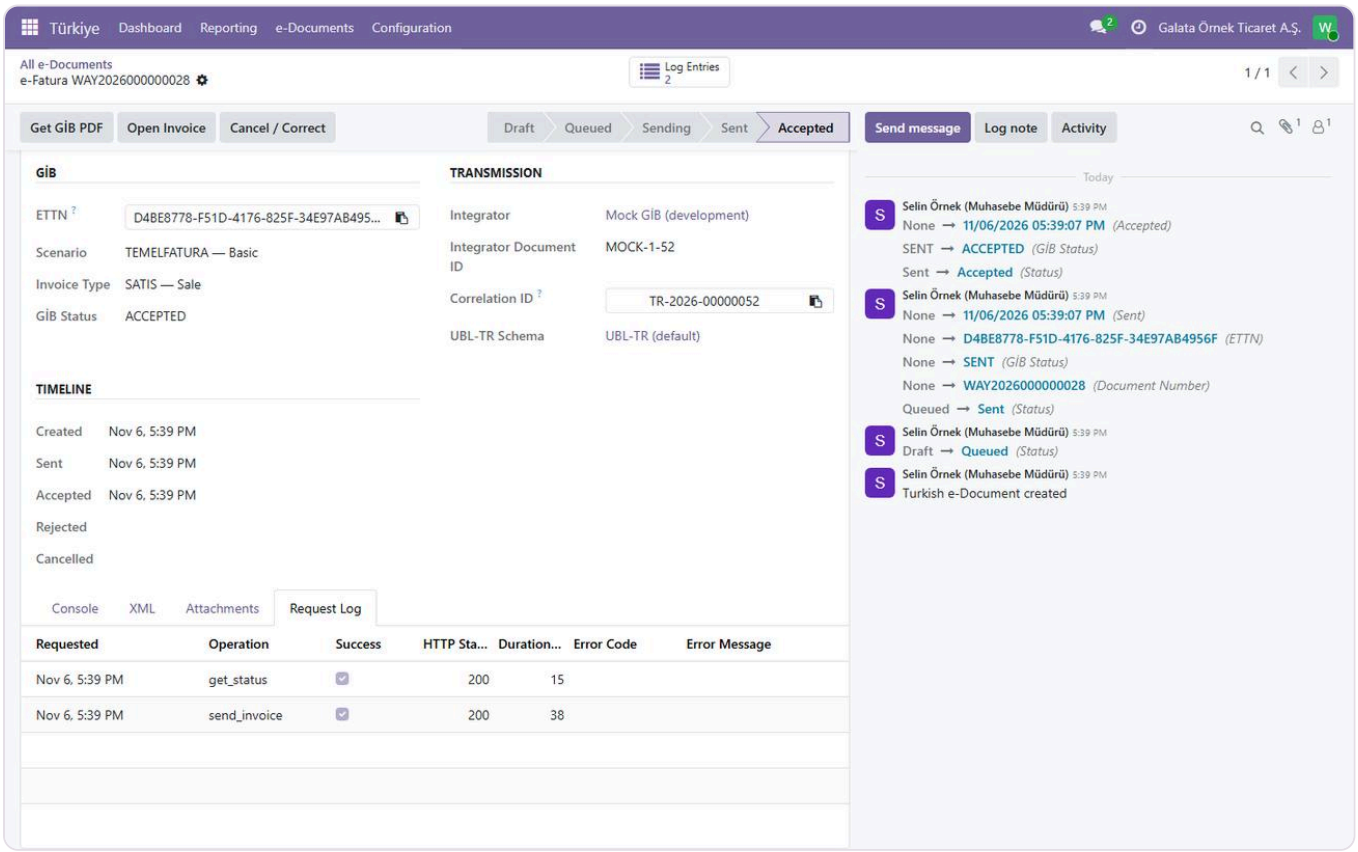

9 Attachments

The XML and the **GİB Original PDF**. On the demo the PDF is the mock's one-page rendering, marked MOCK GIB RENDERING.

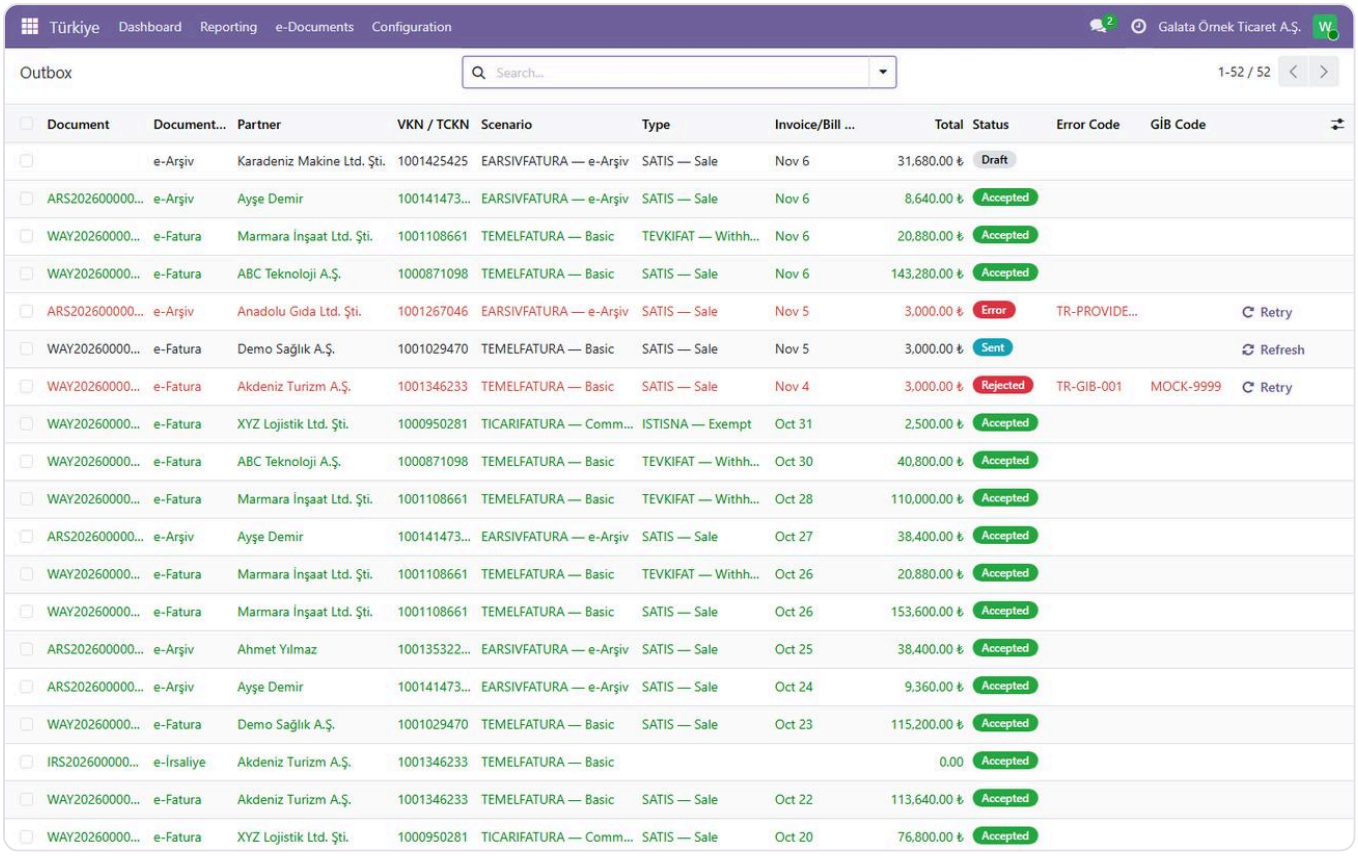

10 Request Log

Every call to the integrator: operation, status, HTTP code, duration, and the request and response, with secrets kept out.

11 e-Documents, Outbox

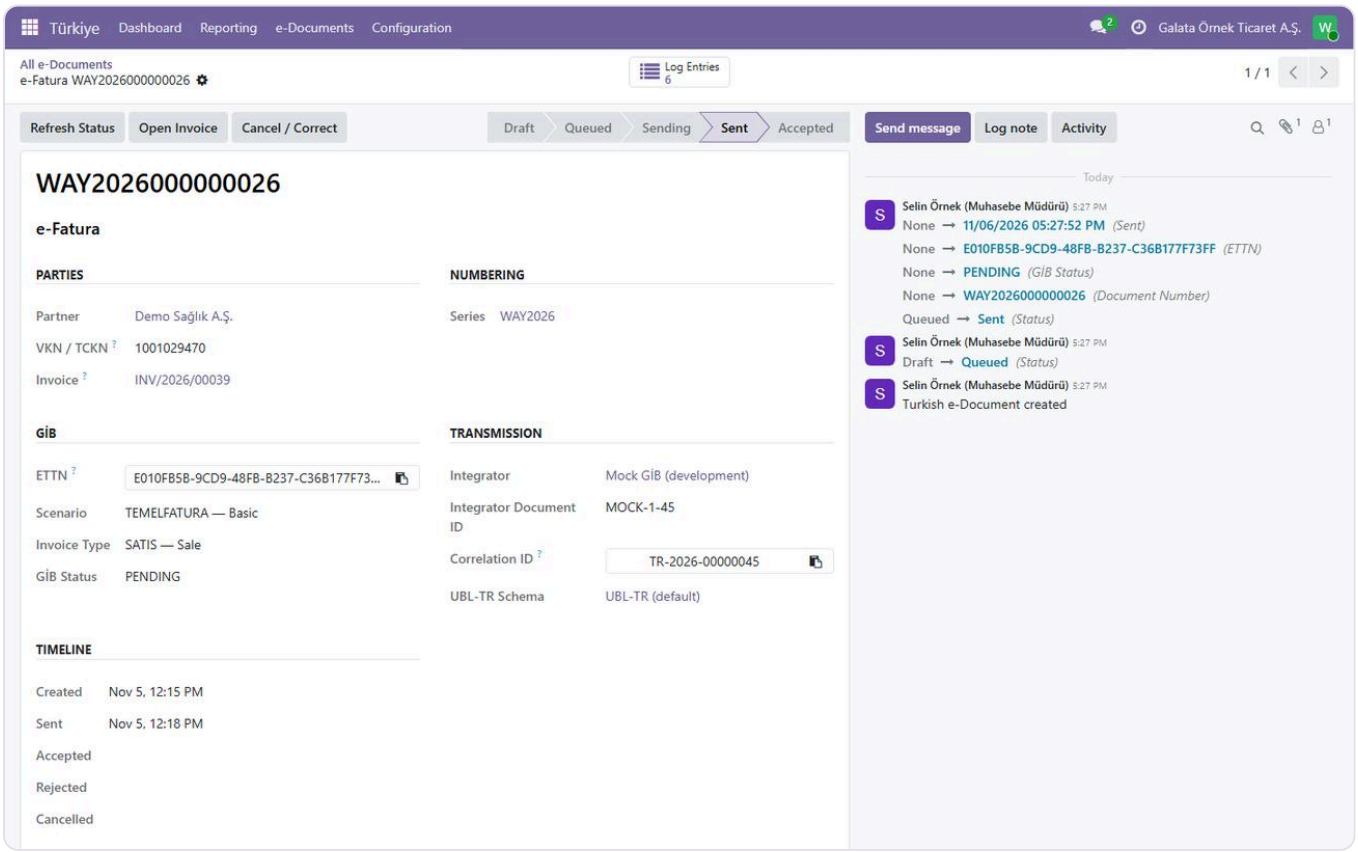

Outgoing documents that have not settled yet; **All Documents** has everything, with filters for each state, Needs Attention, Outgoing, Incoming and Today, and grouping by status, type, partner, scenario, error code and day.

Document	Document...	Partner	VKN / TCKN	Scenario	Type	Invoice/Bill ...	Total	Status	Error Code	GİB Code

12 Pending at GİB

WAY2026000000026 was taken by the integrator and GİB has not answered: Sent, GİB status PENDING. The poll job keeps asking. (On the demo its invoice note carries the MOCK_PENDING marker so it stays this way.)

PART 10 Errors, rejections and cancellation

NEEDS: E-FATURA

An e-invoice that does not go through has to say why, in words an accountant can act on. The error queue shows the GİB code, the reason as GİB gave it, and a suggested fix.

IN THIS PART YOU WILL LEARN

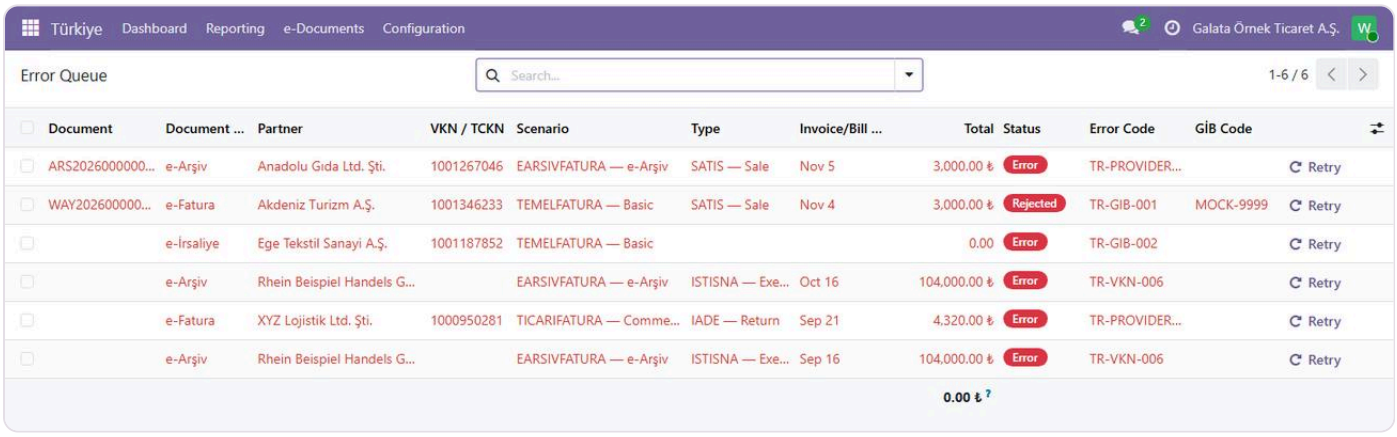

- The error queue, and the difference between an error and a rejection
- Retrying a technical failure, fixing a rejection
- Which correction route applies, and why there is no single Cancel
- Known limits in this version: credit notes and export invoices

TRY IT YOURSELF ON THE DEMO

1. e-Documents, Error Queue
2. Open the rejected WAY2026000000027 and read the Error tab
3. Open an accepted document and press Cancel / Correct, then Close

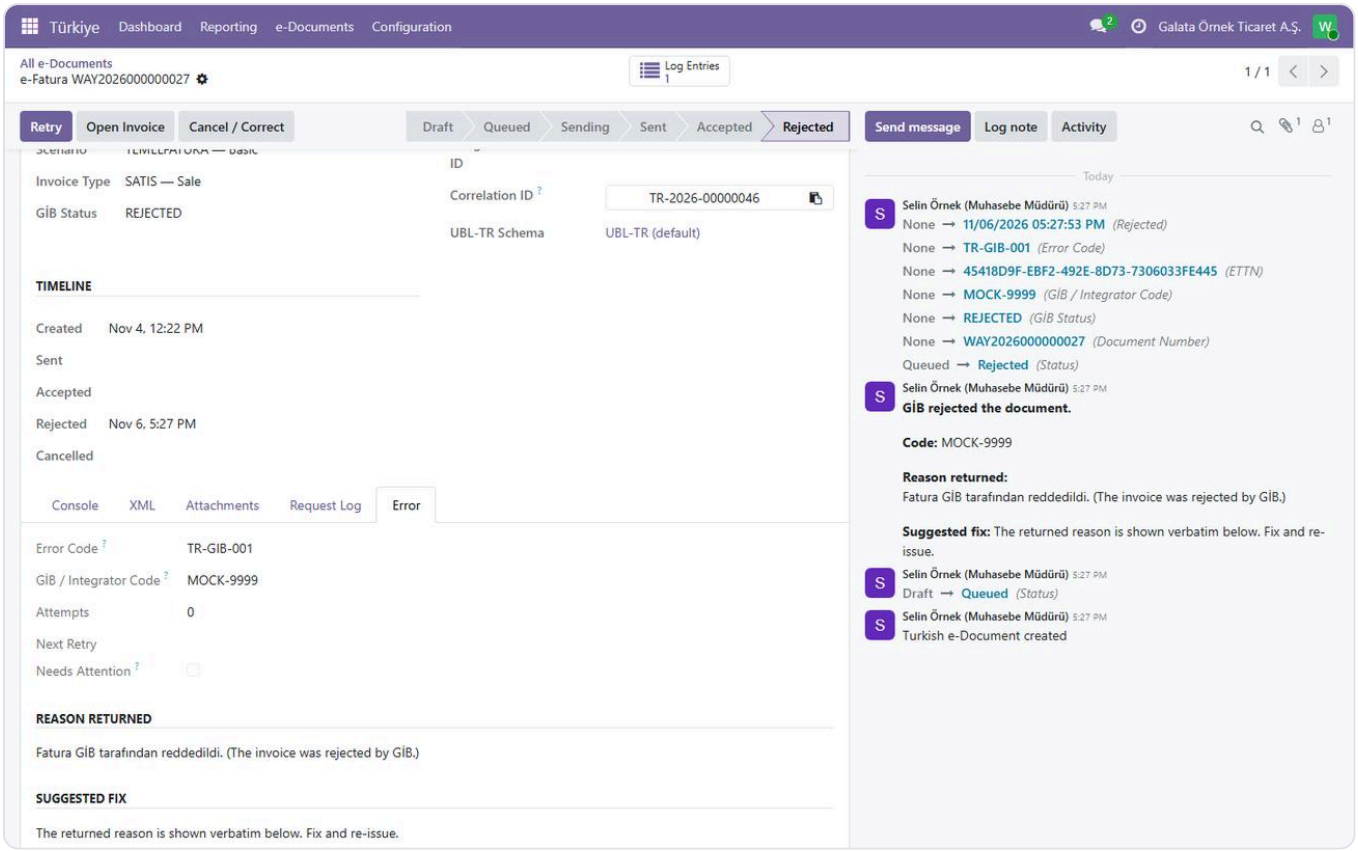

1 e-Documents, Error Queue

Rejected and failed documents with partner, VKN or TCKN, scenario, type, total, the suite's error code and the GİB code, and a **Retry** button on each row.

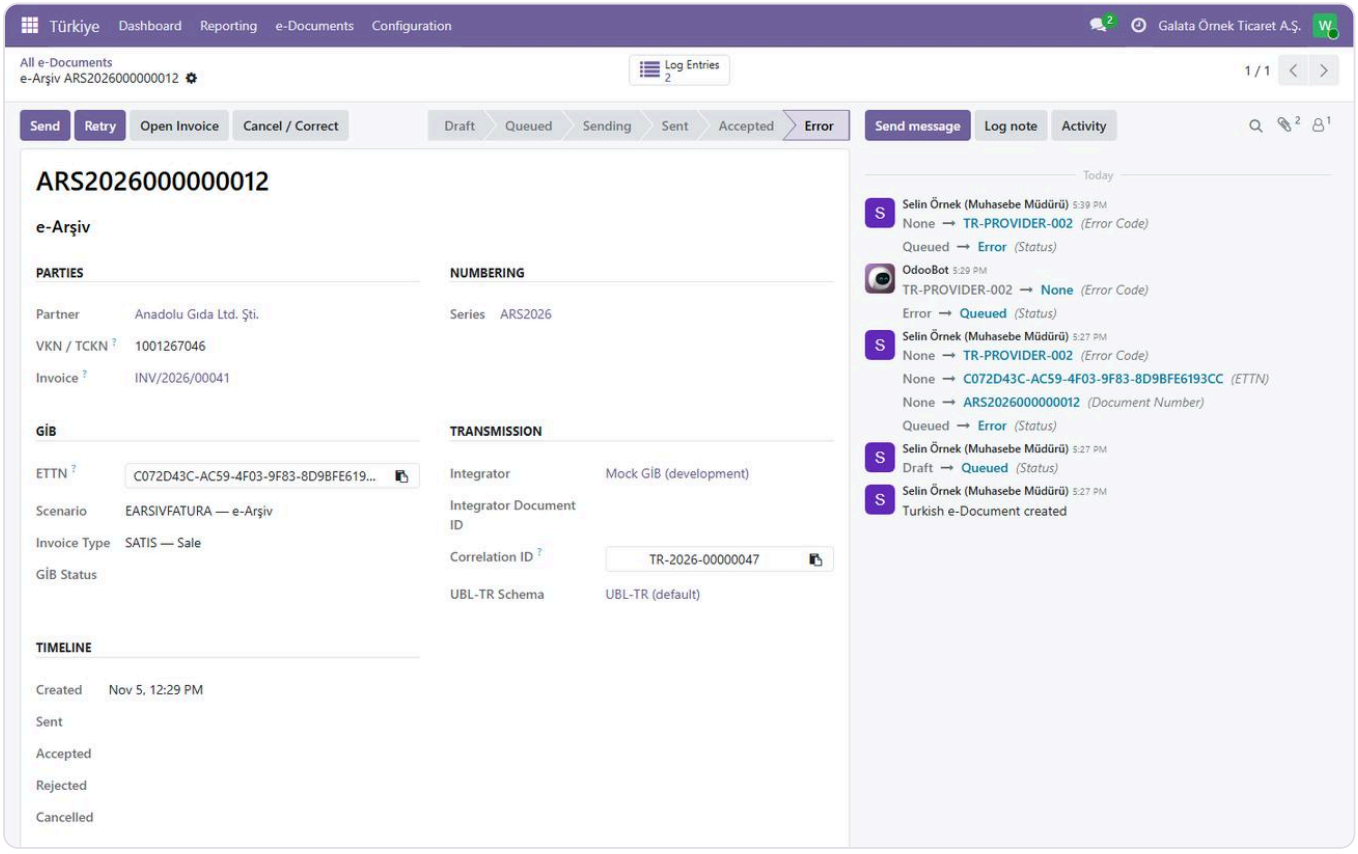

2 A rejection

WAY2026000000027 to Akdeniz Turizm: GİB said no (MOCK-9999 on the demo). The **Error** tab shows the code, the reason returned in Turkish with the English beside it, and the suggested fix. A rejection is final for that document: fix the cause on the invoice and issue a new one.

3 A technical failure

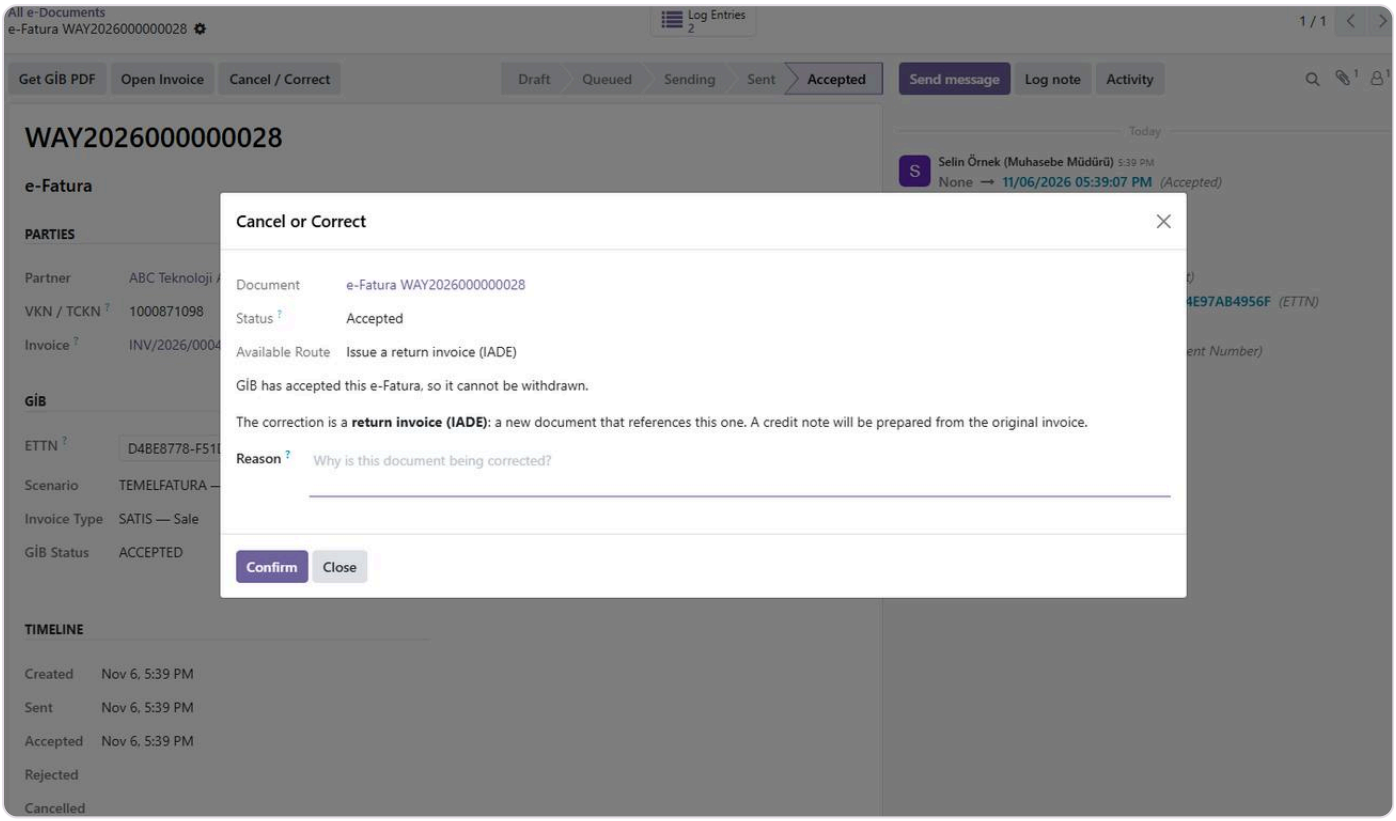

The e-Arşiv for Anadolu Gıda timed out at the integrator (MOCK_TIMEOUT on the demo). It is retried on its own with a growing wait. You can press **Retry** to try now.

4 Cancel / Correct

There is no single cancel, because what is legally possible depends on how far the document got. The wizard works out the one route that applies and says why: **Abandon** for a document that never reached the integrator or was rejected; **Request cancellation** for an e-Arşiv, or an e-Fatura sent but not yet answered; **Issue a return invoice (IADE)** for an accepted e-Fatura, which opens Odoo's credit note wizard. A reason is required and every route is recorded.

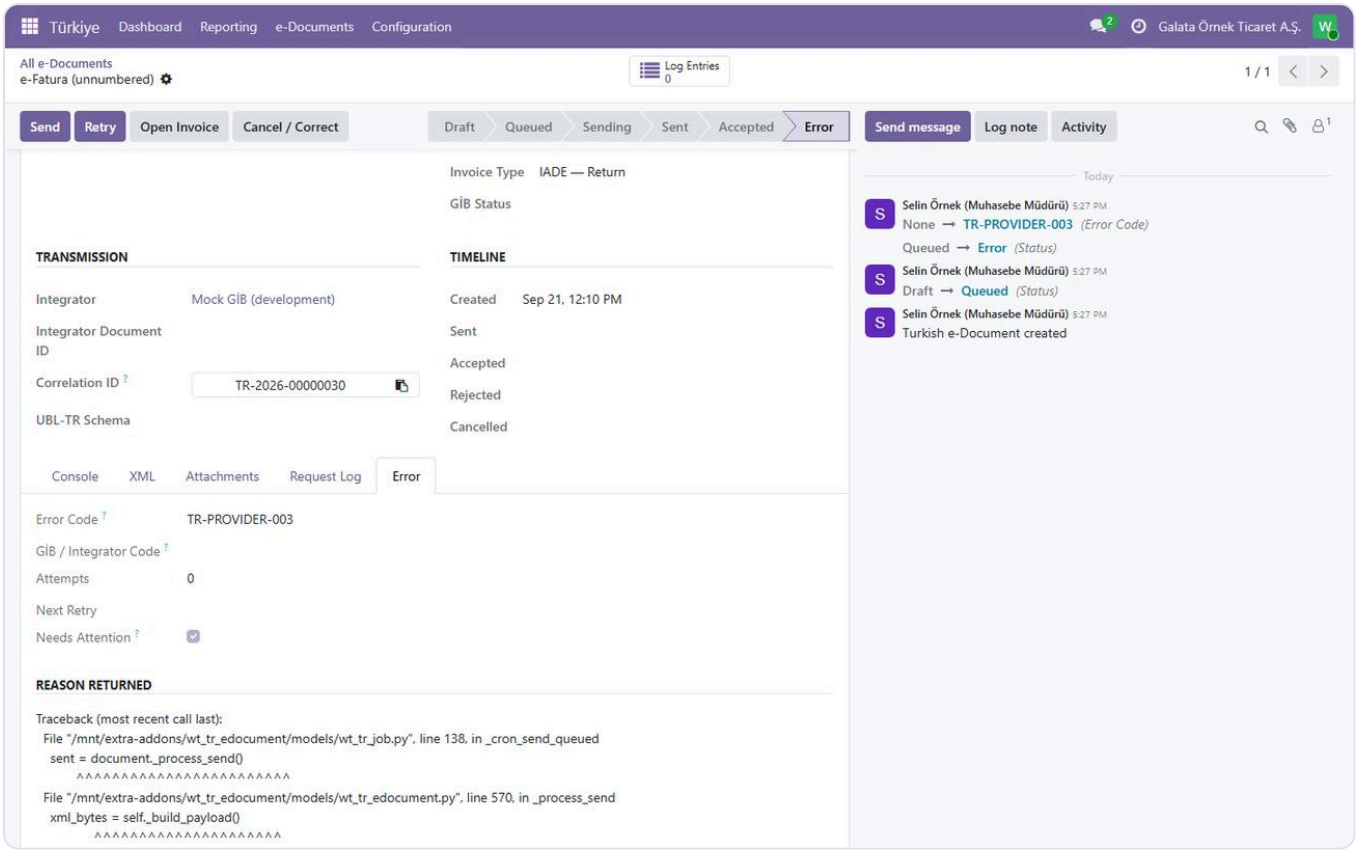

The window in which an e-Arşiv may be cancelled is a legal parameter; the wizard says to confirm it with your mali müşavir.

Known limits in this version

5 Credit notes do not build

The September return to XYZ Lojistik (RINV/2026/00001) posts normally in accounting, but its e-document fails when the UBL is built (TR-PROVIDER-003) and, after its retries, waits for attention. In this version a credit note cannot be sent as an e-document. This is the same path the Cancel / Correct wizard uses for an accepted e-Fatura.

6 Export invoices cannot be sent

Both invoices to Rhein Beispiel Handels GmbH are routed to e-Arşiv (no customs VKN on the company) and then refused with TR-VKN-006: the engine requires a Turkish VKN or TCKN on every recipient, which a foreign buyer does not have. Setting the customs VKN changes the routing but not this check, so export invoicing needs a fix in the module before it can be used.

PART 11 Incoming invoices: inbox, matching and answers

NEEDS: E-FATURA

Suppliers' e-invoices arrive through the integrator. The suite matches each one to a supplier, makes a draft vendor bill with the XML attached, and never posts it by itself.

IN THIS PART YOU WILL LEARN

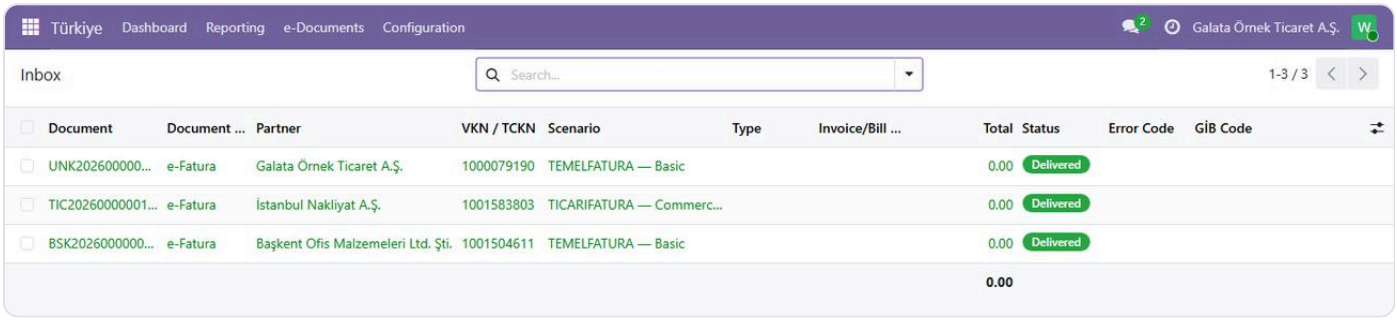

- How a supplier is matched, in order of confidence
- The draft vendor bill
- Accepting or rejecting a TICARIFATURA invoice
- The review queue for senders nobody knows

TRY IT YOURSELF ON THE DEMO

1. e-Documents, Inbox: open TIC2026000000107 (İstanbul Nakliyat)
2. e-Documents, Review Queue
3. Vendors, Bills: the two drafts made from incoming invoices

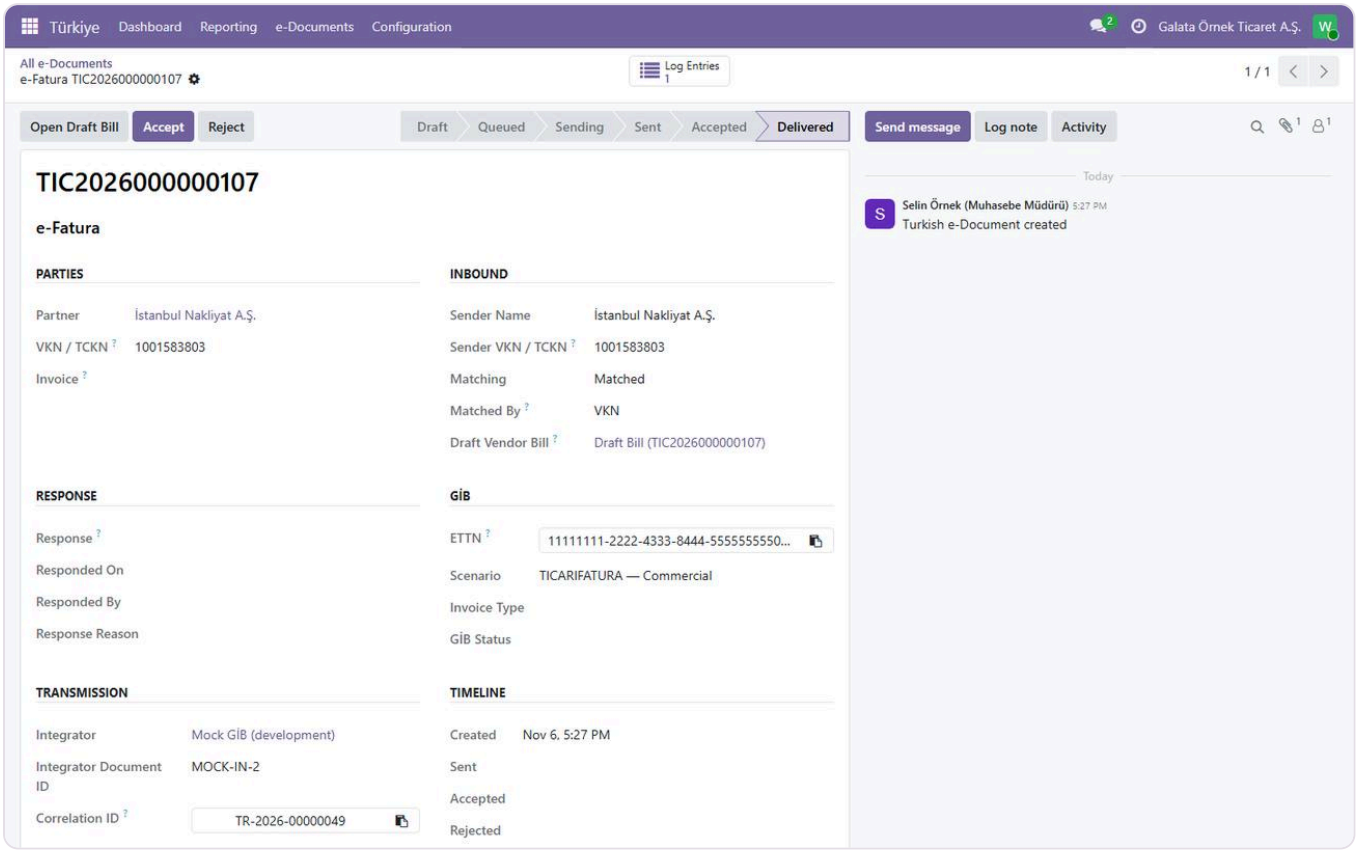

1 e-Documents, Inbox

Every incoming invoice with sender, VKN, scenario, total and match status. The fetch job runs every 30 minutes.

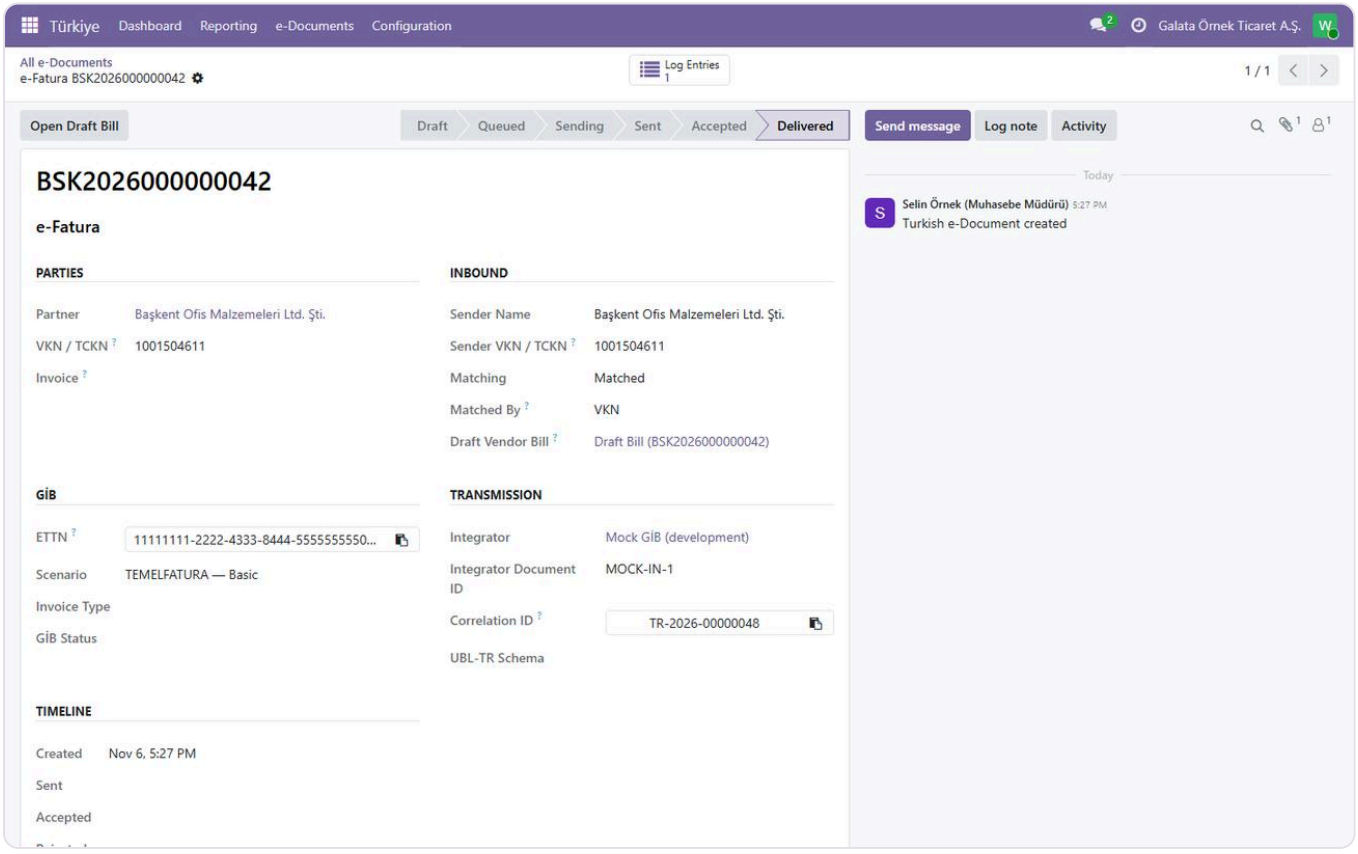

2 A commercial invoice waiting for you

TIC2026000000107 is TICARIFATURA, so the sender expects an answer. **Accept** or **Reject** sends it through the integrator and records it; a basic invoice cannot be answered, and an answered one cannot be answered twice. **Open Draft Bill** goes to the bill.

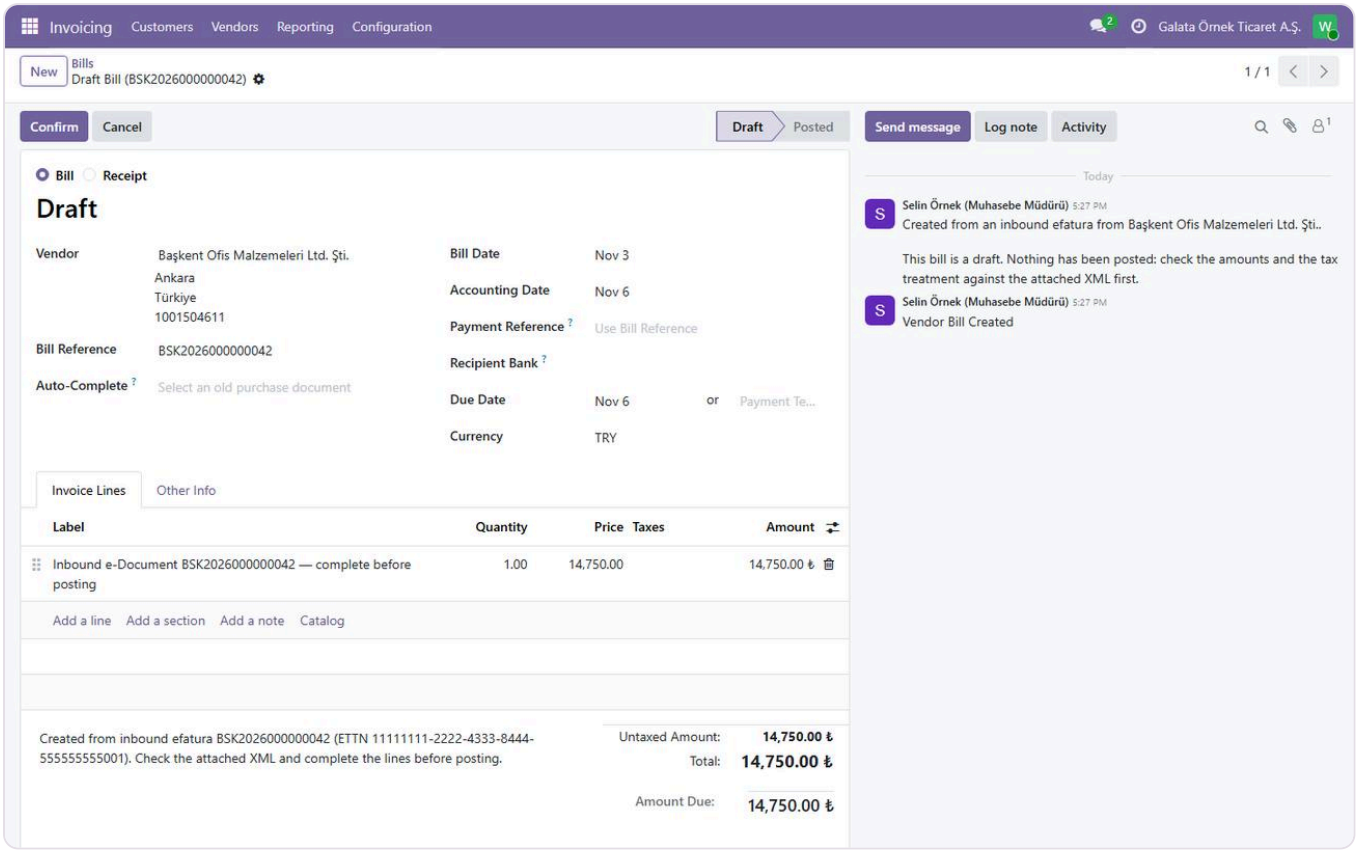

3 Matched

BSK2026000000042 from Başkent Ofis was matched by VKN. The supplier is found by the VKN field first, then TCKN, then the plain Tax ID field, then the Tax ID with a TR prefix, and the record says which rule matched.

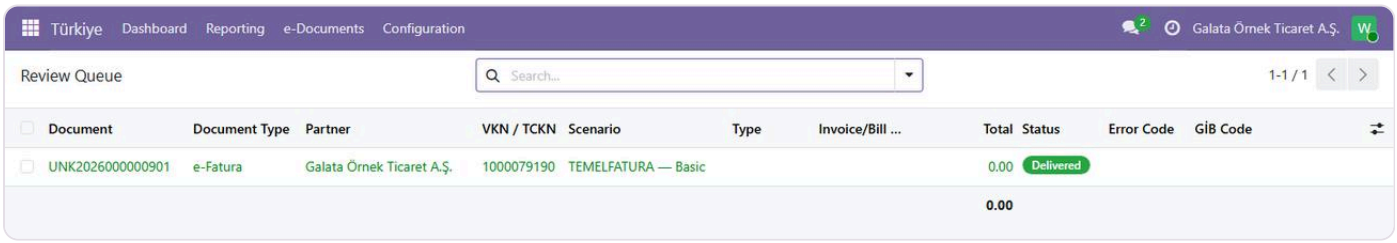

4 The draft bill

A draft vendor bill with the supplier, date, reference and amount, and the XML attached. Check it and post it yourself.

5 e-Documents, Review Queue

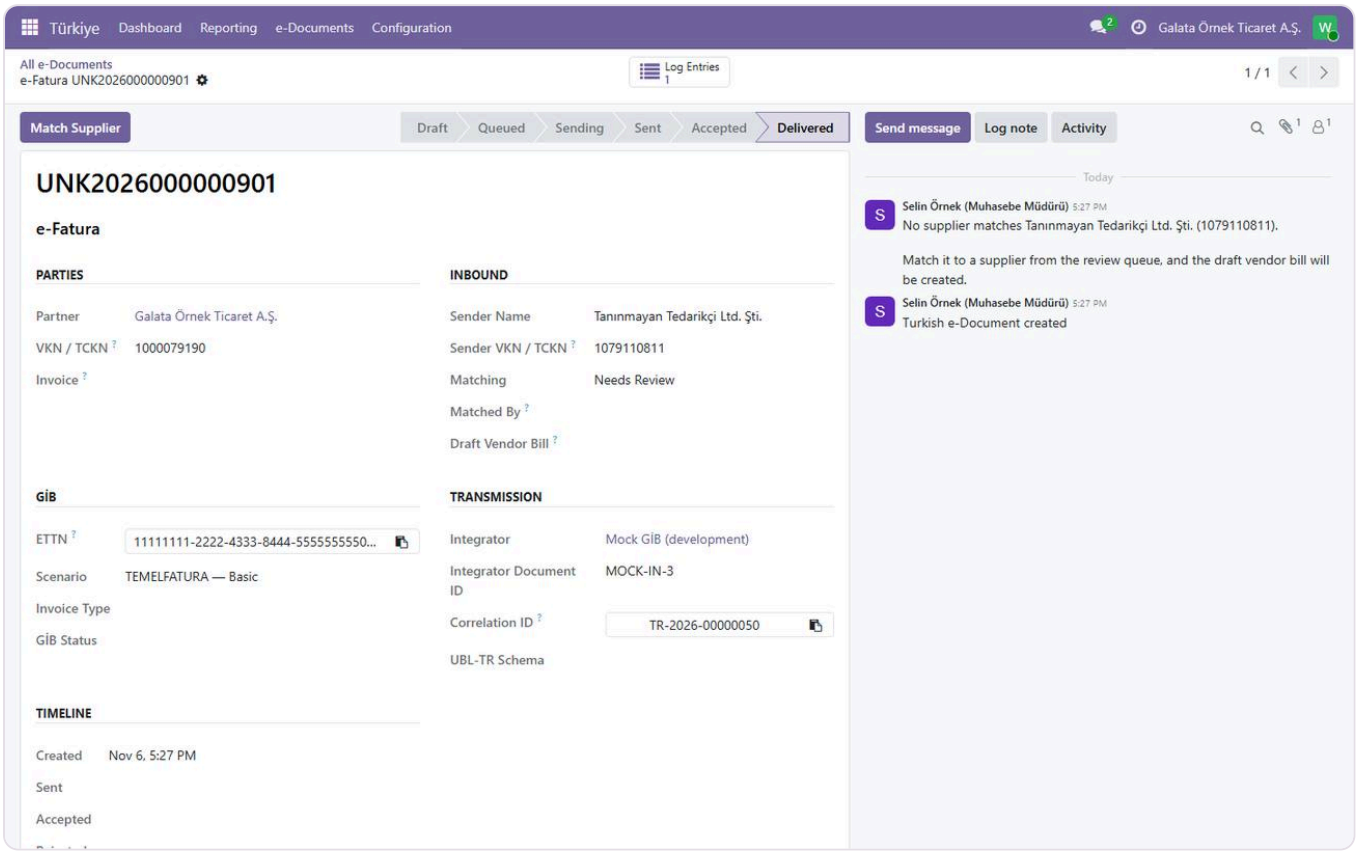

Incoming documents with no supplier match. UNK2026000000901 comes from a VKN nobody has.

6 Fixing a match

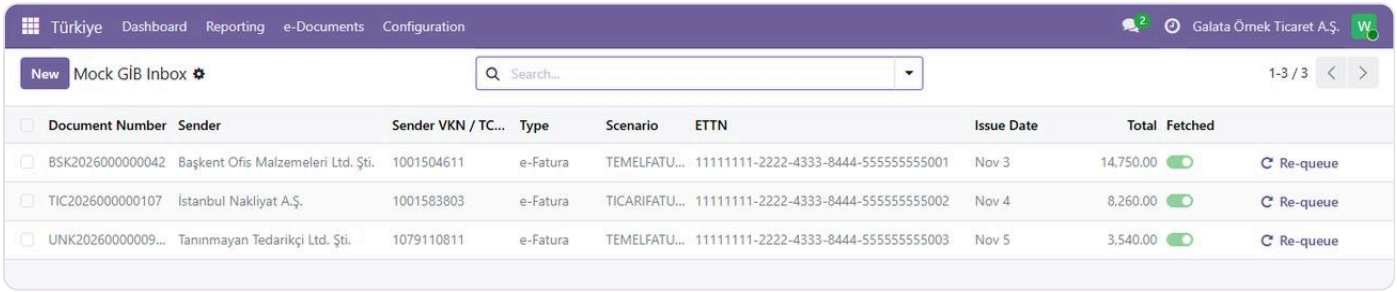

Create or correct the supplier's VKN, then press **Match Supplier** to run matching again. Creating unknown suppliers automatically is a company setting, off by default, and the suite advises keeping it off.

On the demo the unmatched document shows the demo company itself in the partner field until it is matched.

7 Mock GİB Inbox

On a test company, Configuration, e-Documents, Mock GİB Inbox holds the invoices the mock integrator will deliver. **Re-queue** sends one again, which is how the inbox is demonstrated without a real supplier.

PART 12 Numbering, the GİB user list and the e-Arşiv daily report

NEEDS: E-FATURA

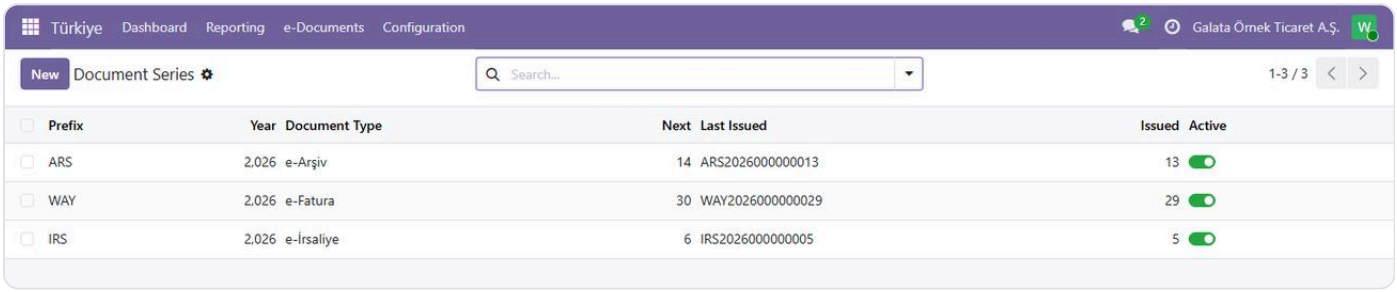

Three things run quietly behind every e-invoice: the number series, the cache of who is registered, and the daily report of e-Arşiv invoices. Each has its own screen.

IN THIS PART YOU WILL LEARN

- The sixteen-character number and its series
- Check for Gaps, Close Series and Open Next Year
- The GİB user list, live lookups and staleness
- The e-Arşiv daily report

1 Document Series

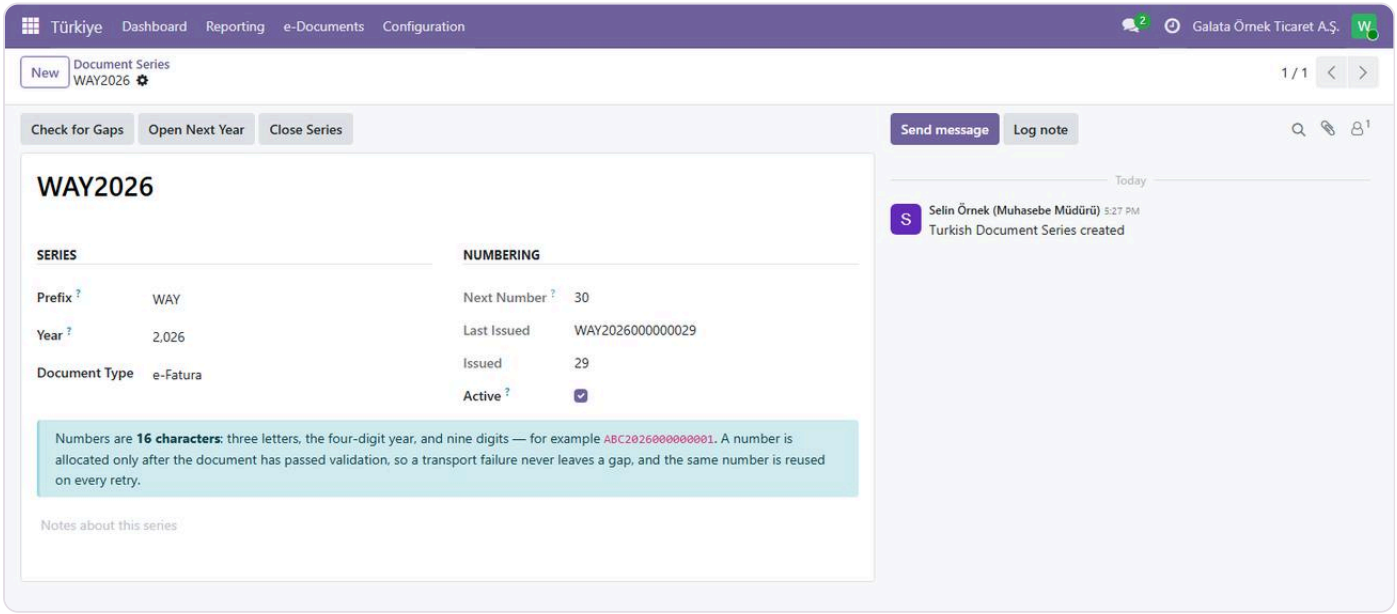

Configuration, e-Documents, Document Series (Turkish System Administrator). One series per document type per year: WAY for e-Fatura, ARS for e-Arşiv, IRS for e-İrsaliye on the demo. A number is the three-letter prefix, the four-digit year and nine digits: **WAY2026000000001**.

2 A series

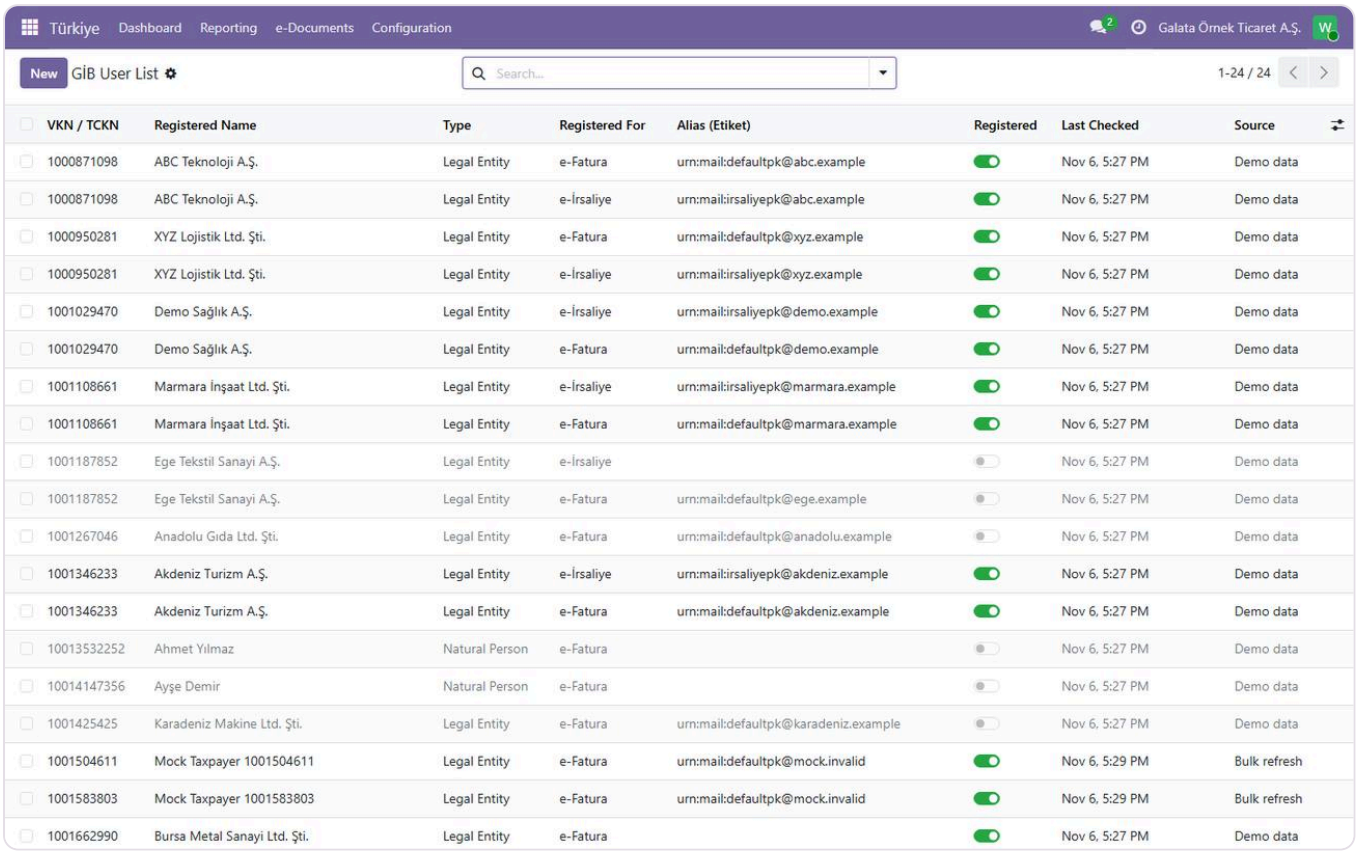

Prefix (three letters, no digits), year, type, next number, last allocated and count. **Check for Gaps** lists numbers issued that no live document holds, so each can be explained before an inspector asks. **Open Next Year** creates the same series for next year. **Close Series** stops it issuing.

A number is taken in one database statement, only after validation, and kept on retry, so a timeout never leaves a gap.

3 GİB User List

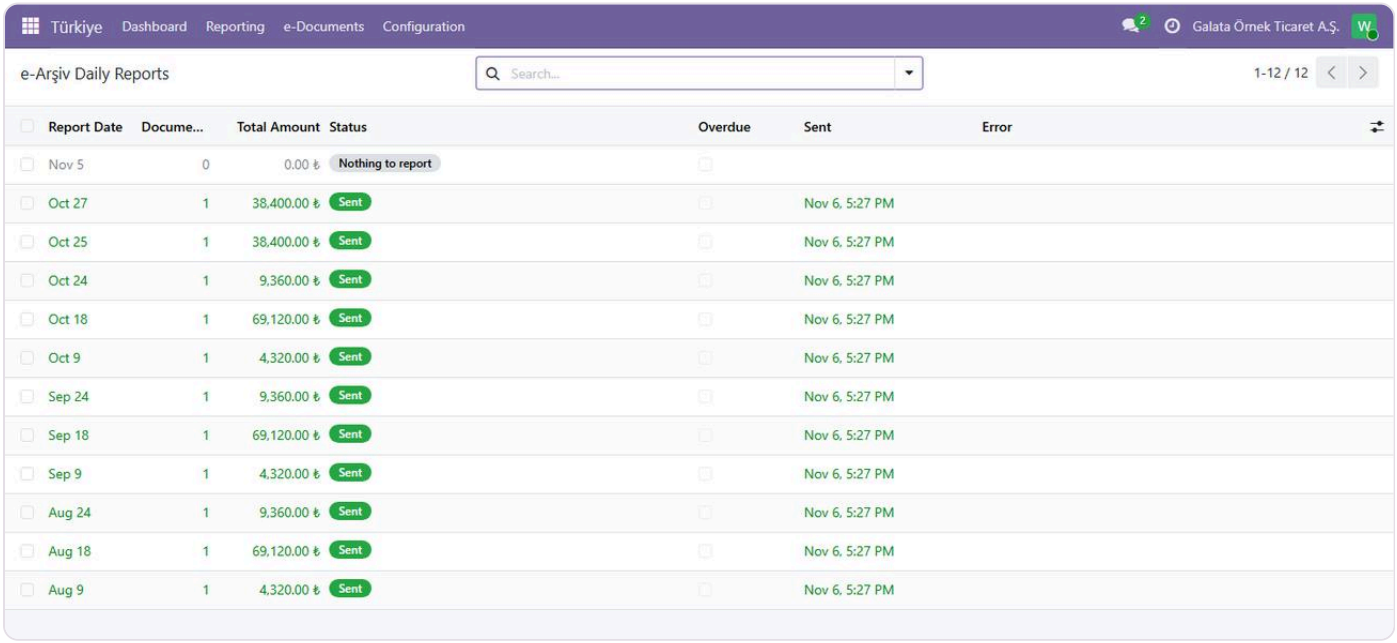

Configuration, e-Documents, GİB User List: identity number, title, alias, document type (e-Fatura and e-İrsaliye are separate entries), registered or not, source and when checked. Refreshed daily from the integrator. A partner missing from the list triggers a live lookup instead of being assumed unregistered, and an entry older than the company's maximum age is flagged.

VKN / TCKN	Registered Name	Type	Registered For	Alias (Etiket)	Registered	Last Checked	Source

5 A report

The documents on the **Documents** tab, the integrator's report id once sent, and the buttons **Send Report** and **Recollect**. A sent report is never rewritten.

PART 13 e-İrsaliye: the electronic delivery note

NEEDS: E-İRSALIYE

An irsaliye travels with the goods. What matters on it is the movement: what left, when, in which vehicle and driven by whom, because that is what a roadside check asks for.

IN THIS PART YOU WILL LEARN

- Switching e-İrsaliye on
- The e-İrsaliye tab on a delivery
- What is checked before a delivery note is issued
- A recipient registered for e-Fatura but not e-İrsaliye

TRY IT YOURSELF ON THE DEMO

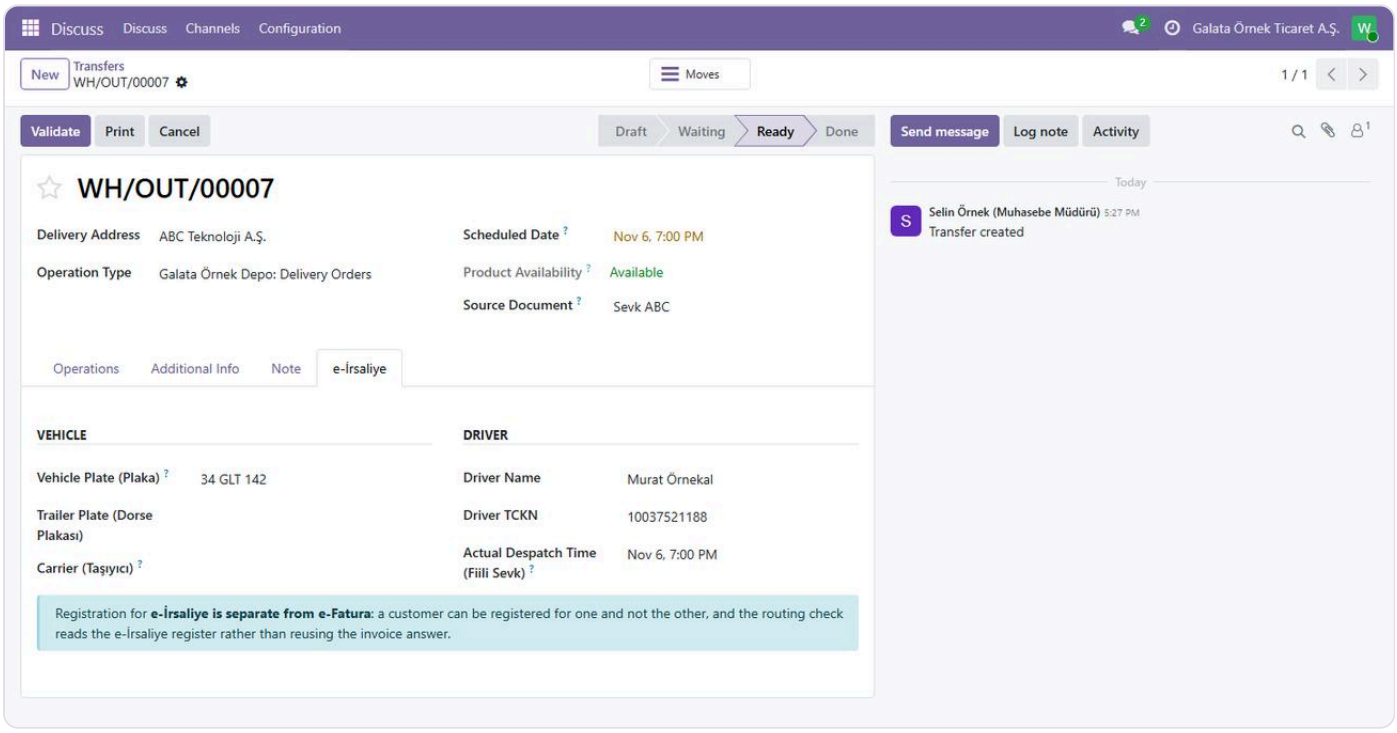

1. Inventory, Transfers: open WH/OUT/00002, e-İrsaliye tab
2. Open WH/OUT/00007, ready to ship today
3. Open WH/OUT/00006 to Ege Tekstil, and its refused document

Turn on **e-İrsaliye Enabled** on the company. From then on, validating an outgoing delivery creates its e-İrsaliye. Like the invoice, a failure never blocks the goods: the delivery still completes and the problem is posted on it.

1 Before it leaves

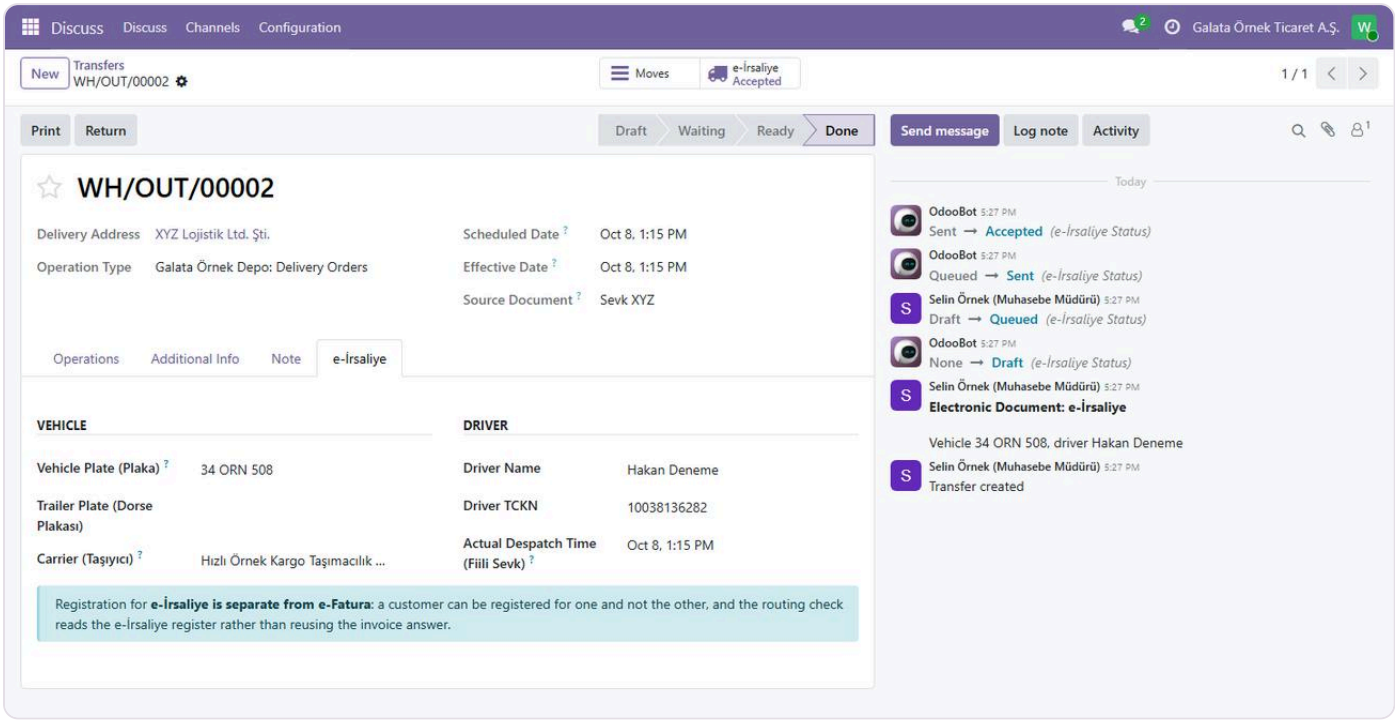

WH/OUT/00007 to ABC Teknoloji, ready. The **e-İrsaliye** tab: **Vehicle Plate** (Plaka), **Trailer Plate** (Dorse), **Driver Name** and **Driver TCKN**, **Carrier** (Taşıyıcı) when a third party carries the goods, and **Actual Despatch Time** (Fiili Sevk), which is not the scheduled date.

Plates are upper-cased and checked against the usual format (34 ABC 123); an unusual plate gets a warning but is accepted. The driver TCKN must pass its checksum.

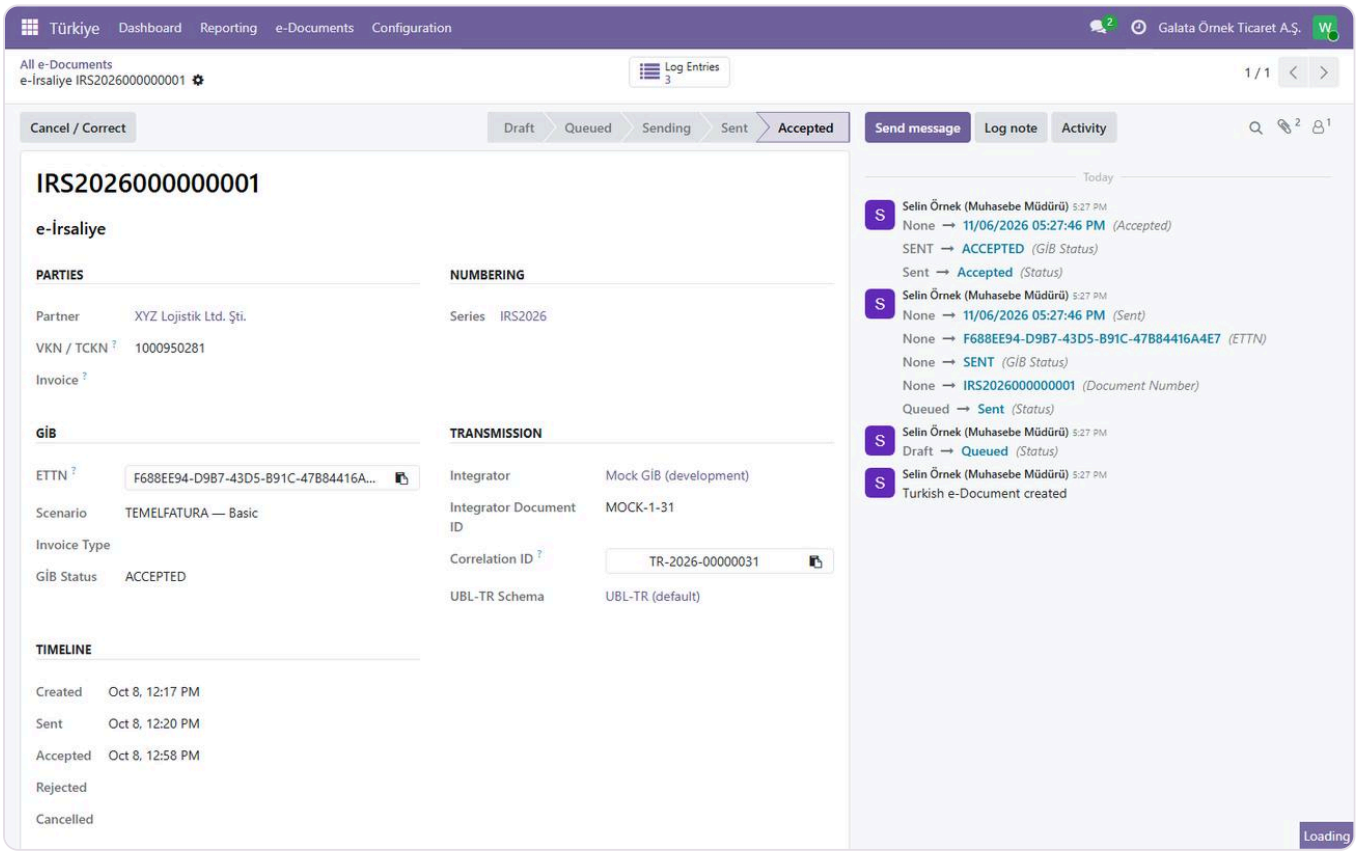

2 Validated and issued

WH/OUT/00002 to XYZ Lojistik, carried by Hızlı Örnek Kargo. Validated, so the e-İrsaliye IRS2026000000001 was issued and accepted. The smart button opens it; **Create e-İrsaliye** exists for the recovery path.

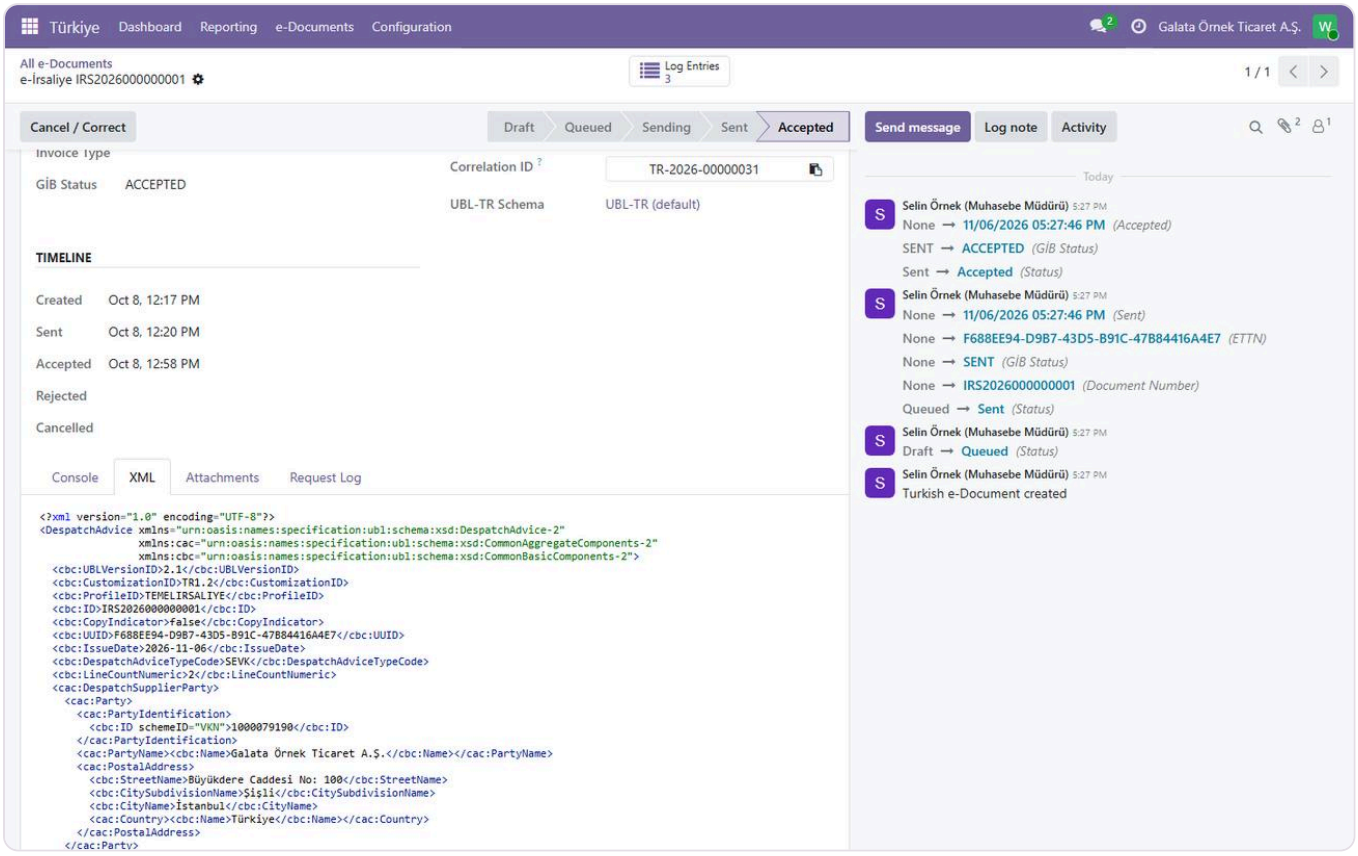

3 The e-İrsaliye document

The same e-document record as an invoice, type e-İrsaliye, with its own series.

4 The despatch advice

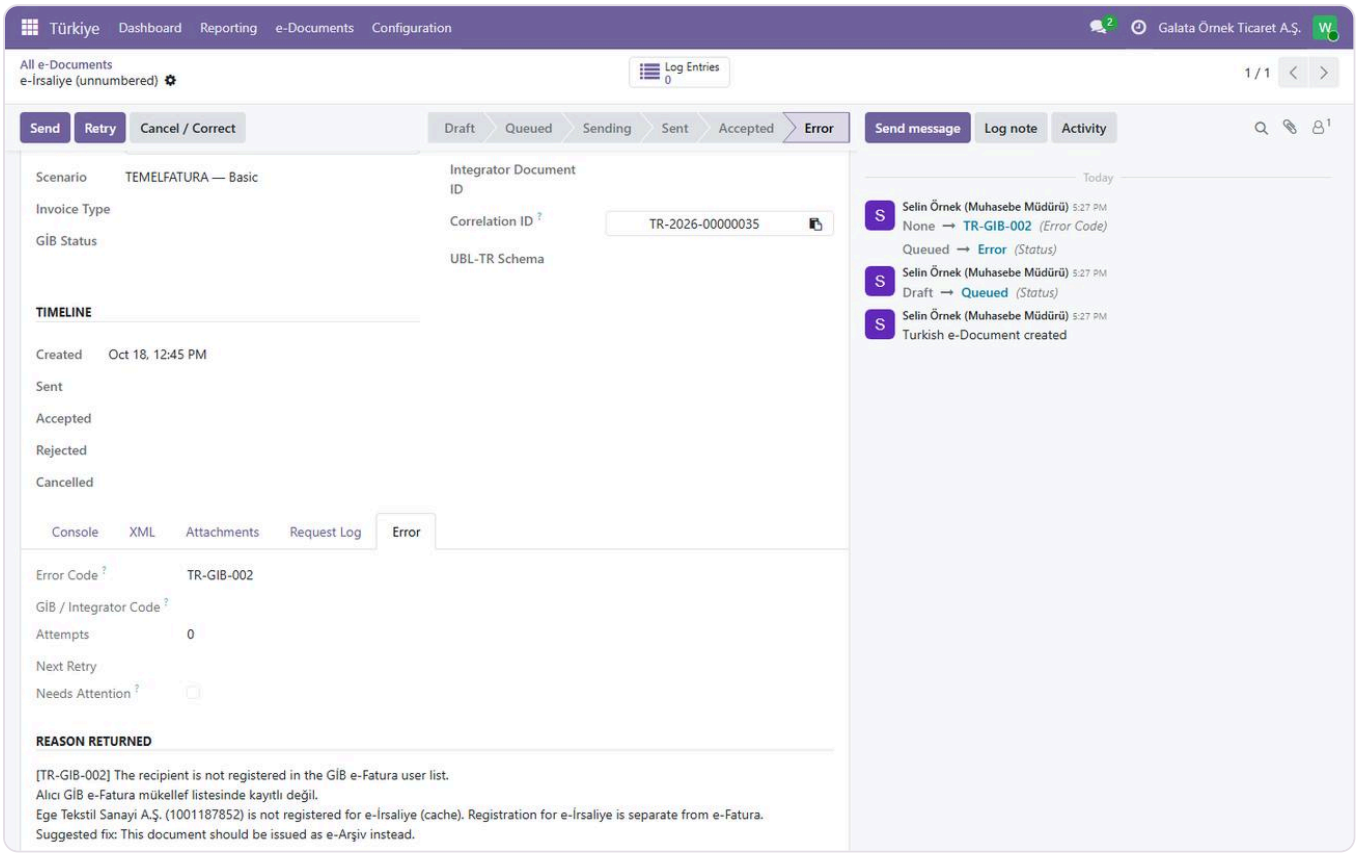

A delivery note is not an invoice: it carries no prices and no tax. The XML is a UBL-TR **DespatchAdvice** with quantities, the shipment, the vehicle and the driver.

5 Not registered for e-İrsaliye

Ege Tekstil is not registered for e-İrsaliye, so the document is refused before it is sent (TR-GIB-002). The goods still left.

The message says "not registered in the GİB e-Fatura user list" although the check it ran was the e-İrsaliye entry; the wording is shared with invoices in this version.

Before an e-İrsaliye is issued the suite checks that there is a vehicle plate, a recipient with a VKN or TCKN, at least one line, and a unit on every line, and lists every problem at once.

PART 14 Mizan, the Turkish trial balance

NEEDS: REPORTS

The Mizan is the first thing a mali müşavir asks for. It is read at a depth of the Tekdüzen chart, usually three digits, with the opening, the period and the closing balance side by side.

IN THIS PART YOU WILL LEARN

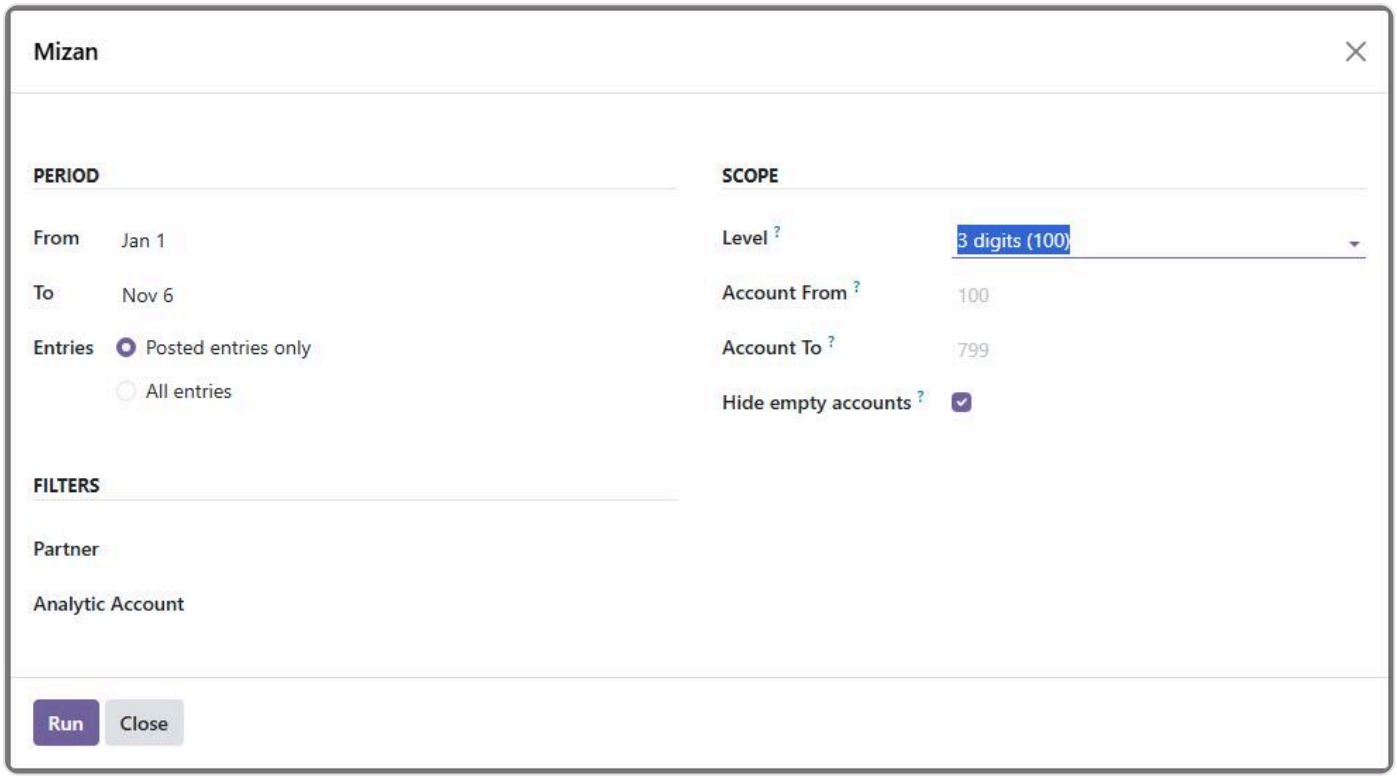

- Running a Mizan for a period
- Levels, account range, partner and analytic filters
- Exporting it to CSV

TRY IT YOURSELF ON THE DEMO

1. Reporting, Mizan: Run with the defaults
2. Change Level to Full account and Run again

1 Reporting, Mizan

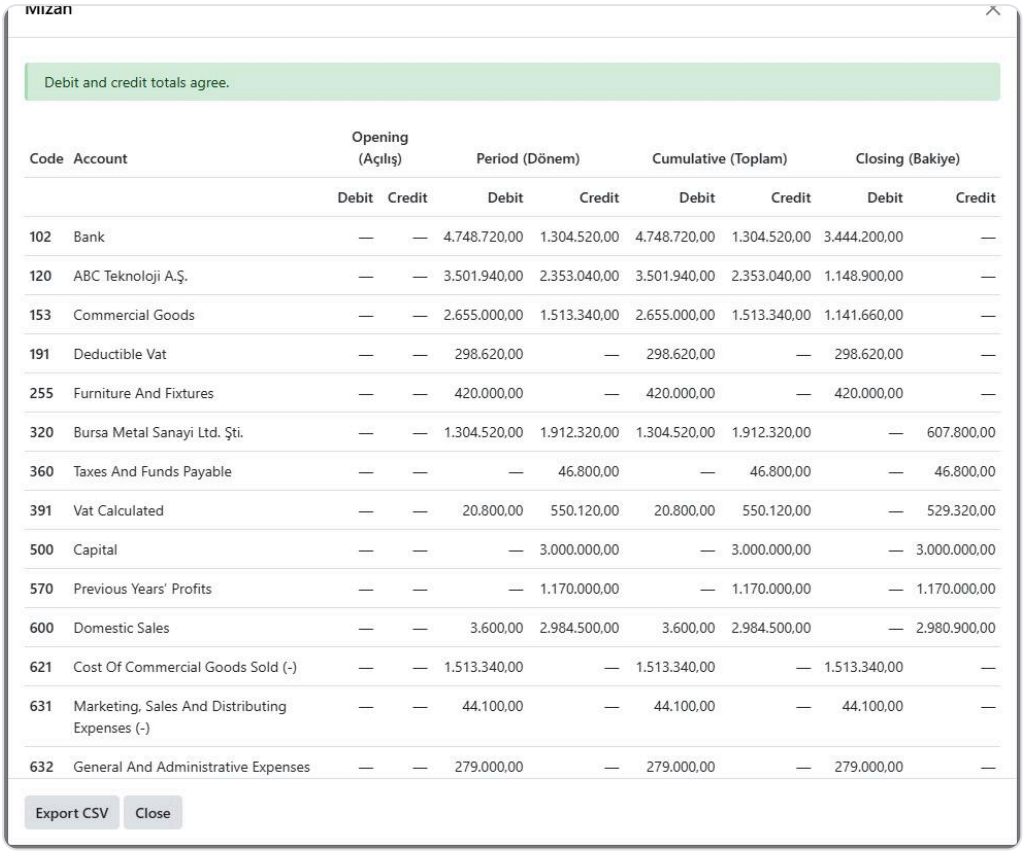

From and **To** (1 January to today by default), **Entries** posted only or all, **Level** (1, 2, 3, 4 or 6 digits, or the full account), **Account From / To** to cut a range such as 100 to 399, **Hide empty accounts**, and filters for one **Partner** or one **Analytic Account**.

2 The result at three digits

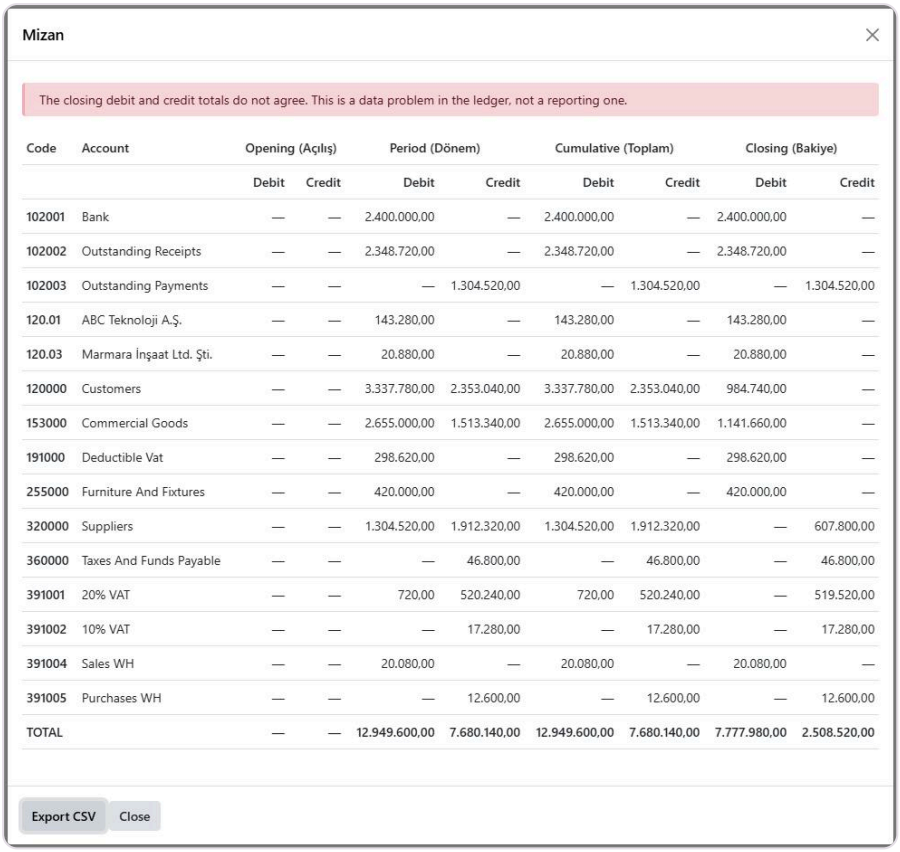

For each account group: opening (Açılış), period (Dönem), cumulative (Toplam) debit and credit, and the closing balance (Bakiye) on its natural side. On the demo: 102 banks, 120 customers, 153 trade goods, 191 deductible KDV, 255 fixtures, 320 suppliers, 360 taxes payable, 391 calculated KDV, 500 capital, 570 prior years' profits, 600 domestic sales, 621 cost of goods sold, and the 7/A accounts 631, 632, 760, 761, 770 and 771. Account names are Odoo's, in English. The report checks that debits equal credits.

At three digits the group label is taken from one account under it. Where partner sub-accounts exist (Part 17) a group such as 120 can show a customer's name as its label; read the code, or use Full account.

3 Full account

Every account on its own line, with Odoo's account names. **Export CSV** downloads the same figures.

Code	Account	Opening (Açılış)		Period (Dönem)		Cumulative (Toplam)		Closing (Bakiye)	
		Debit	Credit	Debit	Credit	Debit	Credit	Debit	Credit

PART 15 Bilanço and Gelir Tablosu

NEEDS: REPORTS

The structure of a Turkish financial statement is fixed by the Tekdüzen code ranges, so the suite encodes the layout and sums your accounts into it by prefix. Hover any line to see the ranges it sums.

IN THIS PART YOU WILL LEARN

- The Bilanço: Aktif against Pasif
- Why it may not balance before the period is closed
- The Gelir Tablosu, from gross sales to net profit

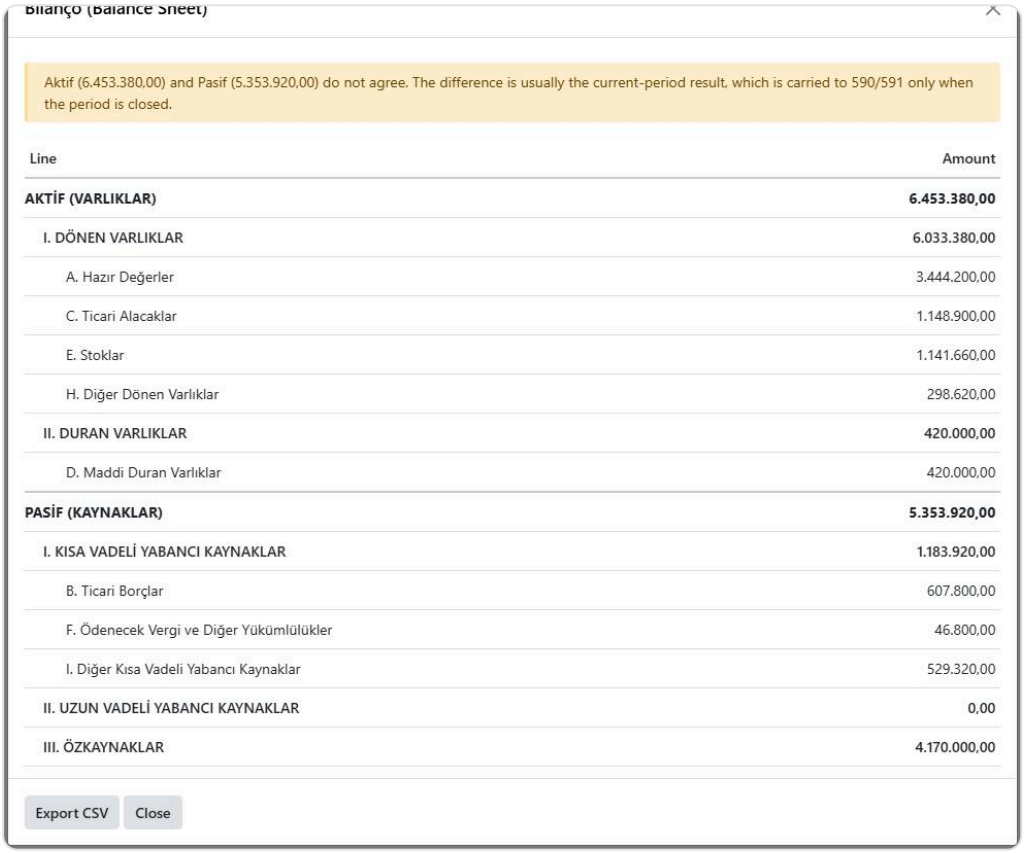

TRY IT YOURSELF ON THE DEMO

1. Reporting, Bilanço / Gelir Tablosu: Run the Bilanço
2. Choose Gelir Tablosu, 1 August to 31 October, Run

1 Bilanço

Cumulative to the To date. Aktif: I. Dönen Varlıklar (cash and banks, receivables, stock, other current assets) and II. Duran Varlıklar (fixed assets). Pasif: short-term and long-term liabilities and Özkaynaklar (equity). Sub-accounts such as 120.01 are picked up because matching is by prefix.

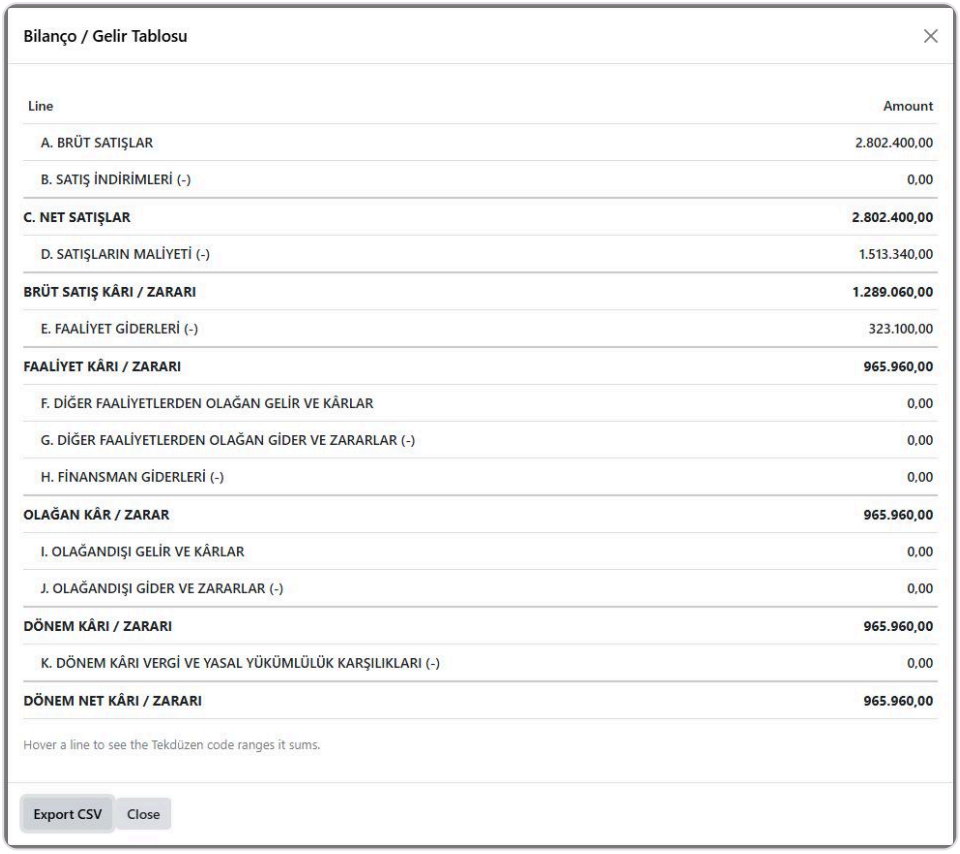

On the demo Aktif and Pasif differ by this year's profit. The report says so in a warning: the period result reaches 590/591 only when the period is closed. Post your closing entries and the two agree.

2 Gelir Tablosu

For the period: A. Brüt Satışlar, B. Satış İndirimleri, C. Net Satışlar, D. Satışların Maliyeti, gross profit, E. Faaliyet Giderleri (the 63x accounts), operating result, other income and expense, finance costs, ordinary and extraordinary items, profit before tax, tax provision and net profit. On the demo, August to October: 2,802,400 TRY net sales, 1,513,340 cost of sales, 323,100 operating expenses, 965,960 net profit.

Under 7/A expenses are booked to 7xx and reflected to 63x at month end (the demo posts a reflection entry each month), which is why they reach the income statement.

Bilanço / Gelir Tablosu

Line	Amount
A. BRÜT SATIŞLAR	2.802.400,00
B. SATIŞ İNDİRİMLERİ (-)	0,00
C. NET SATIŞLAR	**2.802.400,00**
D. SATIŞLARIN MALİYETİ (-)	1.513.340,00
BRÜT SATIŞ KÂRI / ZARARI	**1.289.060,00**
E. FAALİYET GİDERLERİ (-)	323.100,00
FAALİYET KÂRI / ZARARI	**965.960,00**
F. DİĞER FAALİYETLERDEN OLAĞAN GELİR VE KÂRLAR	0,00
G. DİĞER FAALİYETLERDEN OLAĞAN GİDER VE ZARARLAR (-)	0,00
H. FİNANSMAN GİDERLERİ (-)	0,00
OLAĞAN KÂR / ZARAR	**965.960,00**
I. OLAĞANDIŞI GELİR VE KÂRLAR	0,00
J. OLAĞANDIŞI GİDER VE ZARARLAR (-)	0,00
DÖNEM KÂRI / ZARARI	**965.960,00**
K. DÖNEM KÂRI VERGİ VE YASAL YÜKÜMLÜLÜK KARŞILIKLARI (-)	0,00
DÖNEM NET KÂRI / ZARARI	**965.960,00**

Hover a line to see the Tekdüzen code ranges it sums.

Export CSV Close

Both statements have **Posted entries only** or all entries, **Hide empty lines** and **Export CSV**. The company must have a cost method set (Part 4) before either will run.

PART 16 Form Ba/Bs and the declaration datasets

NEEDS: REPORTS

These screens give the figures for the monthly notices and returns, worked out from the same tax engine that made the invoices. They do not file anything: filing stays in GİB's own systems.

IN THIS PART YOU WILL LEARN

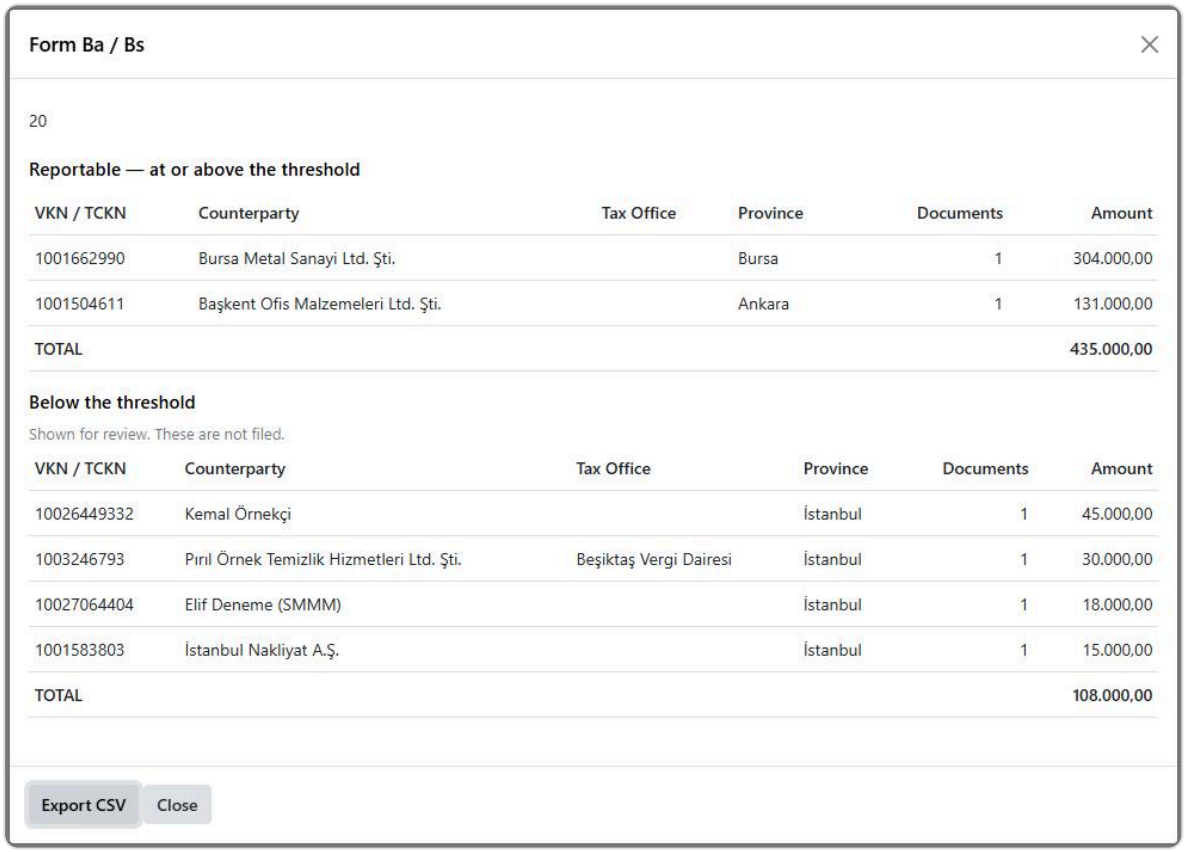

- Form Ba and Form Bs for a month
- KDV-1, KDV-2, Muhtasar and Geçici Vergi
- What "dataset, not a filing" means

TRY IT YOURSELF ON THE DEMO

1. Reporting, Form Ba / Bs: Form Bs, October, Run
2. Reporting, Declaration Datasets: KDV-2, October, Run
3. Same screen: Muhtasar, October, Run

1 Form Ba, purchases

Choose the form, the dates and the **Threshold** (from the company). Counterparties at or above it are reportable, with VKN or TCKN, tax office, province, number of documents and amount. Those below are shown for review only. In October Bursa Metal and Başkent Ofis are reportable; the landlord and the cleaner are below.

Form Ba / Bs

20

Reportable — at or above the threshold

VKN / TCKN	Counterparty	Tax Office	Province	Documents	Amount
1001662990	Bursa Metal Sanayi Ltd. Şti.		Bursa	1	304.000,00
1001504611	Başkent Ofis Malzemeleri Ltd. Şti.		Ankara	1	131.000,00
TOTAL					435.000,00

Below the threshold

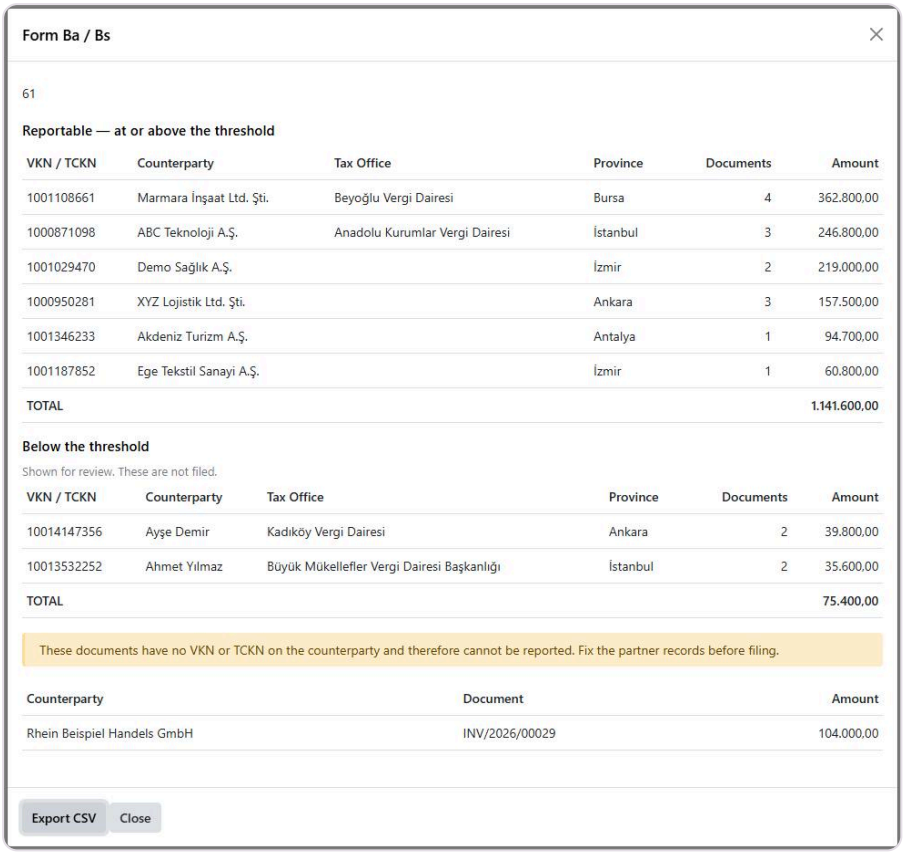

Shown for review. These are not filed.

VKN / TCKN	Counterparty	Tax Office	Province	Documents	Amount
10026449332	Kemal Örnekçi		İstanbul	1	45.000,00
1003246793	Pırıl Örnek Temizlik Hizmetleri Ltd. Şti.	Beşiktaş Vergi Dairesi	İstanbul	1	30.000,00
10027064404	Elif Deneme (SMMM)		İstanbul	1	18.000,00
1001583803	İstanbul Nakliyat A.Ş.		İstanbul	1	15.000,00
TOTAL					108.000,00

Export CSV Close

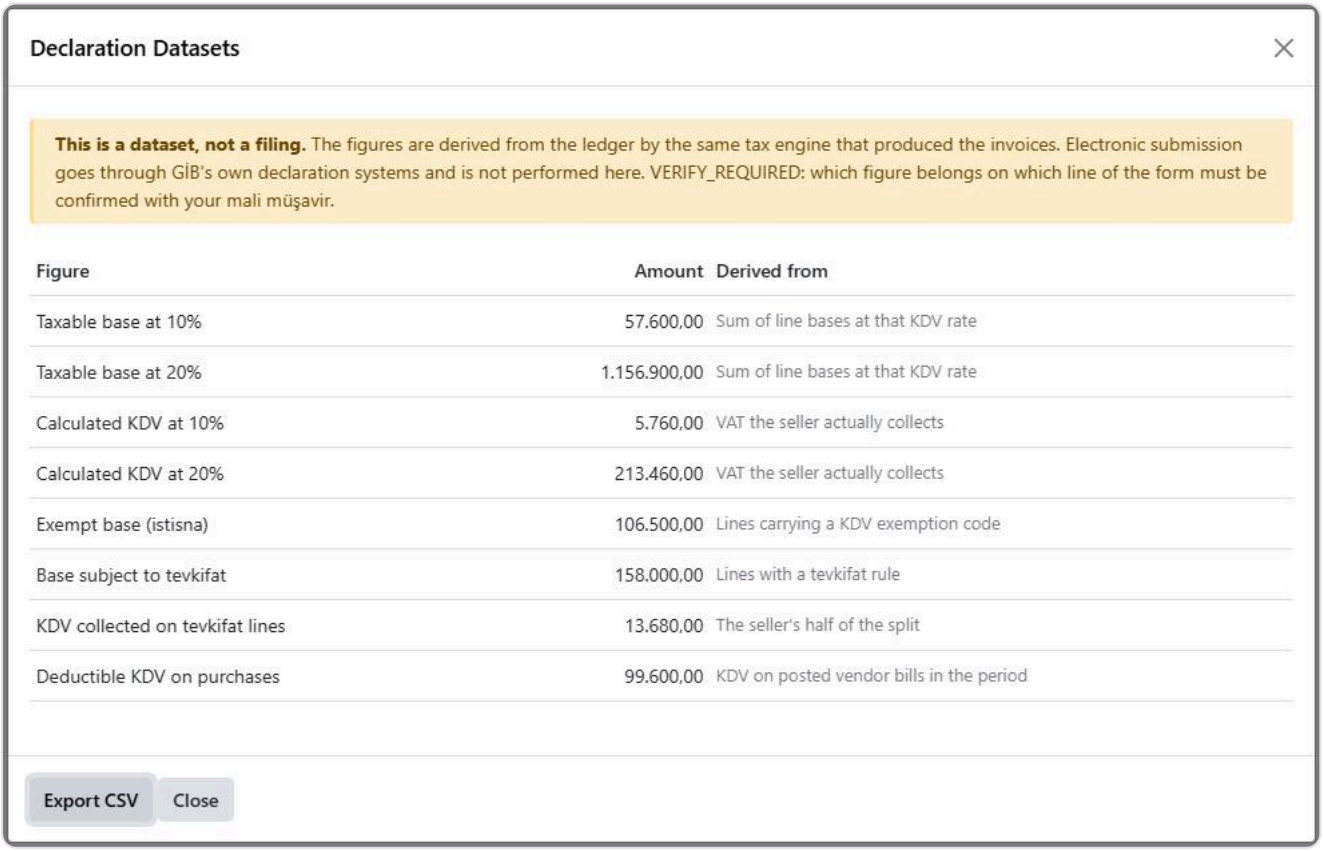

2 Form Bs, sales

Six customers reportable in October. Partners missing a VKN or TCKN are counted at the top so they can be fixed before the notice is prepared. **Export CSV** gives the rows.

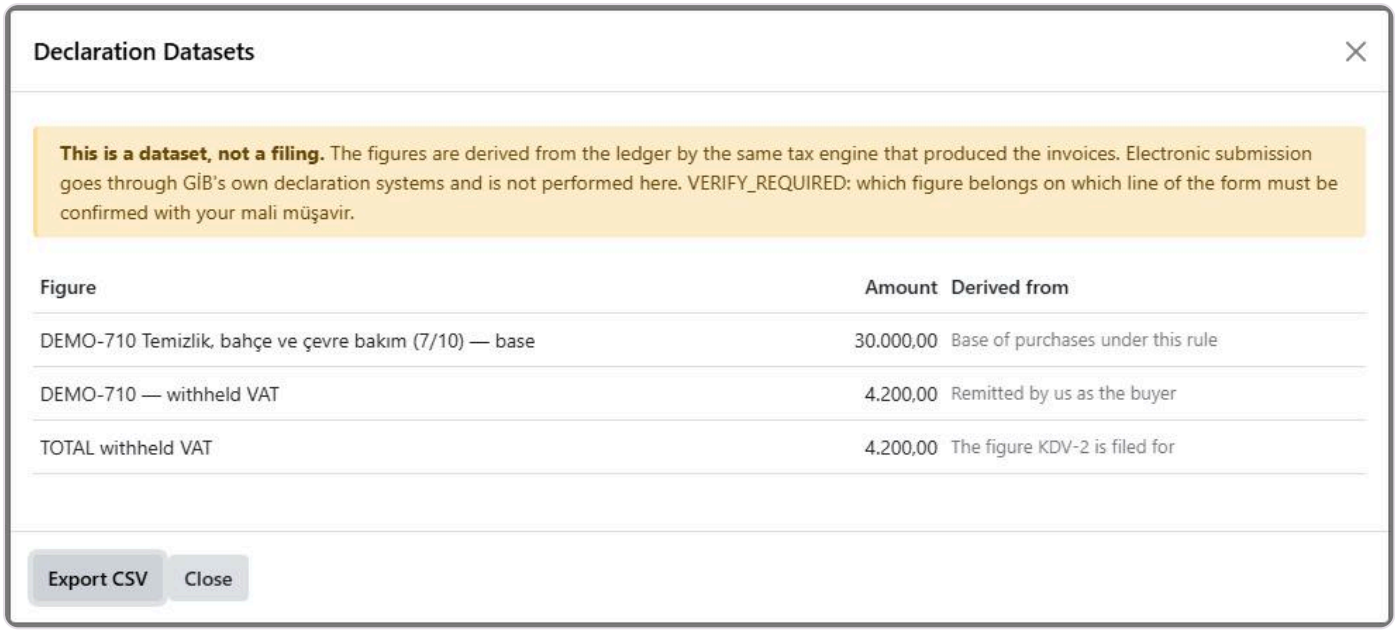

3 KDV-1, VAT on sales

Taxable base and KDV by rate, the exempt base, the base under tevkifat and the seller's share of KDV on it, and deductible KDV on the month's vendor bills. Each figure says where it comes from.

4 KDV-2, VAT withheld as buyer

One pair of lines per tevkifat rule used on purchases: base and VAT withheld. October: the 7/10 cleaning bill, base 30,000, withheld 4,200.

Declaration Datasets

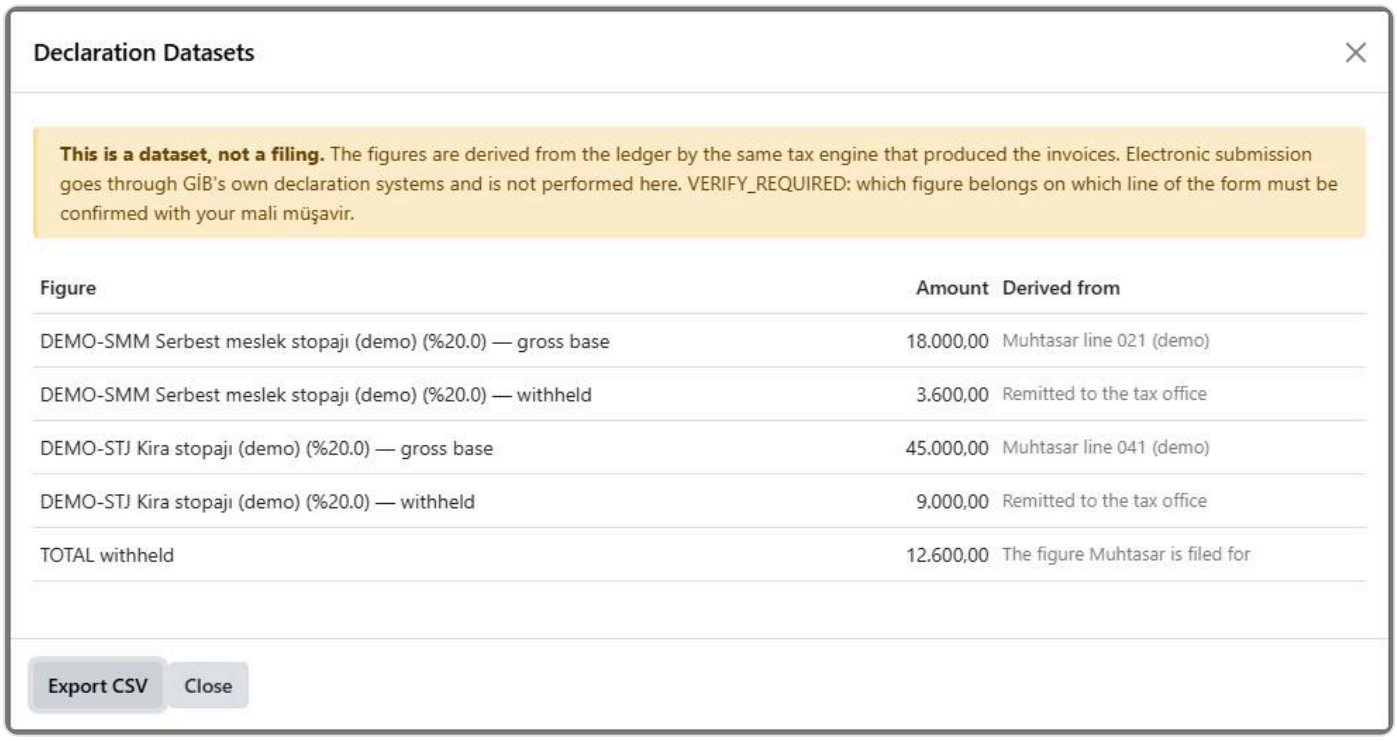

This is a dataset, not a filing. The figures are derived from the ledger by the same tax engine that produced the invoices. Electronic submission goes through GİB's own declaration systems and is not performed here. VERIFY_REQUIRED: which figure belongs on which line of the form must be confirmed with your mali müşavir.

Figure	Amount	Derived from
DEMO-710 Temizlik, bahçe ve çevre bakım (7/10) — base	30.000,00	Base of purchases under this rule
DEMO-710 — withheld VAT	4.200,00	Remitted by us as the buyer
TOTAL withheld VAT	4.200,00	The figure KDV-2 is filed for

Export CSV Close

5 Muhtasar, stopaj

Gross base and amount withheld per stopaj rule, with its Muhtasar code. October: rent 45,000 with 9,000 withheld, the accountant's fee 18,000 with 3,600 withheld.

Declaration Datasets

This is a dataset, not a filing. The figures are derived from the ledger by the same tax engine that produced the invoices. Electronic submission goes through GİB's own declaration systems and is not performed here. VERIFY_REQUIRED: which figure belongs on which line of the form must be confirmed with your mali müşavir.

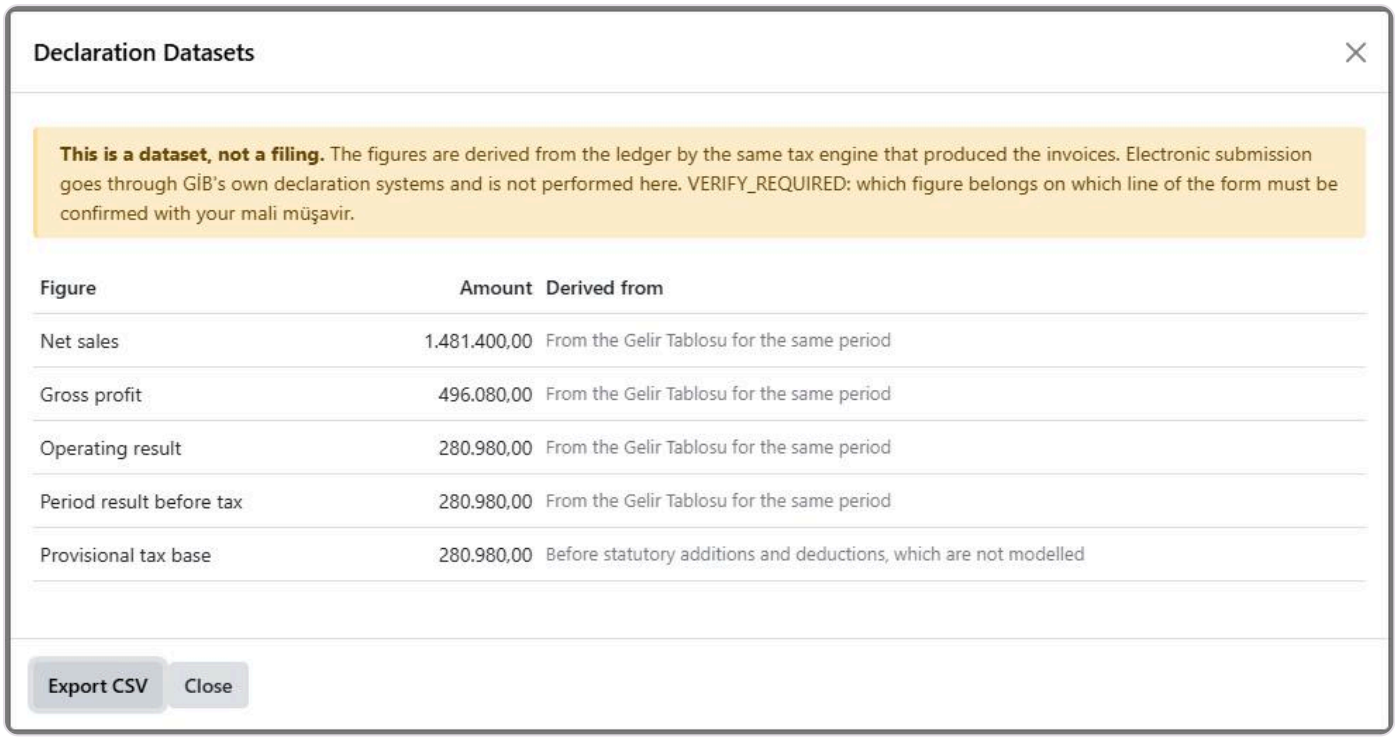

Figure	Amount	Derived from
DEMO-SMM Serbest meslek stopajı (demo) (%20.0) — gross base	18.000,00	Muhtasar line 021 (demo)
DEMO-SMM Serbest meslek stopajı (demo) (%20.0) — withheld	3.600,00	Remitted to the tax office
DEMO-STJ Kira stopajı (demo) (%20.0) — gross base	45.000,00	Muhtasar line 041 (demo)
DEMO-STJ Kira stopajı (demo) (%20.0) — withheld	9.000,00	Remitted to the tax office
TOTAL withheld	12.600,00	The figure Muhtasar is filed for

Export CSV Close

6 Geçici Vergi

The provisional tax base for a quarter, read from the Gelir Tablosu: net sales, gross profit, operating result and period result. July to September on the demo.

Statutory additions and deductions are not modelled; the screen says so.

Every dataset opens with the same statement: it is a dataset, not a filing, and which figure belongs on which line of the form must be confirmed with your mali müşavir.

PART 17 e-Defter, the cost method and partner sub-accounts

NEEDS: REPORTS

e-Defter is the electronic journal and general ledger. The suite prepares and validates the books and builds the package; signing and the berat exchange belong to a certified integrator.

IN THIS PART YOU WILL LEARN

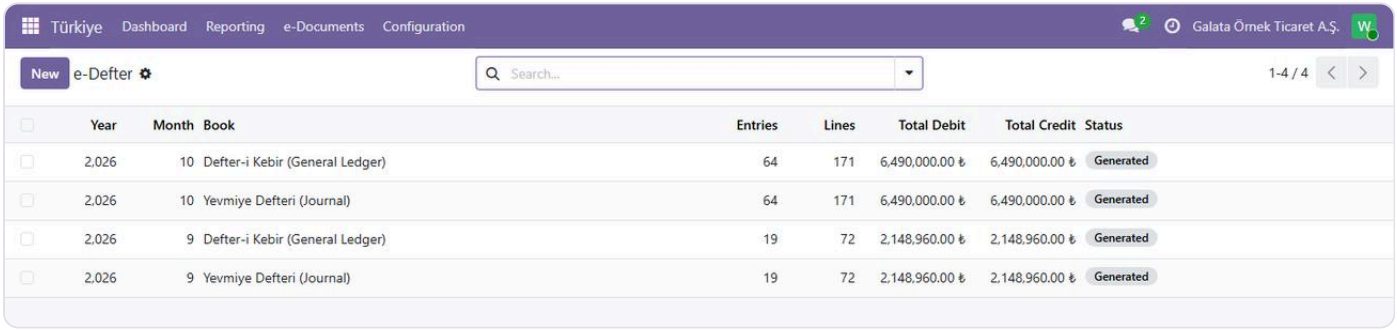

- Generating the journal and the ledger for a month
- The validation report and the package
- What Sign does in this version
- Partner sub-accounts under 120 and 320

TRY IT YOURSELF ON THE DEMO

1. Reporting, e-Defter: open the September Defter-i Kebir
2. Read the Validation and Files tabs

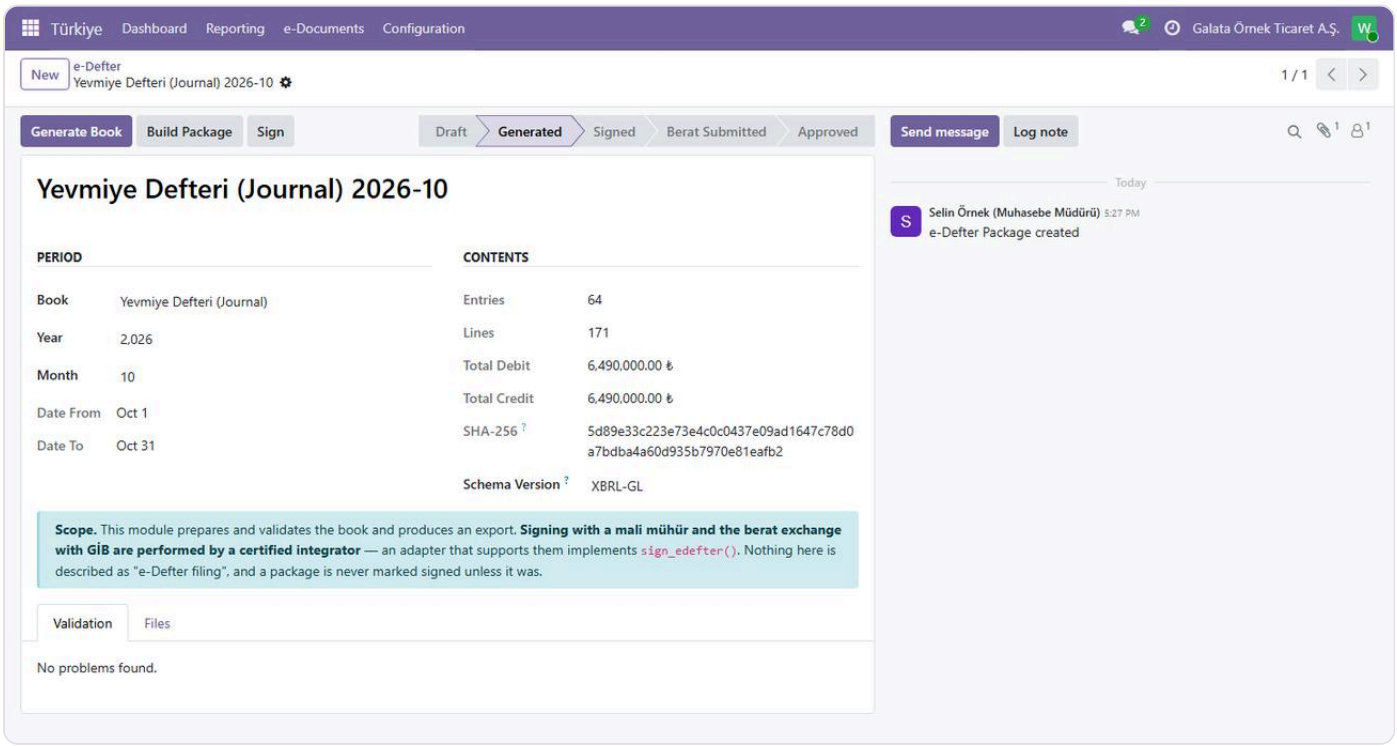

1 Reporting, e-Defter

One package per book per month: **Yevmiye Defteri** (journal) and **Defter-i Kebir** (general ledger), with period, state, entries, lines and totals.

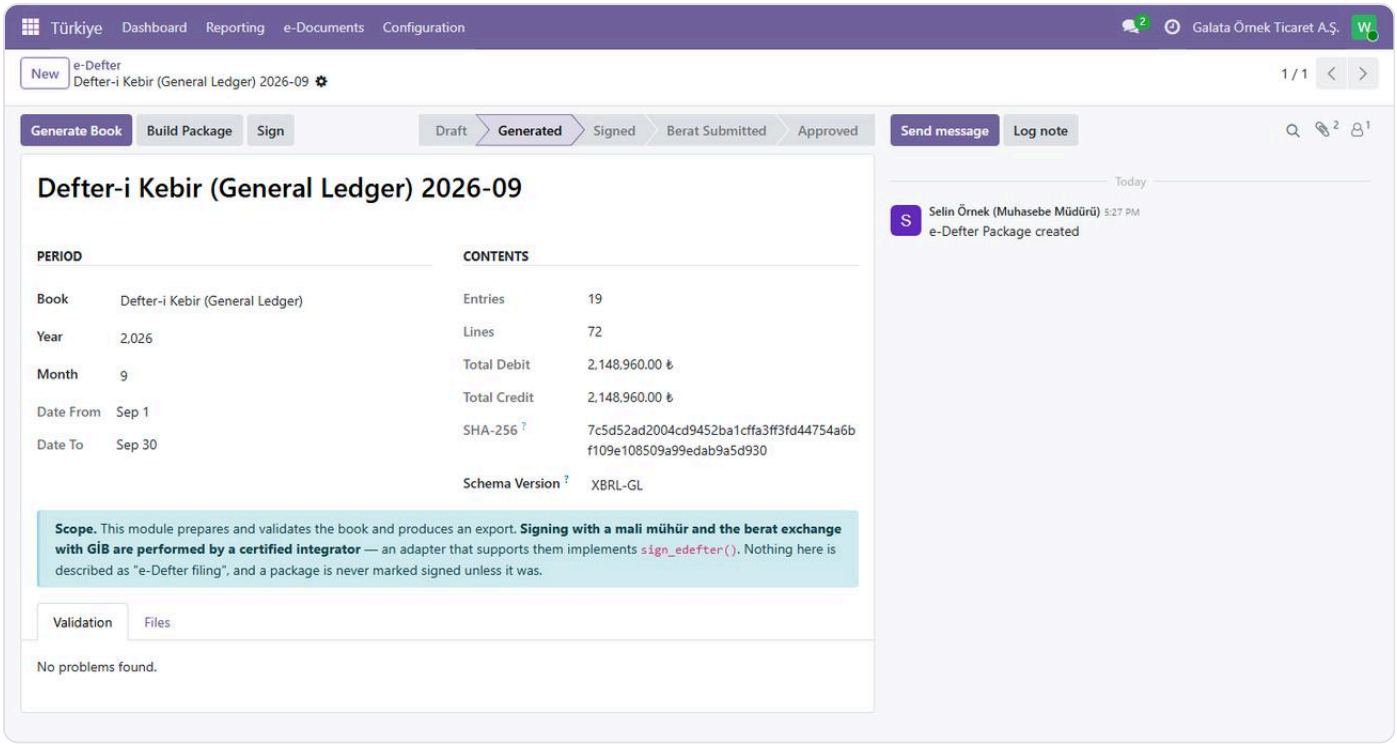

2 Generate Book

Pick the book, year and month and press **Generate Book**. The entries of the month are written into an XBRL-GL style XML and checked: debits against credits and the structure. The October books on the demo are at this stage.

3 Validation

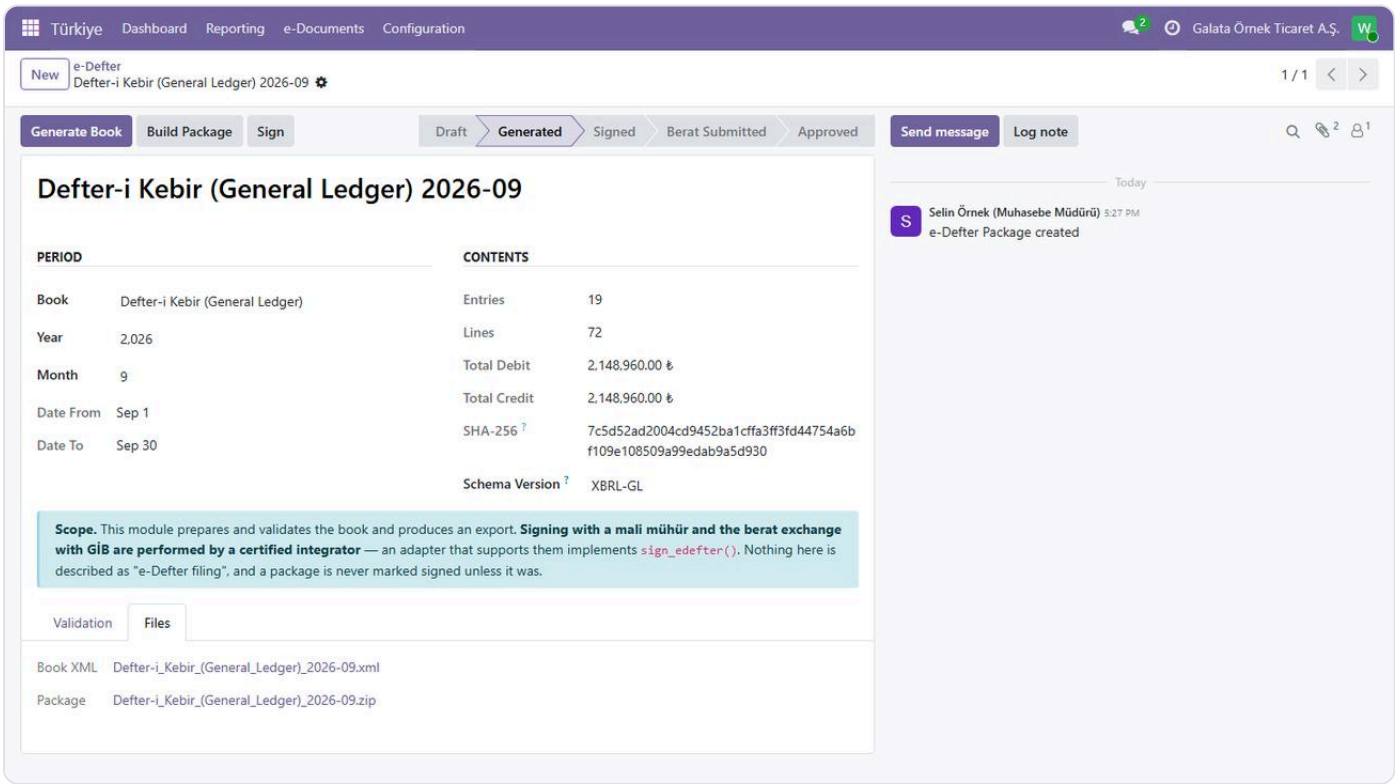

The **Validation** tab holds the report ("No problems found" here), the entry and line counts and the totals.

4 Build Package

Build Package zips the book with a checksum; the **Files** tab holds the XML and the package. September is packaged on the demo.

Sign goes through the integrator. The mock does not sign, so on the demo it explains that signing with a mali mühür and the berat exchange are done by a certified integrator whose adapter implements them. Nothing is marked signed that was not.

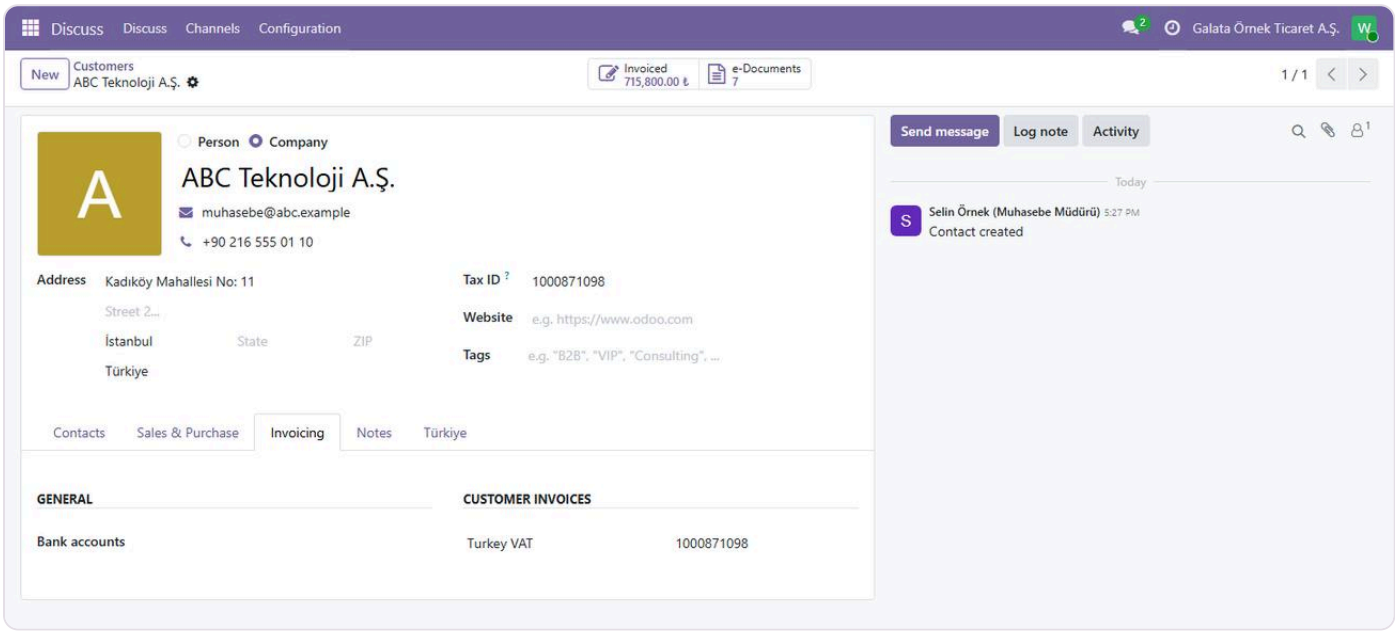

Cost method and sub-accounts

Cost Method on the company is 7/A or 7/B. It has no default and is locked once the company has posted entries, because changing it is an accounting migration, not a setting. The demo uses 7/A.

5 **Generate Sub-Account**

With Partner Sub-Accounts on, a customer or supplier gets a button that creates its own account under the prefixes (120.01, 320.01 ...), numbered from what is already in the chart, and makes it the partner's receivable or payable account. On the demo ABC Teknoloji is 120.01.

From then on that partner's invoices post to its sub-account. Earlier entries stay on 120. The statements and the Mizan pick both up by prefix.

PART 18 Control: audit trail, support package and the demo loader

NEEDS: BASE

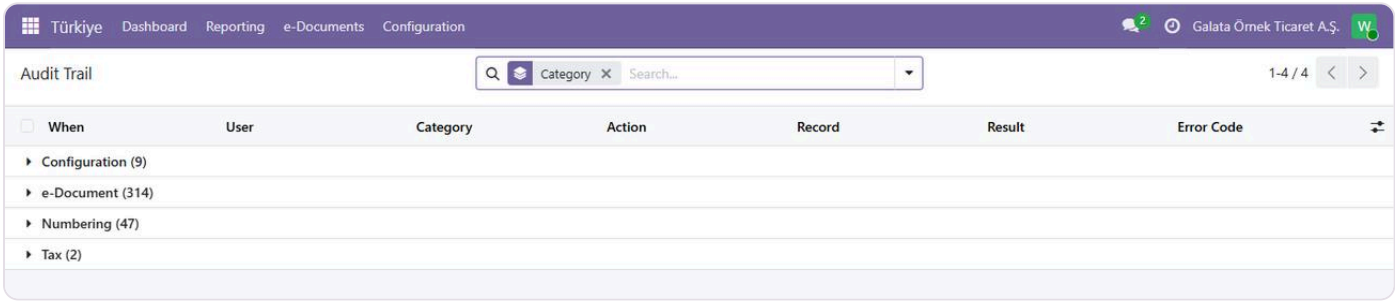

Every Turkish action that matters leaves a record: who did it, to what, before and after, and whether it worked. This part is for the administrator.

IN THIS PART YOU WILL LEARN

- The audit trail and its categories
- The support package, and what is kept out of it
- Loading the demo on a test company

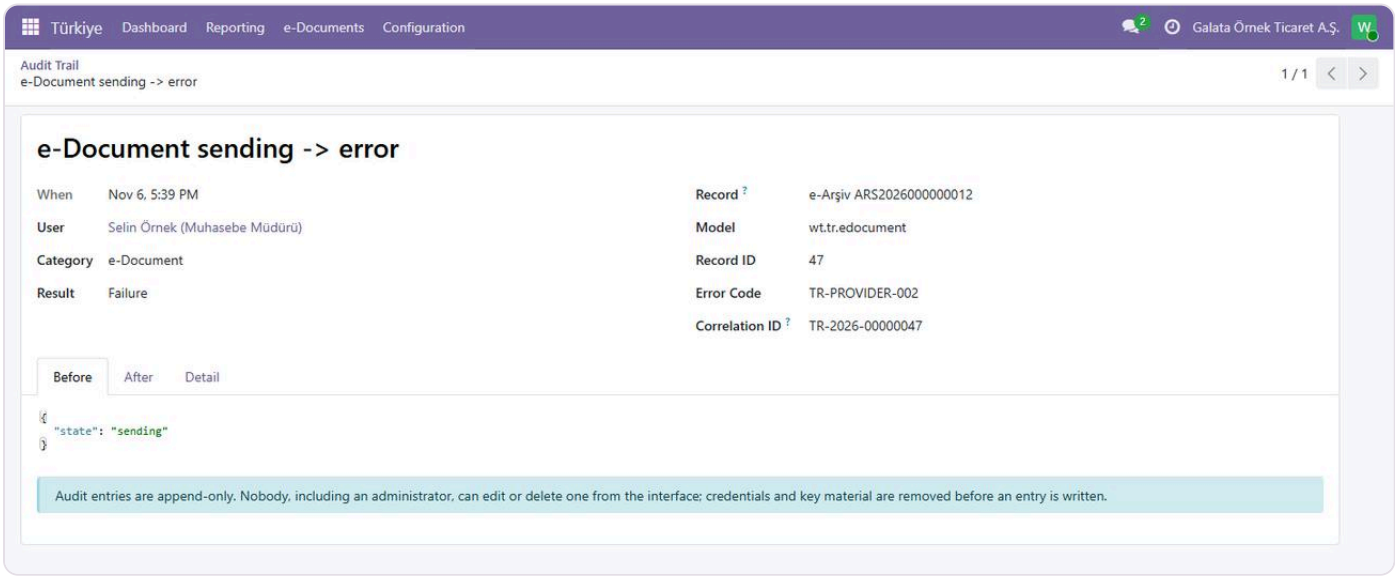

1 Configuration, Technical, Audit Trail

Append-only. Each entry: date, user, action, category (identity, tax, numbering, e-document, integrator, configuration, security), the record, the result, an error code and a correlation id that ties one document's events together. Entries older than 24 months are removed monthly.

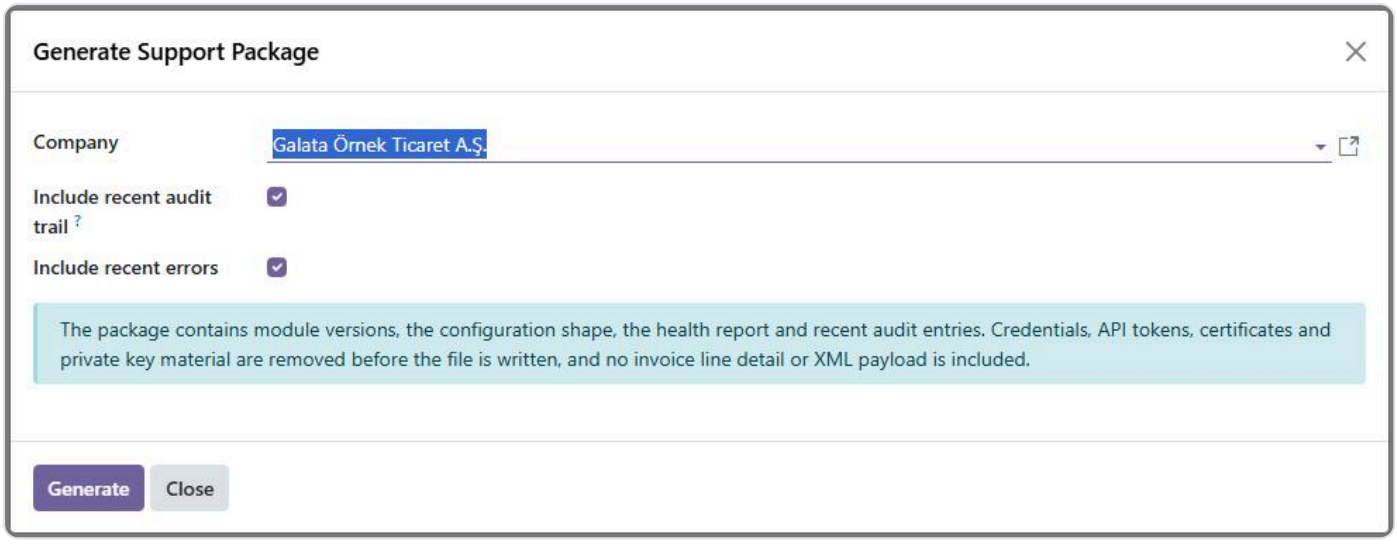

2 An entry

Before and **After** as JSON, and **Detail**. Secrets are redacted when the entry is written.

3 **Support Package**

Generate a zip for whoever supports you: environment, company, health, configuration and, if ticked, the last 200 audit entries and recent errors. Secrets are redacted again on the way out.

The demo loader

SUITE **Configuration, Technical, Load Demo Data** (Turkish System Administrator) builds the module's own demo on the current company: the Türkiye chart if it is missing, invented customers, suppliers and two people with valid-checksum numbers, products, four tevkifat rules, an exemption code and a stopaj rule (all unverified), the three series, the GİB list, invoices driven through the mock to accepted, pending, rejected and timed out, and three incoming invoices. It can be run more than once and is refused on a Production company. Galata Örnek's three months of history were added on top of it for this guide.

PART 19 A fifteen minute walk-through

If you have the demo open and fifteen minutes, this path shows the whole suite. It is also the order to show it to somebody else in.

#	DO THIS	AND NOTICE
1	Türkiye, Dashboard	Two red alerts (a dead-lettered document, a GİB rejection) and two amber ones (an unknown sender, a commercial invoice to answer). Configuration health at the bottom.
2	Contacts, ABC Teknoloji A.Ş., Türkiye tab	VKN, tax office, province, district, registered for e-Fatura, sub-account 120.01.
3	Invoicing, INV/2026/00042	Routing Reason: why this is an e-Fatura. Scenario TEMELFATURA, type SATIS, the ETTN.
4	Its e-Document button, Console tab	Validated, numbered, built, sent, answered, PDF retrieved.
5	Invoicing, INV/2026/00043	The 2/10 tevkifat split: 3,600 KDV, 720 withheld by the buyer, 2,880 collected, 20,880 to pay.
6	Invoicing, INV/2026/00044	A person with a TCKN, so e-Arşiv.
7	e-Documents, Error Queue, the rejection	The GİB code, the reason in Turkish and English, the suggested fix.
8	e-Documents, Inbox, TIC2026000000107	A commercial invoice waiting for Accept or Reject, and its draft bill.
9	Inventory, WH/OUT/00002, e-İrsaliye tab	Plate, driver, carrier and the accepted delivery note.
10	Reporting, Mizan, Run	The trial balance at three digits, balanced.
11	Reporting, Bilanço / Gelir Tablosu	Gelir Tablosu for August to October: 965,960 TRY net profit.
12	Reporting, Declaration Datasets, Muhtasar, October	Rent and fee stopaj, 12,600 TRY withheld.

Questions people ask

QUESTION	ANSWER
Does it need Odoo Enterprise?	No. It runs on Odoo 19 Community with Invoicing; e-İrsaliye also needs Inventory.
Can it send to GİB today?	Not out of the box. This version ships the mock integrator only. A real connection needs an adapter for your integrator, written against the suite's interface.
Which integrators are supported?	None by name in this version. The design is integrator-neutral: one adapter per provider, chosen on the integrator record.
Do I have to choose e-Fatura or e-Arşiv on each invoice?	No. It is chosen from the customer's identity and the GİB list, and the reason is written on the invoice.
Are tevkifat ratios and stopaj rates included?	No rates are shipped. You keep the rules, with dates and a Verified tick that a Production company requires.
Does it file KDV or Muhtasar returns?	No. It produces the figures for each return; filing stays with GİB's own systems.

Does it sign the e-Defter?	No. It builds and validates the books and the package. Signing and the berat go through a certified integrator.
Can I send credit notes and export invoices?	Not in this version: credit notes fail to build and foreign buyers are refused for having no VKN (Part 10).
Will it overwrite my chart of accounts?	No. It never installs or replaces a chart. Load l10n_tr yourself; the demo loader does it only on an empty company.
Is ÖTV calculated on invoices?	No. ÖTV rules are configuration only in this version.

PART 20

The menu map

Every screen in the suite, on one page.

Dashboard

Dashboard	Alerts, today, the month, health

Reporting

Mizan	Trial balance by Tekdüzen level
Bilanço / Gelir Tablosu	Balance sheet or income statement
Form Ba / Bs	Purchases and sales per counterparty
Declaration Datasets	KDV-1, KDV-2, Muhtasar, Geçici
e-Defter	Journal and ledger book packages

e-Documents

Outbox	Outgoing documents not yet settled
Inbox	Incoming invoices
Review Queue	Incoming with no supplier match
Error Queue	Errors and rejections
All Documents	Every e-document
e-Arşiv Daily Reports	One report per day

Configuration

Setup Wizard	Ten steps from zero
Localization Health	Every check, with a fix
Taxes	Tevkifat, stopaj, exemption codes, ÖTV
e-Documents	Integrators, UBL-TR schema, series, GİB list, mock inbox
Master Data	Provinces, districts, tax offices
Technical	Background jobs, audit trail, support package, demo loader

Elsewhere in Odoo

Contacts	Türkiye tab, GİB registration, sub-account
Products	Tevkifat, stopaj, exemption, GTİP
Taxes	Türkiye tab: tax type, GİB code
Invoices and bills	Routing, scenario, type, KDV split
Deliveries	e-İrsaliye tab: vehicle, driver

Want this for your company?

We install the suite on your Odoo 19, load the Türkiye chart and your partners with clean VKN and TCKN, set the tax rules with your mali müşavir, and connect it to your integrator. In this version a real integrator needs its adapter written, which we scope with you from your integrator's API.
