COMPLETE GUIDE · EVERY DASHBOARD, CARD, TAB AND FILTER

Dashboards for Odoo 19

Sales, CRM, Purchase, Inventory, POS, Accounting and Project dashboards, and a Dashboard Builder for boards of your own. Every screen shown on a live demo with a year of data. No Odoo background needed.

START

About this guide

Seven ready-made dashboards, one for each of the main Odoo apps, and a builder for boards of your own. This guide walks through every one of them: every card, every tab, every filter and every button, on a live demo with a year of data. You do not need to have used Odoo before.

Who it is for

The owner or manager who wants the morning numbers on one screen, the person setting the modules up, and anyone being shown the suite for the first time.

How to read it

Parts 1 to 3 explain the suite, setup and the layout every board shares. Parts 4 to 10 take one board each. Part 11 is the builder. The back covers a fifteen minute demo, questions people ask and the menu map.

The live demo

Northwind Trading LLC, an invented office supplies and furniture distributor in Dubai, with a year of sales, purchases, invoices and payments, six months of POS trading on two counters, a CRM pipeline and five projects.

HOW IT WORKS

The demo company

Address	**dashboards-demo.way4tech.com**
Sign in	**w4demo / Demo2026**
Company	Northwind Trading LLC, Al Quoz, Dubai · currency AED · VAT 5%
Runs on	Odoo 19, Community edition, no Enterprise module installed
Data	420 sales orders, 130 purchase orders, about 540 invoices and bills, 727 POS orders, 230 leads and opportunities, 5 projects with 45 tasks and timesheets

The demo is shared and resets from time to time, so treat it as a showroom, not your own books. The figures in the screenshots are from the day they were taken; the demo moves on every day, so yours will differ.

What is in the guide

PART 1	What the suite is and what it adds to Odoo	PART 2	Signing in and setting up from zero
PART 3	How every dashboard works	PART 4	The Sales dashboard
PART 5	The CRM dashboard	PART 6	The Purchase dashboard
PART 7	The Inventory dashboard	PART 8	The POS dashboard
PART 9	The Accounting dashboard	PART 10	The Project dashboard
PART 11	The Dashboard Builder	PART 12	A fifteen minute walk-through
PART 13	Questions people ask	PART 14	The menu map

PART 1 What the suite is and what it adds to Odoo

Odoo already records everything a dashboard needs: every order, invoice, stock move, lead and task. What it does not have in Community is a screen per app that answers the morning questions without being built first. That is what these modules add.

IN THIS PART YOU WILL LEARN

- What standard Odoo 19 Community already shows, and what it does not
- The eight modules, what each costs and what it depends on
- Which app tile each module adds to the home screen
- How the ready-made dashboards differ from the builder

TRY IT YOURSELF ON THE DEMO

1. Sign in to the demo and look at the home screen: find the seven Analytics tiles and Dashboards
2. Open Sales, Reporting, Sales to see standard Odoo's own pivot report for comparison

The questions a manager asks every morning

How much did we sell, and is it more than last month? Which quotations are still open? What did we spend and with whom? Which bills are overdue? What is low in the warehouse? How much did the tills take today, and when are we busy? What do customers owe us, and how old is it? Which deals are stuck, and which follow-ups are late? Which tasks went past their deadline? Each question lives in a different app, and in standard Odoo each needs a report set up with the right filters and groupings before it answers.

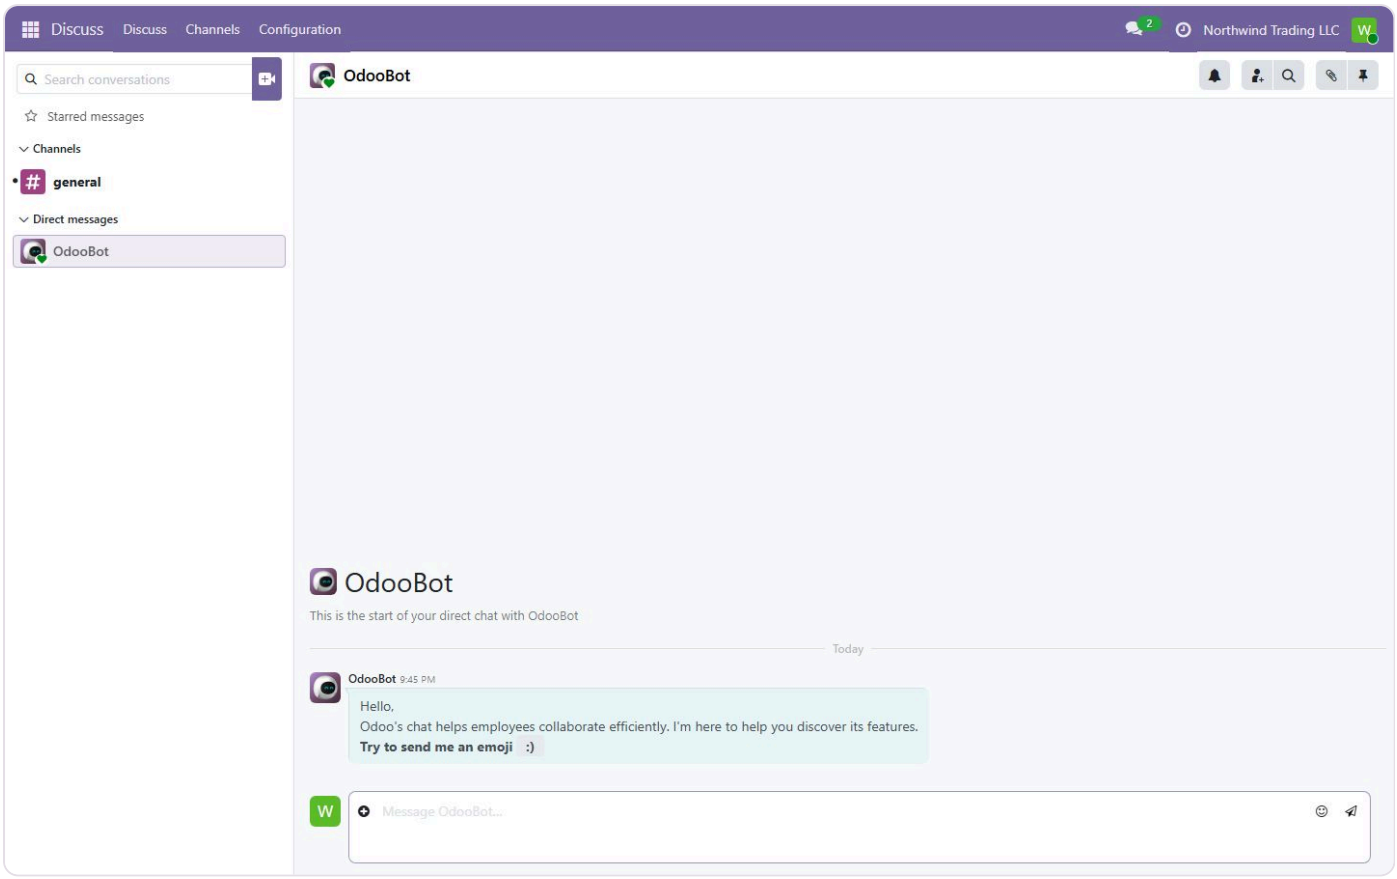

What Odoo 19 Community already gives you

Every app has a **Reporting** menu with pivot, graph and list views over its own records, which can be grouped, filtered and saved as favourites. Odoo 19 Community also ships a **Dashboards** app built on spreadsheets with ready-made boards for the installed apps; you can read those, but editing them is an Enterprise feature. What is missing is a fixed set of headline figures per app with one period switch, a comparison with the previous period, and lists you act on, such as overdue bills or low stock.

The eight modules

MODULE	TECHNICAL NAME	PRICE	NEEDS	ADDS THE APP
Sales Dashboard	wt_sale_dashboard	USD 20	Sales	Sales Analytics
CRM Dashboard	wt_crm_dashboard	USD 20	CRM	CRM Analytics
Purchase Dashboard	wt_purchase_dashboard	USD 20	Purchase	Purchase Analytics
Stock and Inventory Dashboard	wt_inventory_dashboard	USD 20	Inventory	Inventory Analytics
POS Dashboard	wt_pos_dashboard	USD 20	Point of Sale	POS Analytics
Accounting Dashboard	wt_accounting_dashboard	USD 20	Invoicing	Accounting Analytics
Project Dashboard	wt_project_dashboard	USD 20	Project	Project Analytics
Dashboard Builder	wt_dashboard_builder	USD 10	nothing but Odoo itself	Dashboards

Every module is a one-time purchase on the Odoo Apps store, built and tested on Odoo 19 Community, and each depends only on the app it reports on. Install only the ones you need.

The demo home screen. Each dashboard is its own app tile, next to the app it reads.

Two kinds of board

Ready-made dashboards

Seven boards with a fixed design: nine headline cards, a row of tabs with charts and tables, a period switch and a comparison with the previous period. Nothing to configure. They count for the whole company.

Dashboard Builder

Boards you design: tiles pointed at any model with a measure, a filter and a grouping. No period switch and no charts over time, but it works on any model, including custom modules, and reads with each viewer's own access rights.

Used together

A common pattern is the ready-made board per department, and one builder board for the owner with the five figures they ask about every day.

PART 2 Signing in and setting up from zero

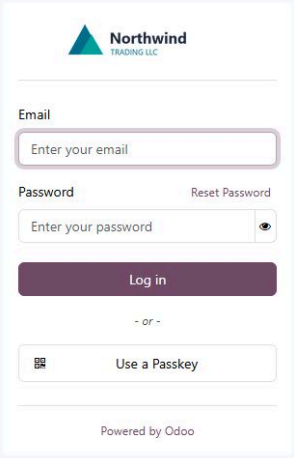

There is no settings page in any of the eight modules. Setting up is installing the right apps, giving the right people the right groups, and making sure the data the boards count is entered in Odoo the way they expect.

IN THIS PART YOU WILL LEARN

- How to sign in to the demo
- The install order
- Which user group opens which dashboard
- The Odoo settings and habits each board depends on

TRY IT YOURSELF ON THE DEMO

1. Sign in as w4demo / Demo2026
2. Open the user menu at the top right and check the time zone: Asia/Dubai

The sign-in page of the demo. Use the shared demo login; it is not an administrator.

Install order

1

Install the standard apps

Sales, Purchase, Inventory, Point of Sale, Invoicing, CRM and Project, whichever you use. Each dashboard needs its own app first.

2

Install the dashboards

From Apps, install each dashboard module you bought. It adds one app tile and a Dashboard menu inside it. Nothing else changes in Odoo.

3

Install the builder

Dashboard Builder adds the Dashboards app and a sample board called Business Overview on contacts and users.

4

Check user groups

Use the table below to decide who sees which board, then adjust the groups on each user in Settings, Users.

The boards count company-wide, so this is the one decision that matters.

Who opens which dashboard

APP TILE	SHOWN TO	NOTES
Sales Analytics	Sales: User (own or all documents), Sales Administrator	A salesperson on own documents only still sees company totals

CRM Analytics	Every internal user	The menu has no sales group; consider limiting it
Purchase Analytics	Purchase: User, Administrator	
Inventory Analytics	Inventory: User, Administrator	
POS Analytics	Point of Sale: Administrator only	Cashiers with POS User rights do not see it
Accounting Analytics	Invoicing: Billing Administrator, or full accounting features	Plain Billing users do not see it
Project Analytics	Project: User, Administrator	Counts include private projects
Dashboards (builder)	Every internal user can view; Dashboard Designer can build	Tiles read with the viewer's rights

The seven ready-made boards read straight from the database for the current company. Record rules, such as a salesperson seeing only their own orders or a private project, do not narrow the totals. Clicking a card opens a normal Odoo list, which does respect the user's rights. Only the builder reads with each viewer's own rights.

What each board needs in Odoo

BOARD	SET THIS UP	WHY
Sales	Confirm orders in Odoo; fill Salesperson; cancel dead quotations	Revenue, conversion and the salesperson ranking come from these
CRM	Mark as Won / Lost; Source on leads; next activities; Expected Revenue; company on sales teams	Won, lost, sources and overdue follow-ups read these fields
Purchase	Confirm POs; payment terms on vendors; post bills	Spend and overdue bills depend on them
Inventory	Reorder rules on the location you count	The low stock list is driven only by reorder rules
POS	A cost on every product; one Odoo user per cashier; POS categories	Margin, cashier figures and category charts
Accounting	Payment terms; post invoices and bills; register payments	Receivables, aging and overdue invoices
Project	Fold the Done stage; deadlines on tasks; assignees	Done and overdue are worked out from folded stages and deadlines

PART 3 How every dashboard works

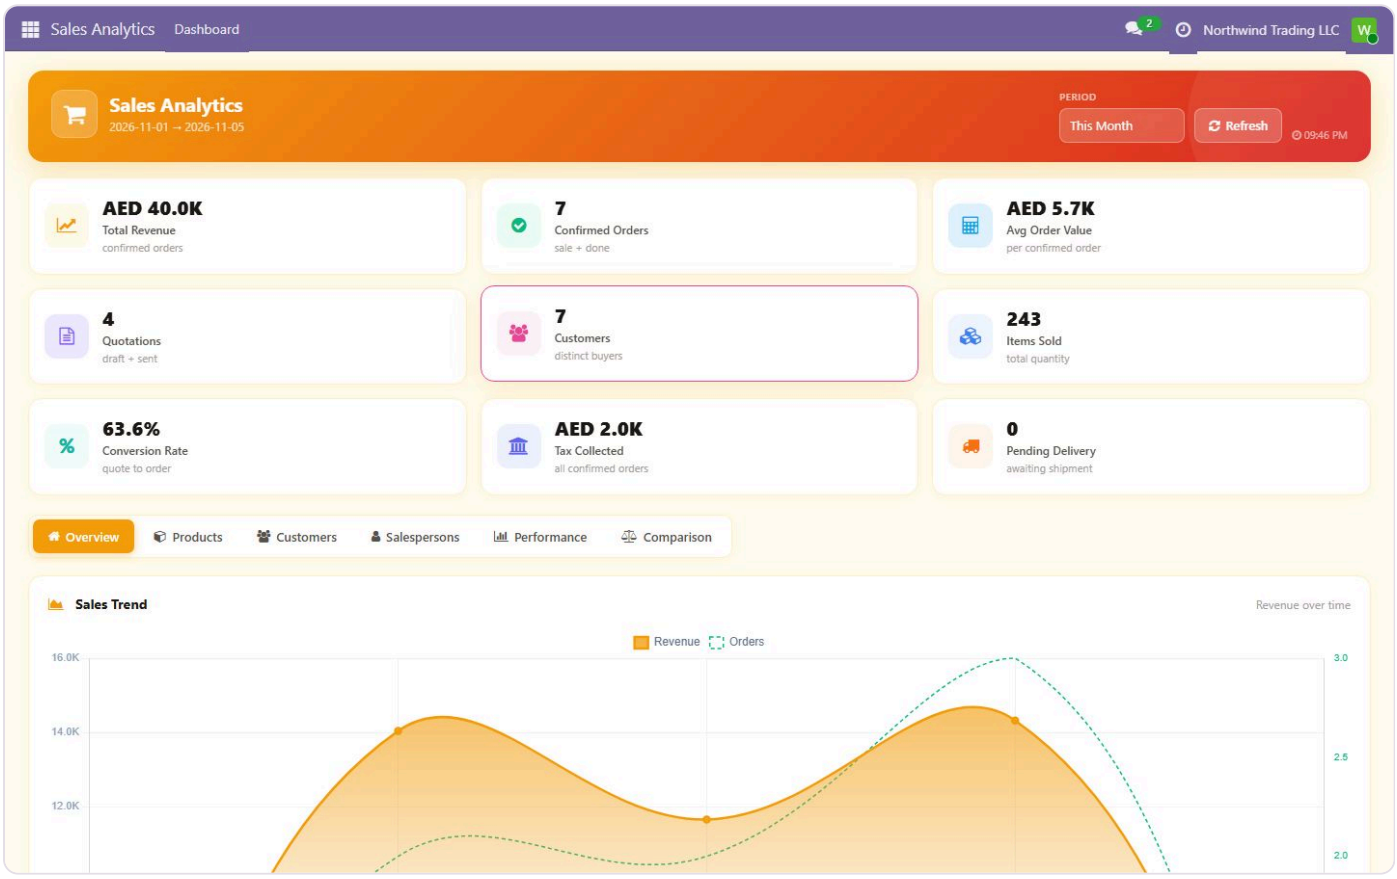

The seven ready-made boards share one layout. Learn it once on the Sales board and the other six read the same way: a header with the period, nine cards, a row of tabs, and a comparison at the end.

IN THIS PART YOU WILL LEARN

- The nine periods and the custom range
- What the cards do when you click them
- How tabs, tables and Export CSV work
- How the comparison period is chosen
- Refresh and the five minute reload

TRY IT YOURSELF ON THE DEMO

1. Open Sales Analytics and switch the period from This Month to This Year
2. Pick Custom Range and enter two dates
3. Click the Total Revenue card and come back with the breadcrumb

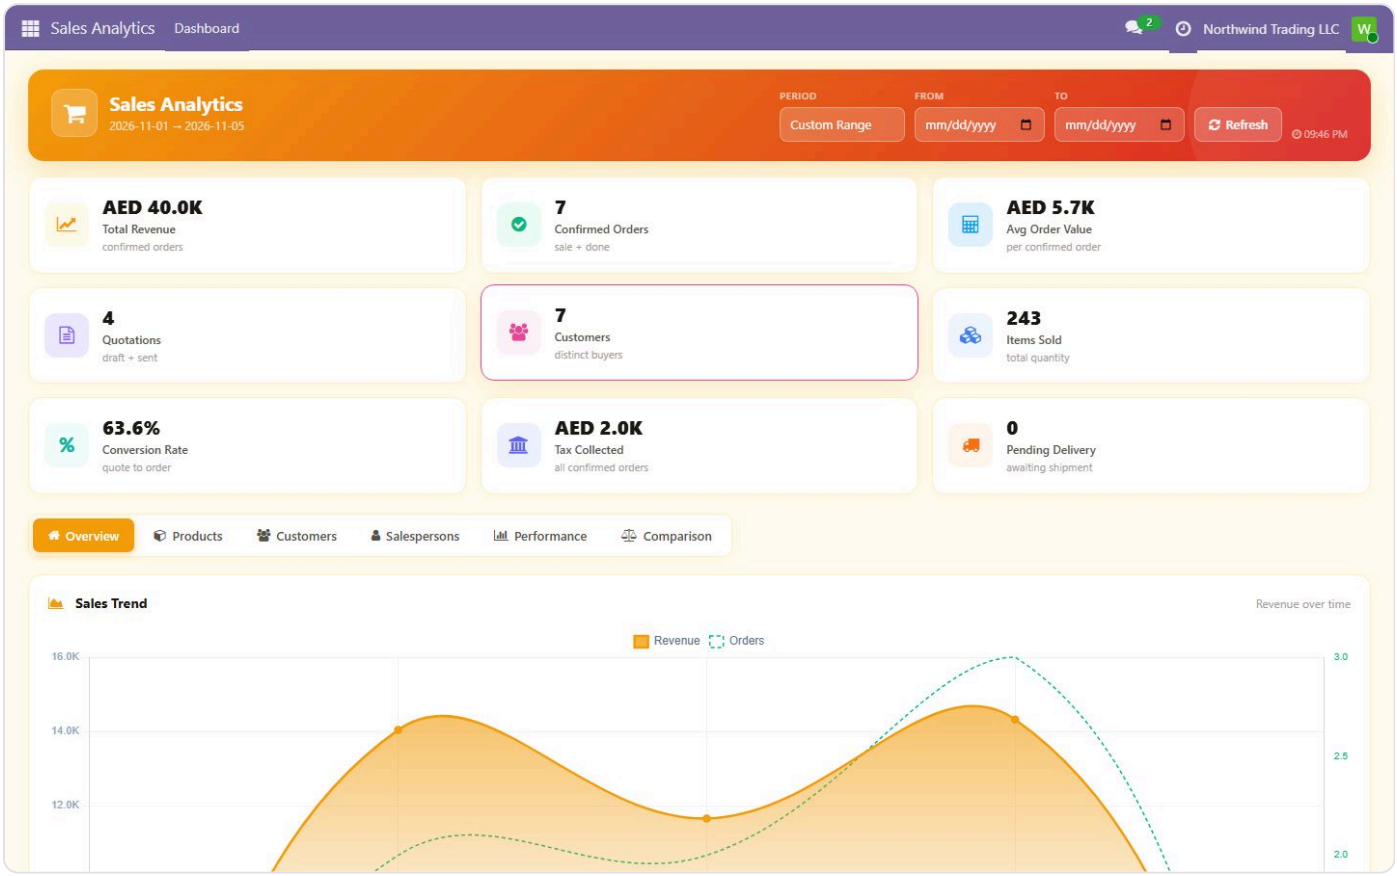

Sales Analytics as it opens: This Month, nine cards, then the tabs.

The period

PERIOD	FROM	TO
Today	today	today
Yesterday	yesterday	yesterday
Last 7 Days	six days ago	today
Last Week	last Monday week	last Sunday
This Month	the 1st of this month	today
Last Month	the 1st of last month	its last day

This Quarter	the first day of the quarter	today
This Year	1 January	today
Custom Range	the From date you enter	the To date you enter

Every board opens on **This Month** except POS, which opens on **Today**. The dates in use are printed under the board's title, so there is never any doubt what a card covers. Dates are worked out on the server's clock, which on most hosted Odoo is UTC.

Custom Range shows a From and a To box. The board reloads once both are filled.

Cards, tabs and tables

1

Read the card

Each card has the figure, its name and a short line saying what it counts. Money is shortened with K and M, in the company currency.

2

Click through

Most cards open the Odoo list behind the figure: the orders, the bills, the leads. Use the breadcrumb to come back.

Some lists behind a card are built on a wider rule than the card; the chapters point these out.

3

Change tab

The tabs group charts and tables by subject. The cards stay on top.

4

Export a table

Tables such as Recent Orders have an Export CSV button. It saves the rows on screen, at most twenty, with the figures as shown.

The POS board's header export is different: it saves every order line in the period.

The comparison

The last tab of every board sets the chosen period against the period of the same length just before it. This Month on the 5th compares the 1st to the 5th with the five days before; This Year on 5 November compares 1 January to 5 November with the same number of days before 1 January. A percentage arrow shows the change.

> The comparison chart, and on the Sales board the salesperson chart, are drawn before their tab has finished appearing. The first time you open the tab, or after changing the period, the chart can be empty. Click the tab again and it draws.

Refresh

The Refresh button in the header reloads every figure, and the time of the last load shows beside it. The Sales, Purchase, Inventory, Accounting, CRM and Project boards also reload on their own every five minutes while they are open. POS and the builder reload only when you click Refresh.

PART 4 The Sales dashboard

Booked sales, open quotations, conversion, the best customers and products, and who on the team is selling. Everything here counts sales orders on their order date.

IN THIS PART YOU WILL LEARN

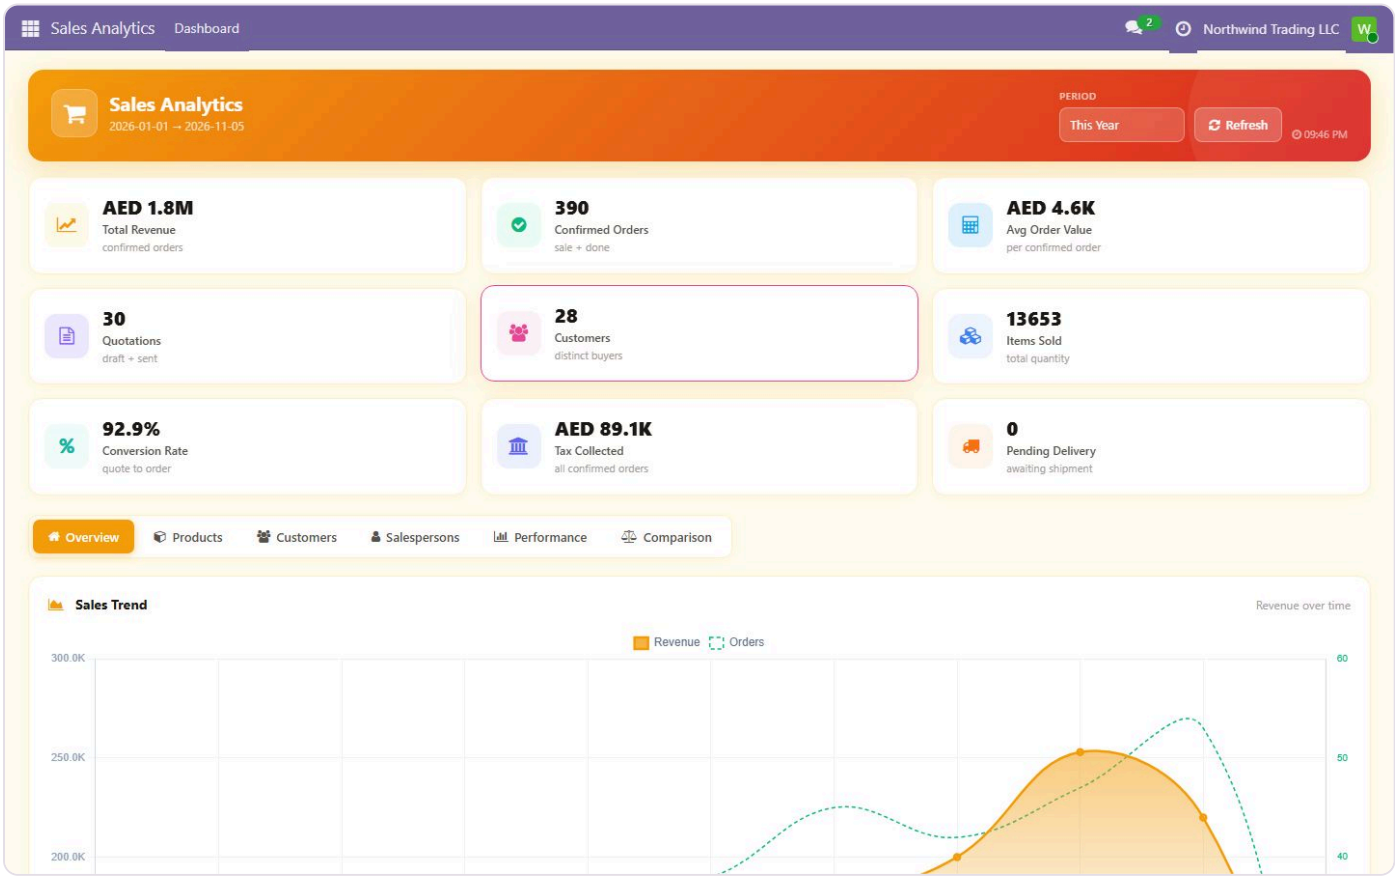

- What each of the nine sales cards counts
- The six tabs and what each answers
- How revenue here differs from invoiced revenue
- The habits that keep conversion honest

TRY IT YOURSELF ON THE DEMO

1. Open Sales Analytics, set This Year and read Total Revenue
2. Open the Products tab and compare the two top ten charts
3. Open Salespersons and click the tab a second time if the chart is empty

Opening the board

Module	Sales Dashboard (wt_sale_dashboard, USD 20)
App tile and menu	Sales Analytics, Dashboard
Who sees it	Sales users and sales administrators
Opens on	This Month
Filters	Period (nine options and Custom Range) and the Refresh button. No salesperson or customer filter.
Counts	Sales orders of the current company whose order date is in the period

The Sales board on This Year.

The nine cards

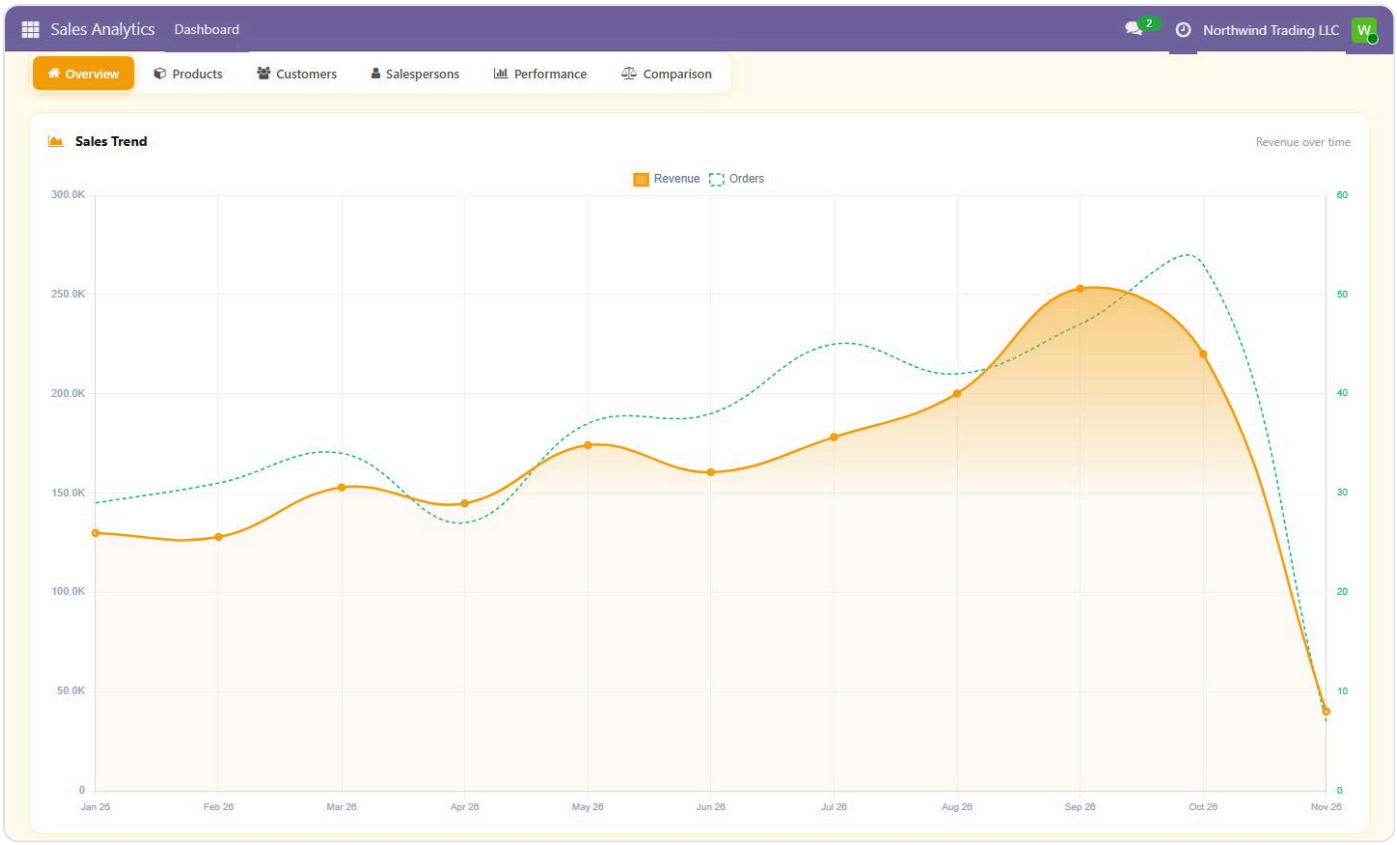

CARD	WHAT IT COUNTS	PERIOD?	CLICK OPENS
Total Revenue	Untaxed total of confirmed orders	yes	Those orders
Confirmed Orders	Number of confirmed orders	yes	Those orders
Avg Order Value	Untaxed average per confirmed order	yes	Confirmed orders
Quotations	Orders in Quotation or Quotation Sent	yes	Those quotations
Customers	Different customers with a confirmed order	yes	All customers
Items Sold	Quantity on confirmed order lines, whole units	yes	All order lines
Conversion Rate	Confirmed / (confirmed + open quotations)	yes	Orders
Tax Collected	Tax on confirmed orders	yes	Orders
Pending Delivery	Always 0 in this version	no	Every delivery not done or cancelled

> Revenue counts on the order date, so it is booked sales. An order confirmed on the 30th belongs to that month even if it is invoiced the next. For invoiced revenue use the Accounting board (Part 9).

The tabs

Overview

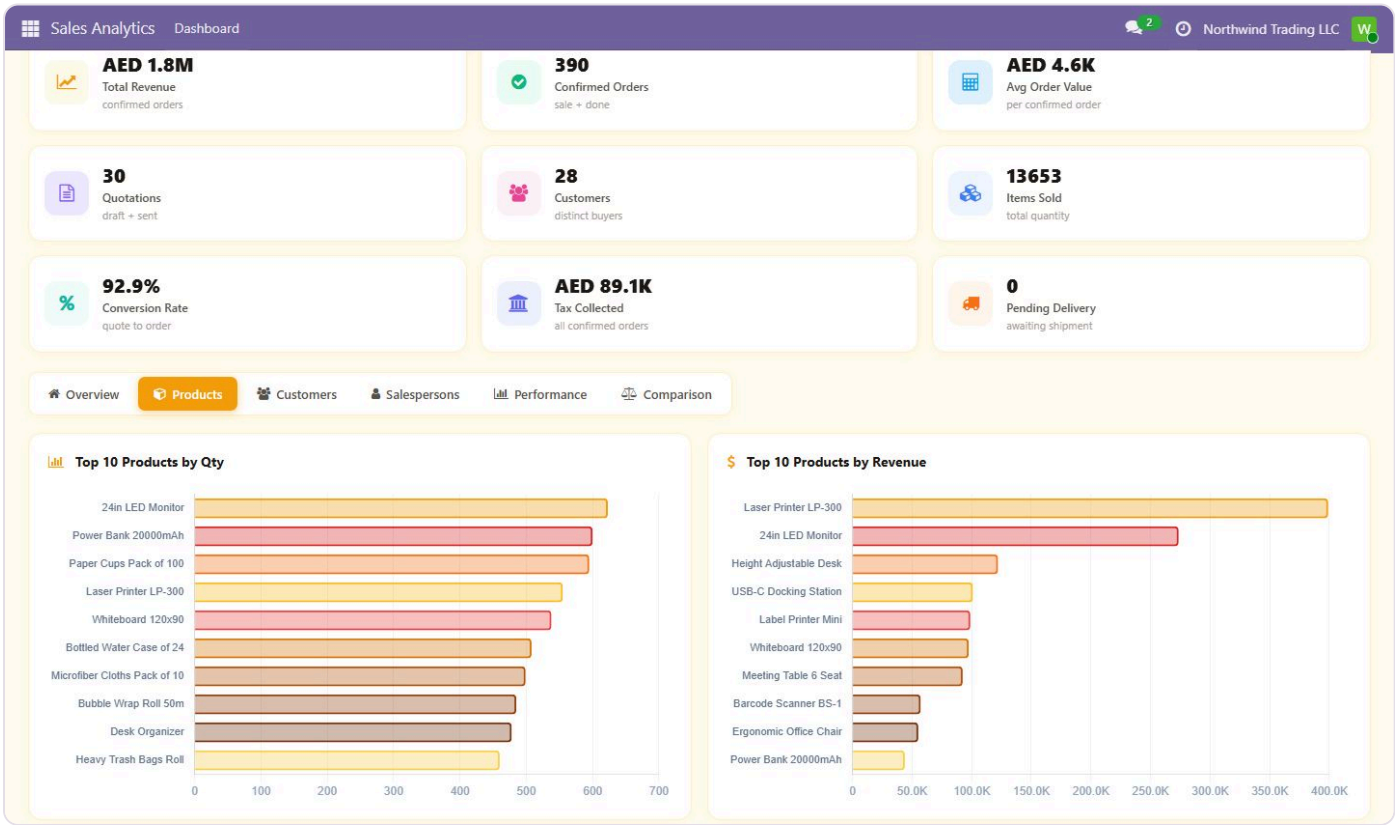

The Sales Trend: untaxed revenue as a filled line and the number of orders as a dashed line on its own scale on the right. Ranges of 90 days or less are plotted by day, longer ranges by month. Below it, Recent Orders lists the 20 latest orders in the period in any state, with the customer, date, untaxed and total amount and status, and an Export CSV button. Click a row to open the order.

Overview: the monthly trend for the year.

Products

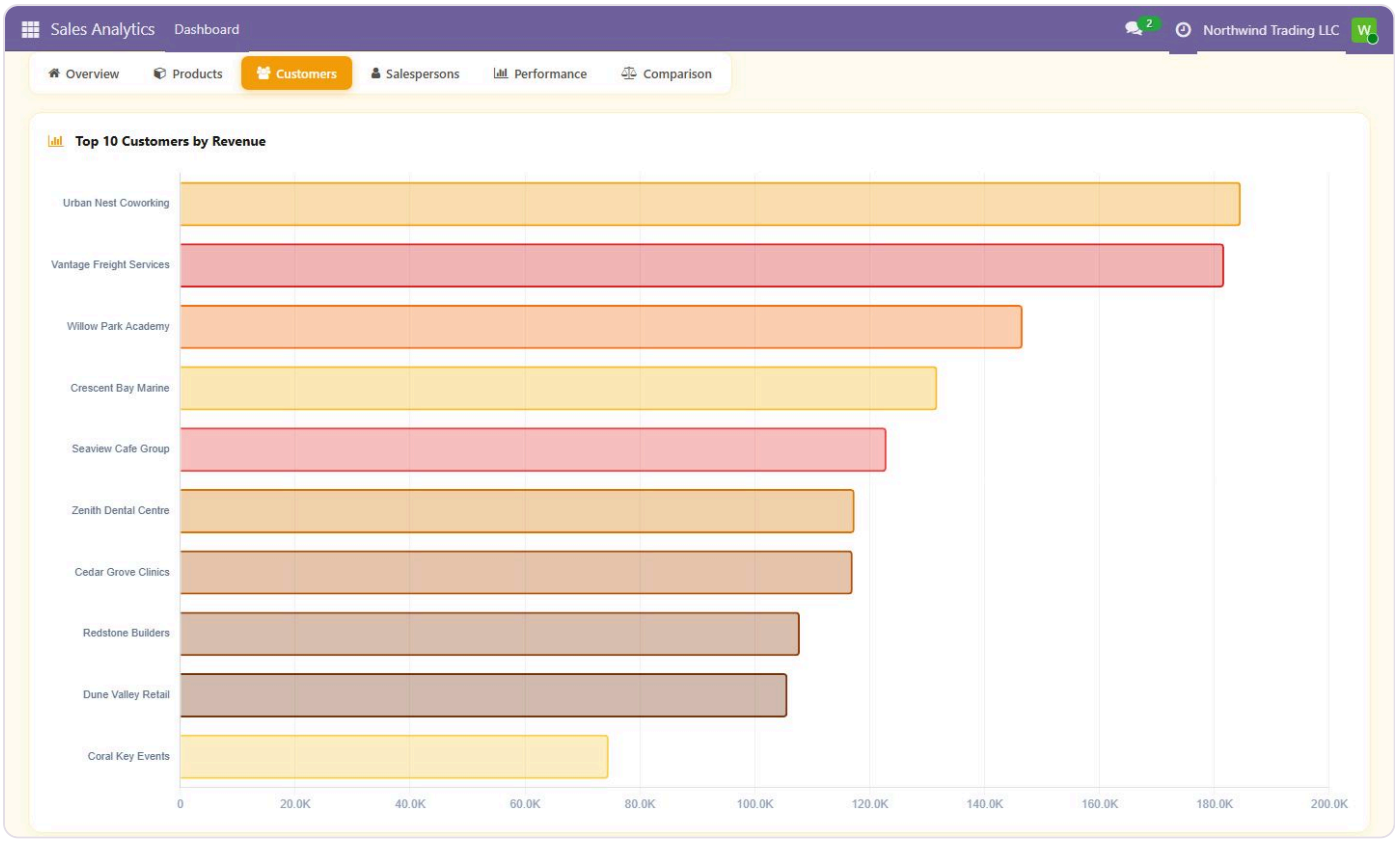

Top 10 Products by Qty and Top 10 Products by Revenue (untaxed line totals). A cheap fast seller shows on the left and not the right.

Products: volume against value.

Customers

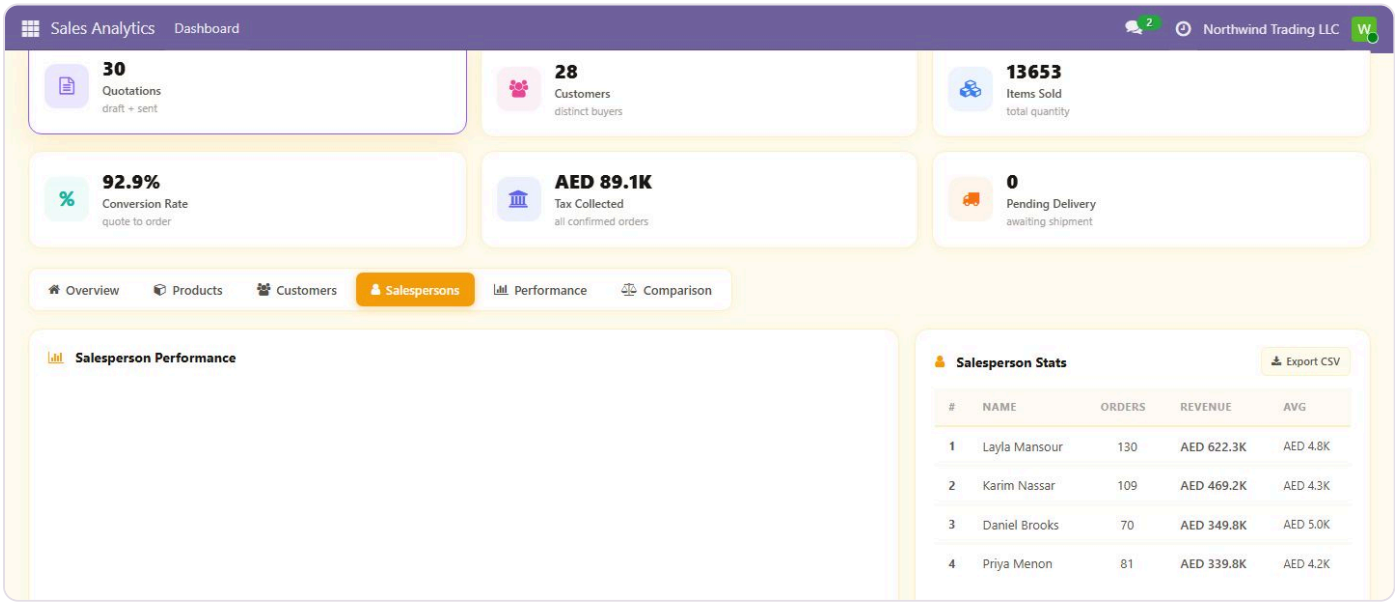

Top 10 Customers by untaxed revenue on confirmed orders.

Customers: who buys the most.

Salespersons

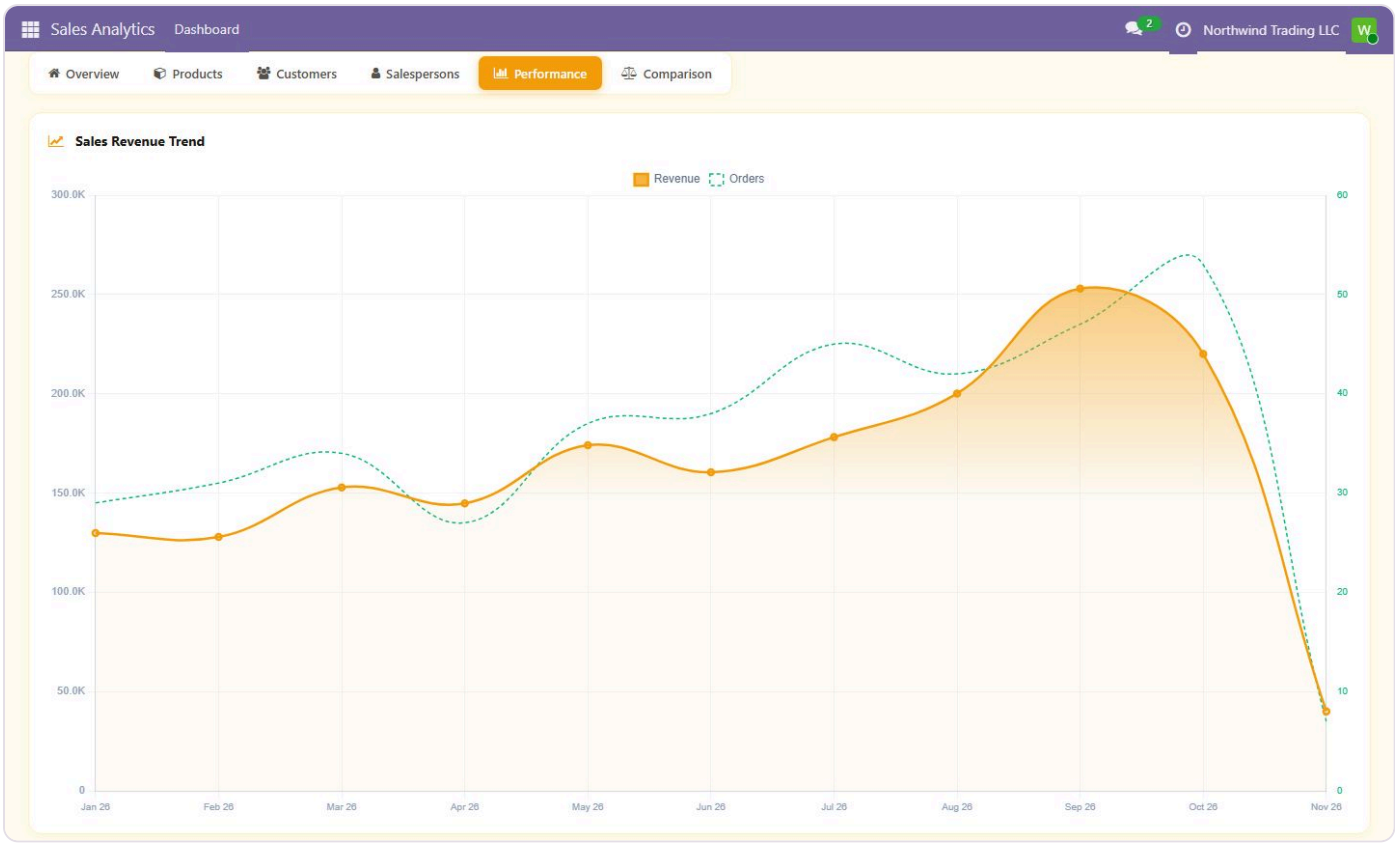

A Salesperson Performance chart and a Salesperson Stats table with each person's orders, revenue and average order, from the Salesperson field on the order, with Export CSV.

Salespersons: the stats table ranks the team.

Performance

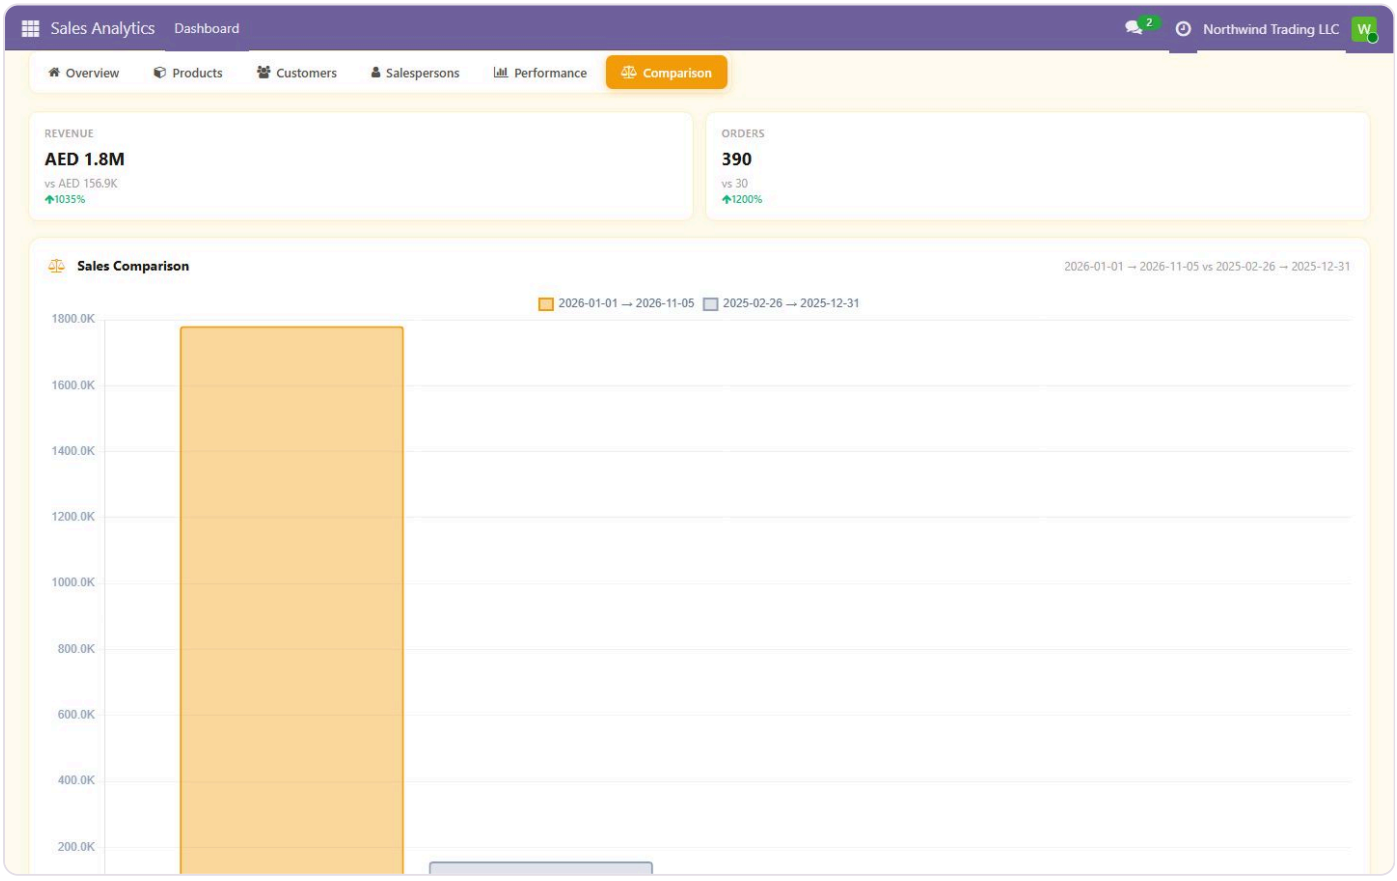

The same trend chart as the Overview, on its own.

Performance.

Comparison

Revenue and orders for this period and the one of the same length before, with the change in percent.

Comparison: this period against the one before.

Getting the figures right

1

Confirm in Odoo

An order agreed by phone is still a quotation until someone clicks Confirm.

2

Fill Salesperson

Orders without one are left out of the Salespersons tab.

3

Cancel dead quotations

Old drafts stay in the Quotations card for their period and pull conversion down.

4

One name per product

Product charts group by name, so two products with one name are added together.

Limits in this version

- No salesperson or customer filter, although the store listing mentions them.
- Pending Delivery is always 0; its click opens the right list.
- Salespeople with the same name, and customers with the same name, are merged.
- The salesperson chart reads the shortened figures (12.5K), so its bars can be on mixed scales; trust the table.
- Items Sold drops fractions; the comparison covers revenue and orders only.
- The listing's Financial tab, target line and new against returning customers are not in this version.

PART 5 The CRM dashboard

New leads and opportunities, deals won and lost, win rate, pipeline value by stage, lead sources and the follow-ups that are already late.

IN THIS PART YOU WILL LEARN

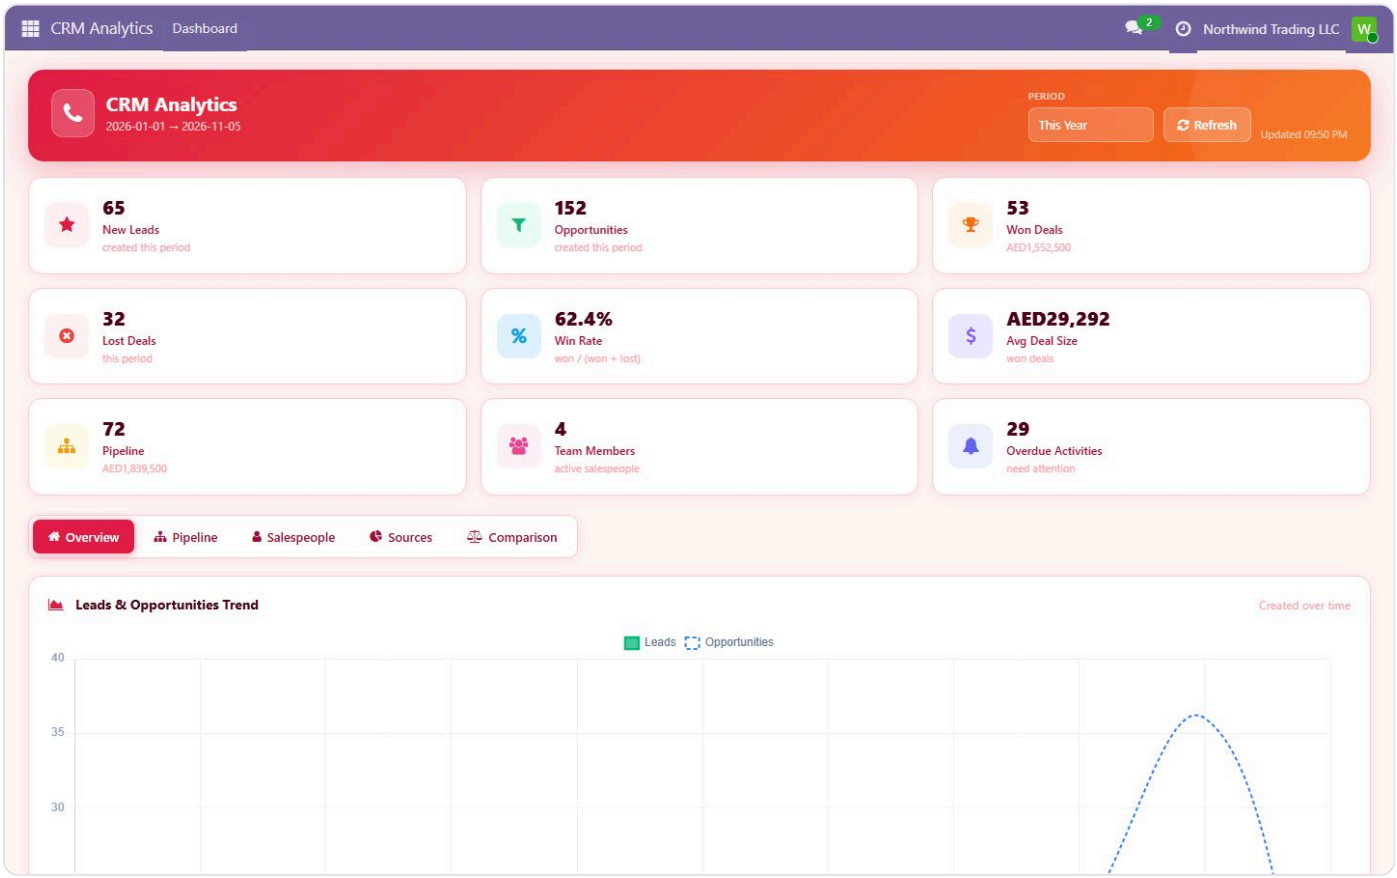

- What each of the nine CRM cards counts
- How won and lost are decided
- Pipeline by stage and leads by source
- What the sales team has to enter

TRY IT YOURSELF ON THE DEMO

1. Open CRM Analytics on This Year
2. Click Overdue Activities and look at the list
3. Open the Pipeline and Sources tabs

Opening the board

Module	CRM Dashboard (wt_crm_dashboard, USD 20)
App tile and menu	CRM Analytics, Dashboard
Who sees it	Every internal user (the menu has no sales group)
Opens on	This Month
Filters	Period (nine options and Custom Range) and the Refresh button. No salesperson or stage filter.
Counts	Leads and opportunities whose company is the current company (leads with no company are not counted)

The CRM board on This Year.

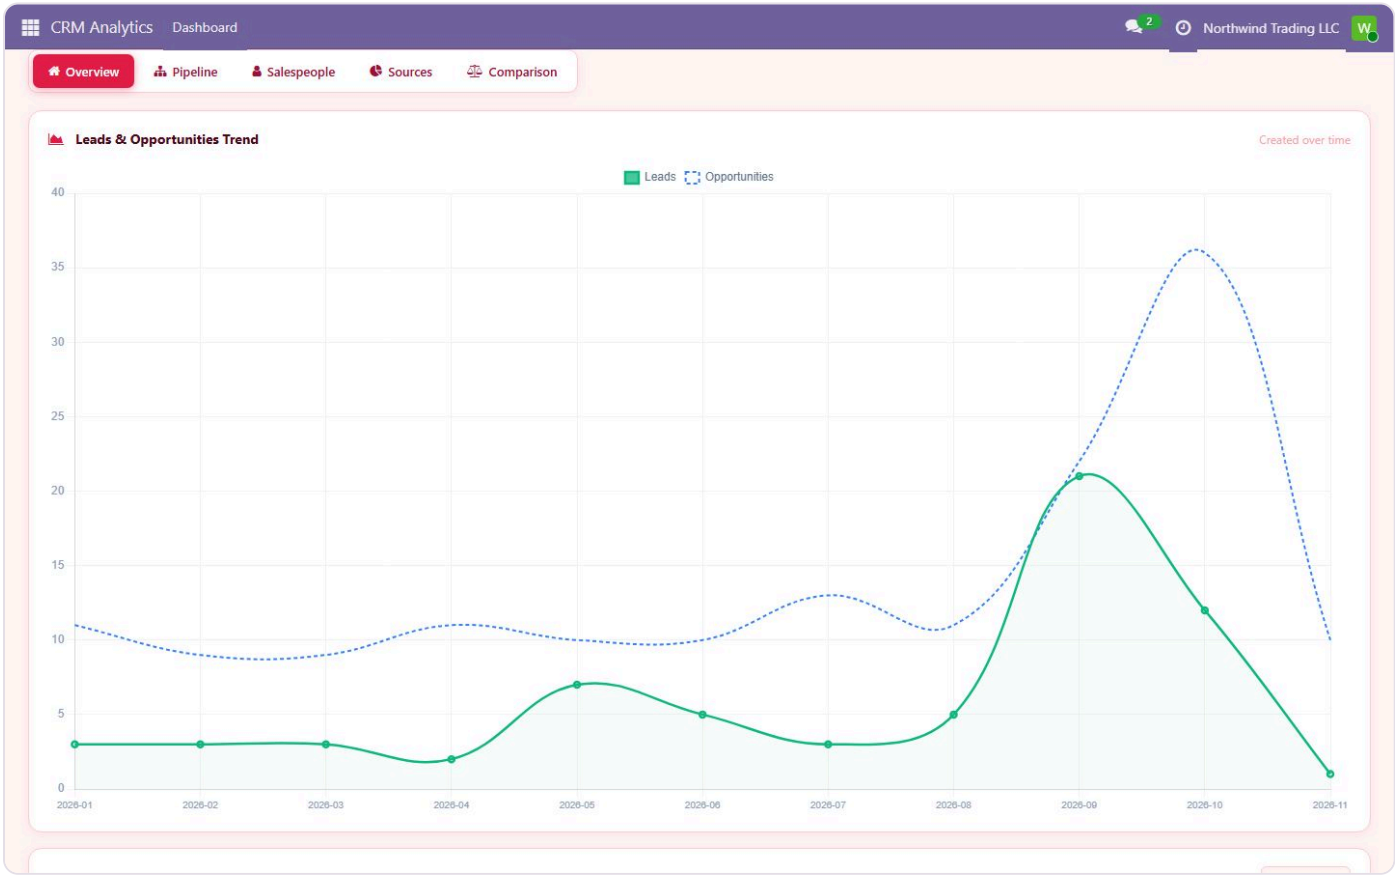

The nine cards

CARD	WHAT IT COUNTS	PERIOD?	CLICK OPENS
New Leads	Records of type lead created in the period	yes	Leads
Opportunities	Records of type opportunity created in the period	yes	Opportunities
Won Deals	Opportunities at 100% probability closed in the period, with their expected revenue	yes	Won opportunities
Lost Deals	Archived leads and opportunities last changed in the period	yes	Lost opportunities
Win Rate	Won / (won + lost)	yes	Opportunities
Avg Deal Size	Won expected revenue / number won	yes	Won opportunities
Pipeline	Open opportunities below 100%, with total expected revenue	no	Open pipeline
Team Members	Different salespeople owning an open lead or opportunity	no	Users
Overdue Activities	Open leads with at least one activity past its due date	no	Those leads

The tabs

Overview

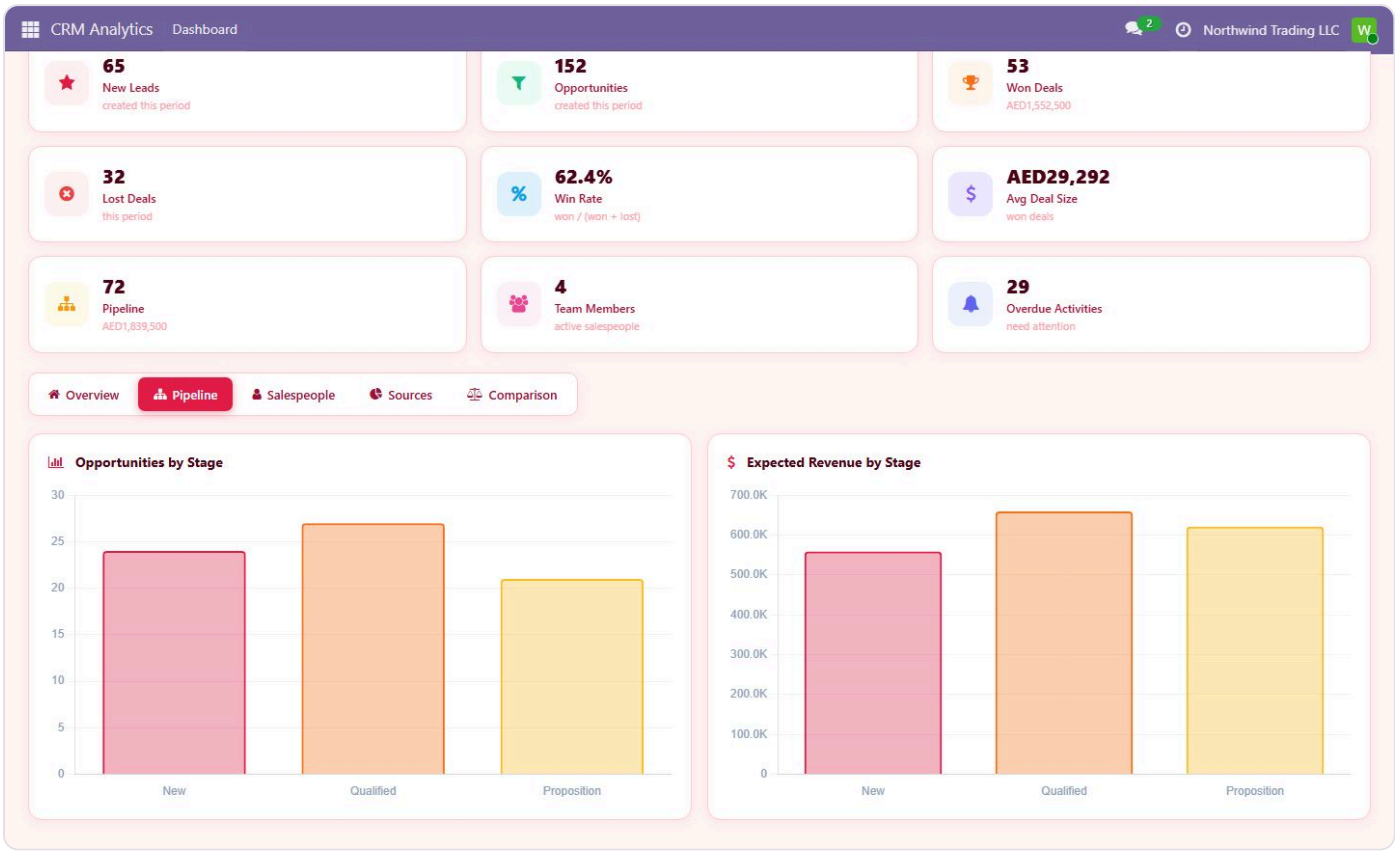

Leads and Opportunities Trend, by day up to 60 days and by month beyond, and the Recent Leads and Opportunities table with the 20 latest open records in the period, with Export CSV.

Overview: leads and opportunities created over time.

Pipeline

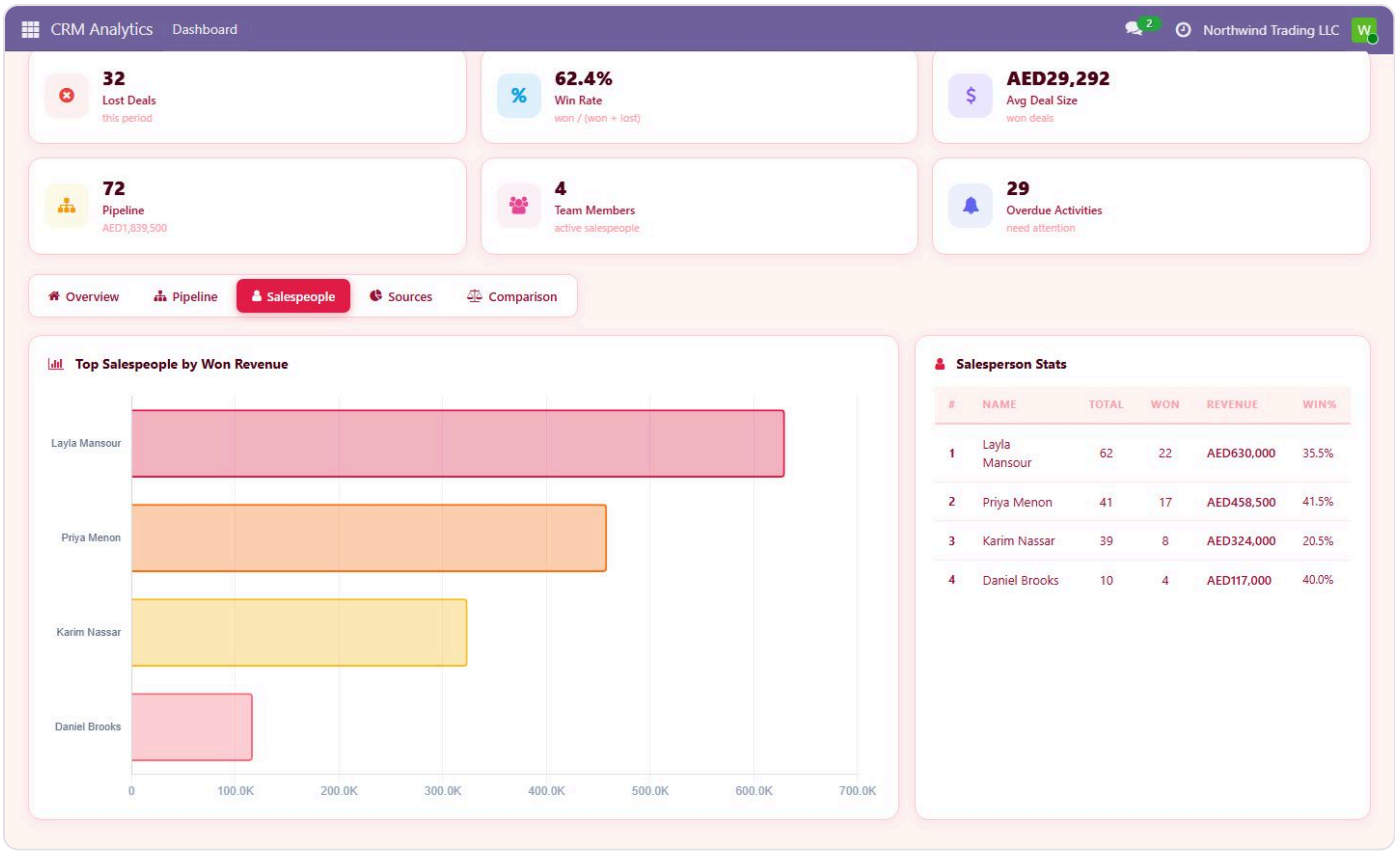

Opportunities by Stage and Expected Revenue by Stage, in stage order. These show the pipeline as it stands now.

Pipeline: count and value per stage.

Salespeople

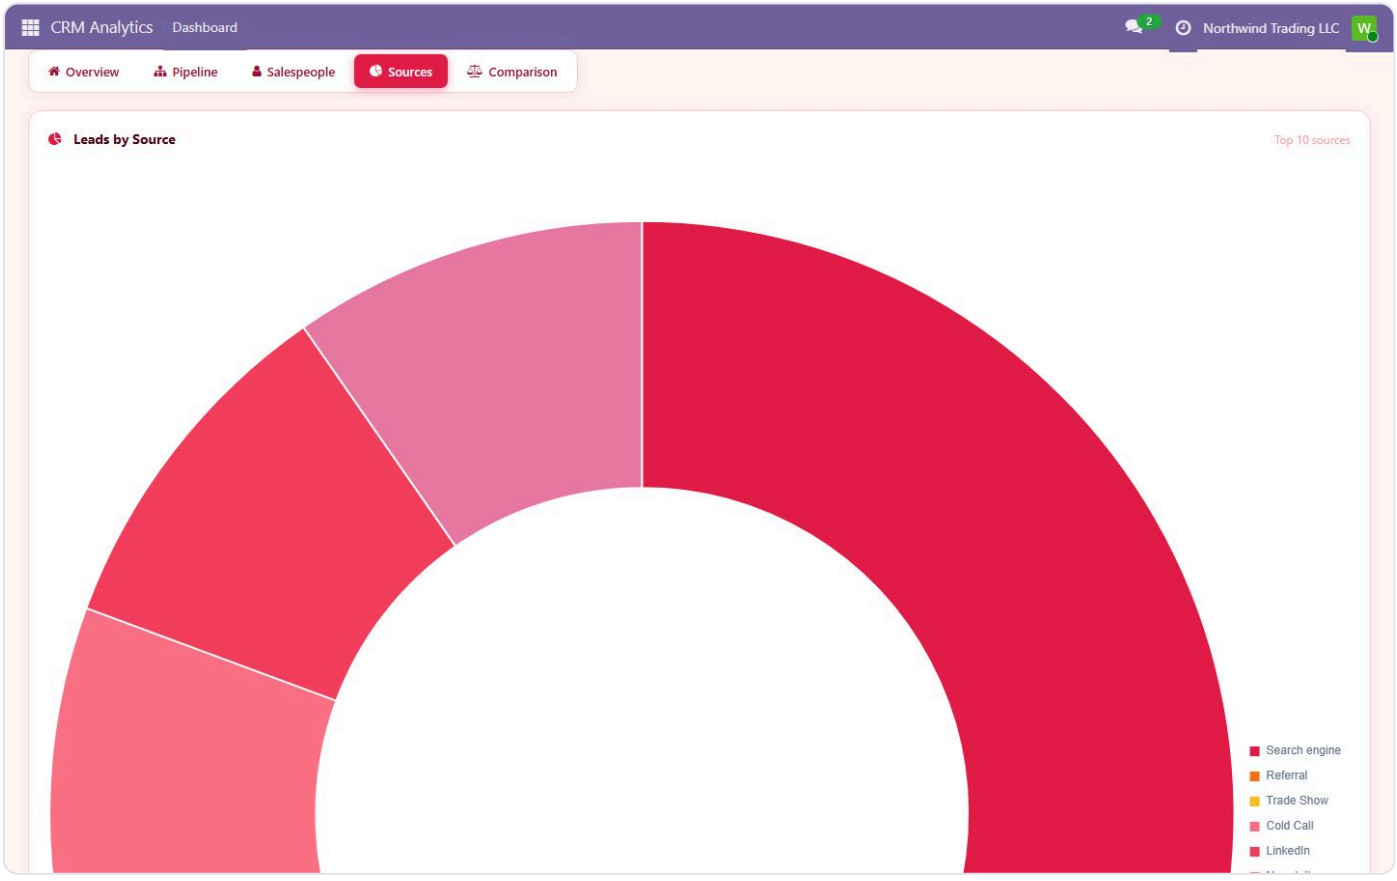

Top Salespeople by Won Revenue and a Salesperson Stats table: opportunities created in the period, won, revenue and win rate per person.

Salespeople.

Sources

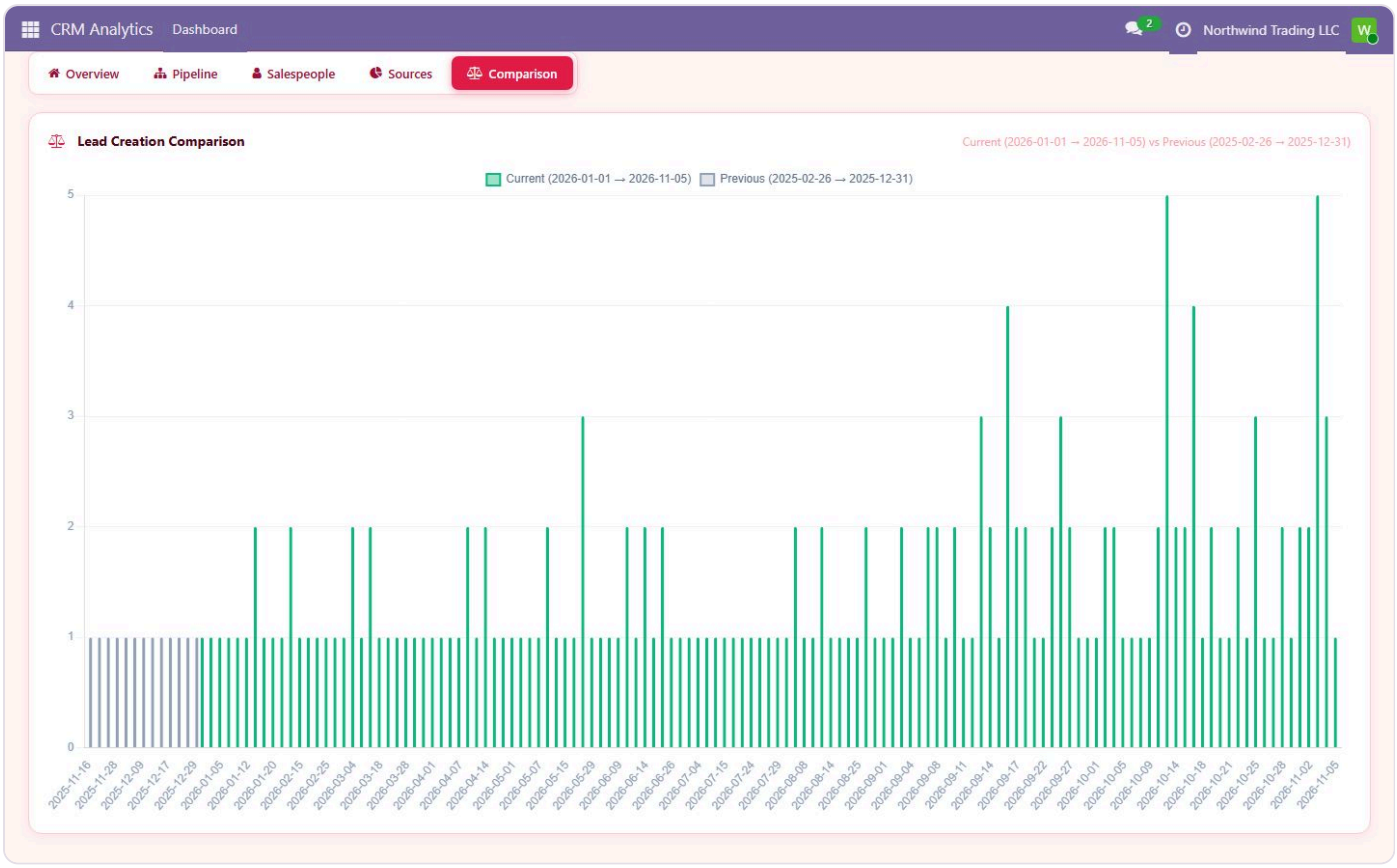

Leads by Source, from the Source field on each lead. Leads with no source are shown as Direct.

Sources: where the leads come from.

Comparison

Leads created per day in this period and the one before.

Comparison. The two periods are laid one after the other on the same axis.

Getting the figures right

1

Use Mark as Won and Mark as Lost

Mark as Won sets 100% and the closing date, which the Won card reads.

2

Set the Source

On the lead's Extra Information tab, with Campaign and Medium.

3

Schedule the next activity

Overdue Activities only helps if every open deal has one.

4

Fill Expected Revenue

Pipeline, Won and Average Deal are sums of it.

5

Company on sales teams

Leads with no company are invisible to the board.

Limits in this version

- Lost counts any archived lead edited in the period, not only lost ones, so cleaning up raises it.
- Leads with an empty company are not counted.
- The menu is open to every internal user and shows company-wide figures.
- The comparison lays the two periods side by side on one date axis instead of overlaying them.
- The listing's twelve cards, filters, funnel, won against lost trend and lost-reason analysis are not in this version.

PART 6 The Purchase dashboard

What was spent, with which vendors, on which products, what is still a request for quotation, and which vendor bills are waiting or overdue.

IN THIS PART YOU WILL LEARN

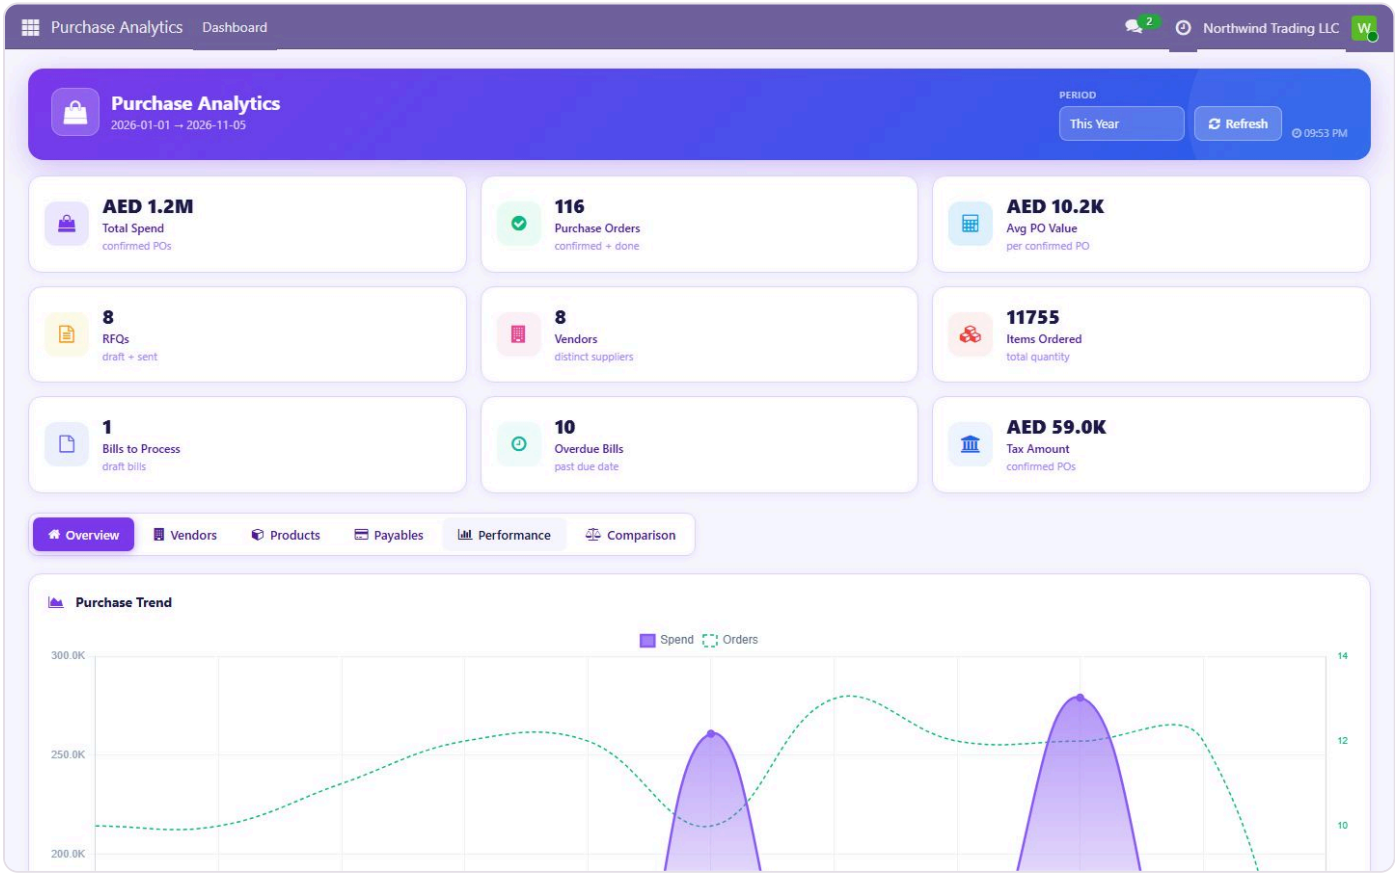

- What each of the nine purchase cards counts
- Which cards ignore the period
- Vendor and product spend
- What to set up for overdue bills to be right

TRY IT YOURSELF ON THE DEMO

1. Open Purchase Analytics on This Year
2. Open the Vendors tab and look at the share of the biggest supplier
3. Click Overdue Bills

Opening the board

Module	Purchase Dashboard (wt_purchase_dashboard, USD 20)
App tile and menu	Purchase Analytics, Dashboard
Who sees it	Purchase users and administrators
Opens on	This Month
Filters	Period (nine options and Custom Range) and the Refresh button. No vendor filter.
Counts	Purchase orders of the current company whose order date is in the period; vendor bills for two cards

The Purchase board on This Year.

The nine cards

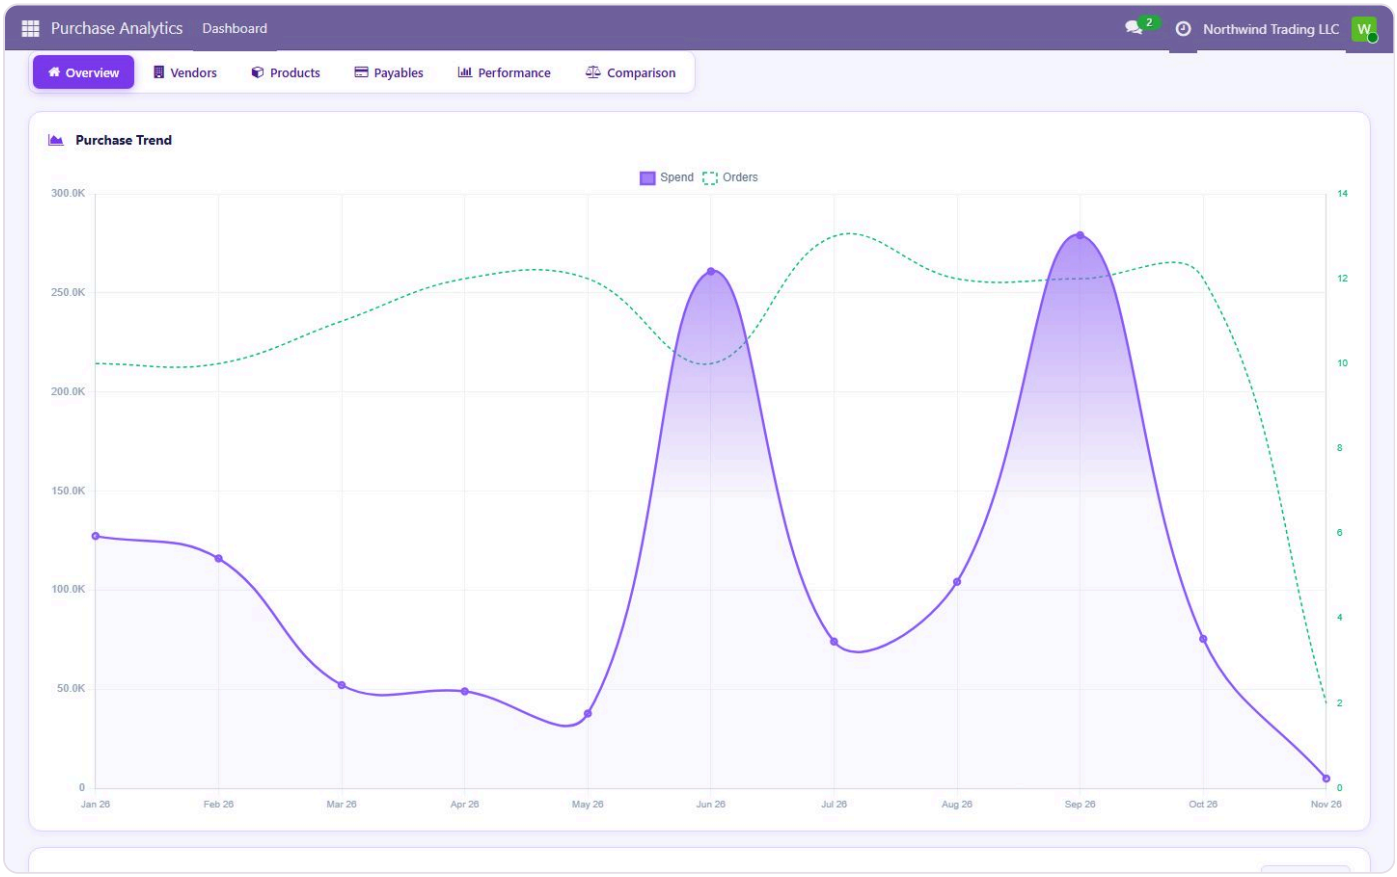

CARD	WHAT IT COUNTS	PERIOD?	CLICK OPENS
Total Spend	Untaxed total of confirmed purchase orders	yes	Those orders
Purchase Orders	Number of confirmed orders	yes	Those orders
Avg PO Value	Untaxed average per confirmed order	yes	Orders
RFQs	Requests for quotation in draft or sent	yes	Those RFQs
Vendors	Different vendors with a confirmed order	yes	Vendors
Items Ordered	Quantity on confirmed order lines	yes	Order lines
Bills to Process	Vendor bills in draft, all time	no	Draft bills
Overdue Bills	Posted vendor bills past due and not paid, all time	no	Vendor bills (wider list)
Tax Amount	Tax on confirmed orders	yes	Orders

> Orders waiting for approval (To Approve) are not counted on any card.

The tabs

Overview

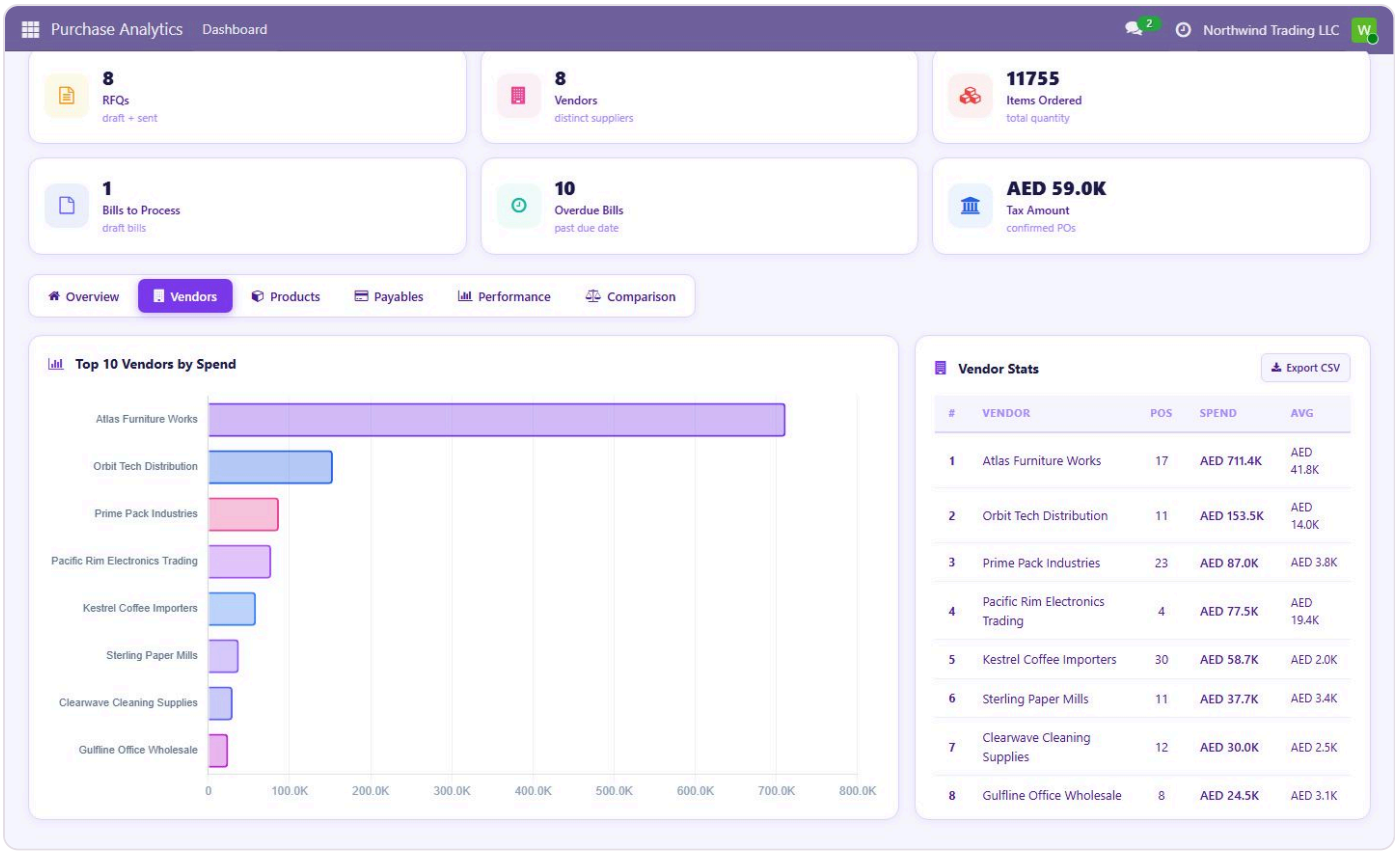

Purchase Trend, spend as a filled line and orders dashed, by day up to 90 days and by month beyond, and Recent Purchase Orders, the 20 latest in the period, with Export CSV.

Overview: spend over the year.

Vendors

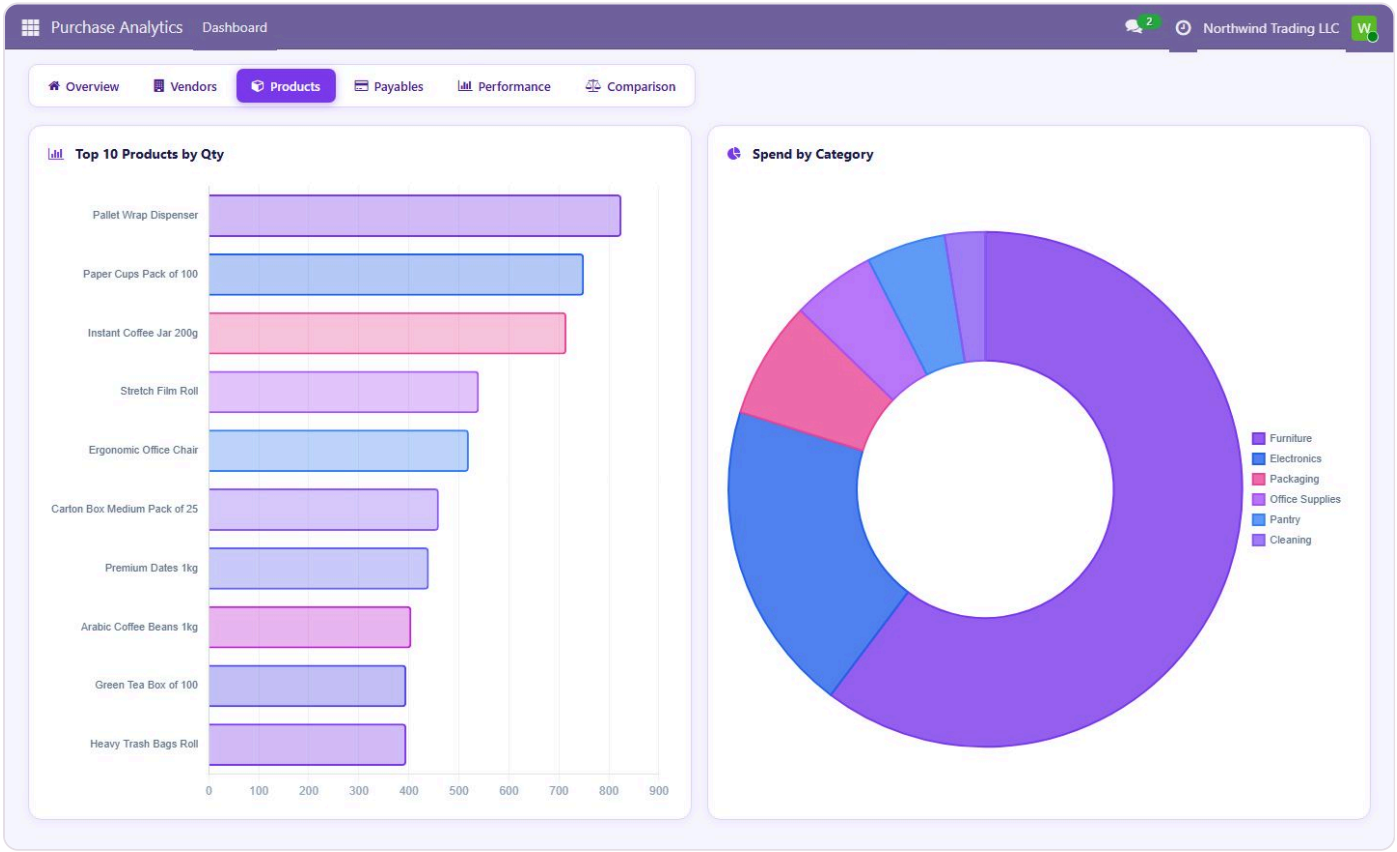

Top 10 Vendors by Spend and the Vendor Stats table with orders, spend and average per vendor, with Export CSV.

Vendors: how concentrated the spend is.

Products

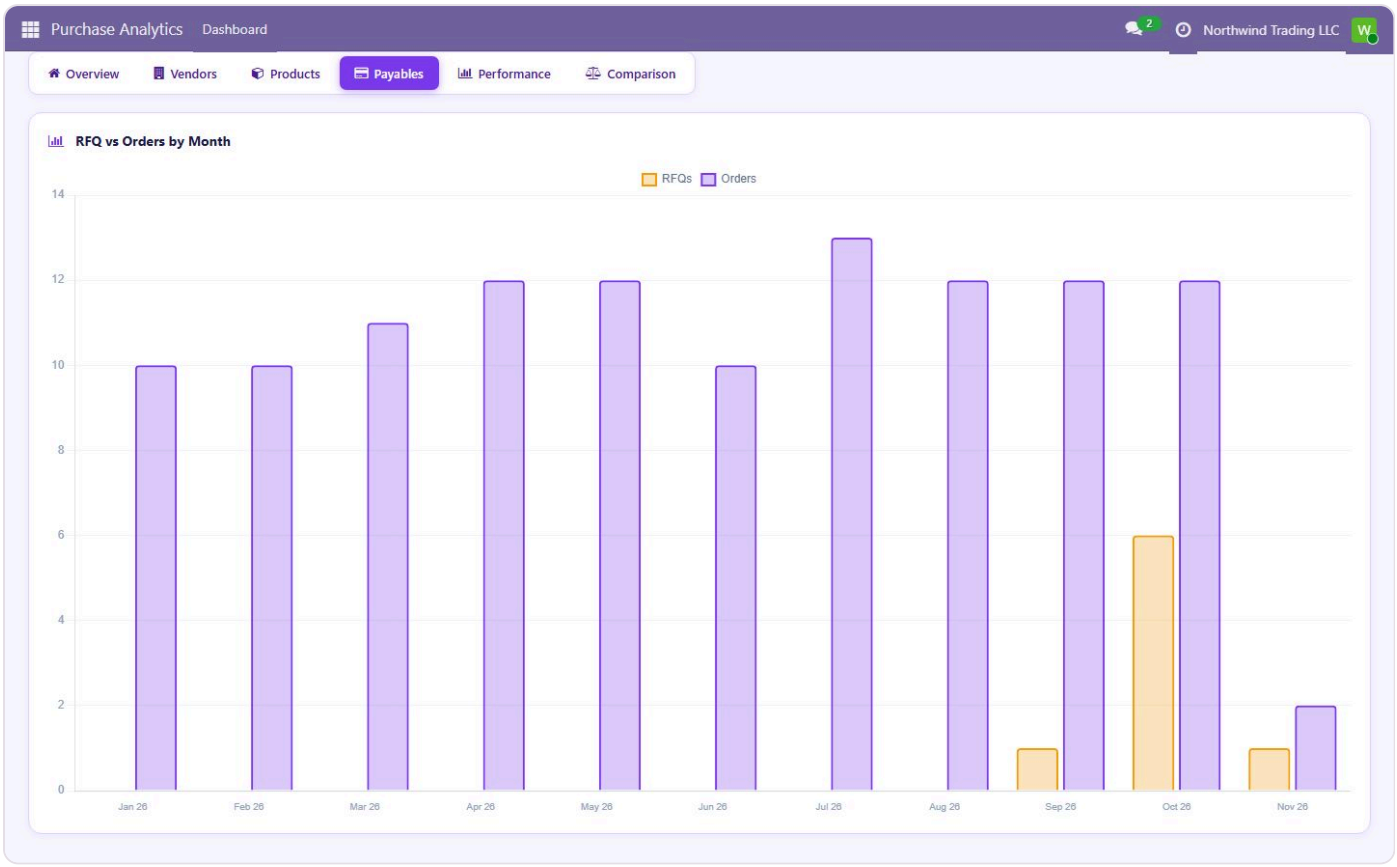

Top 10 Products by quantity ordered and Spend by Category.

Products.

Payables

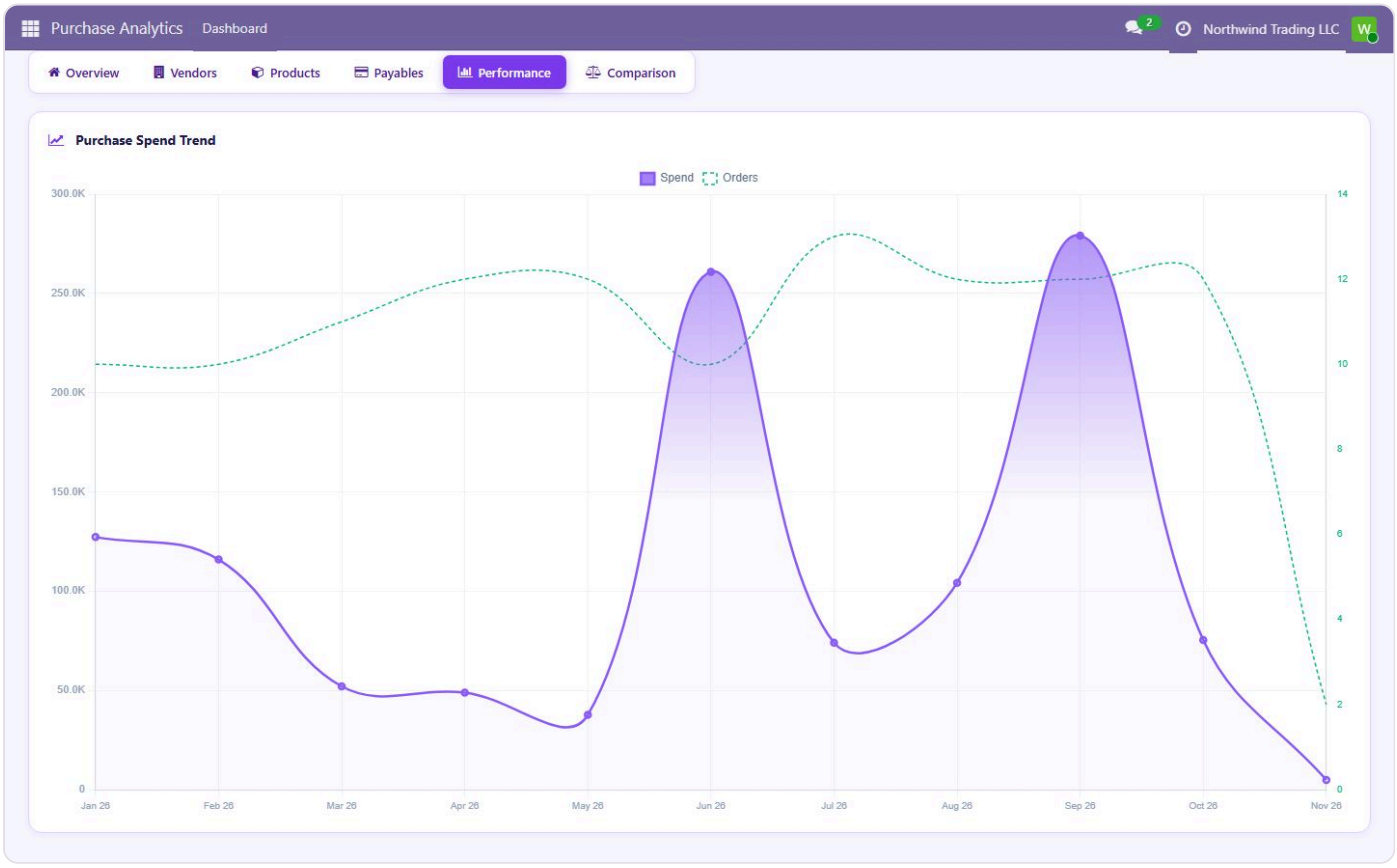

RFQs against confirmed orders by month. Despite its name, the tab shows no bills.

Payables: requests against orders.

Performance

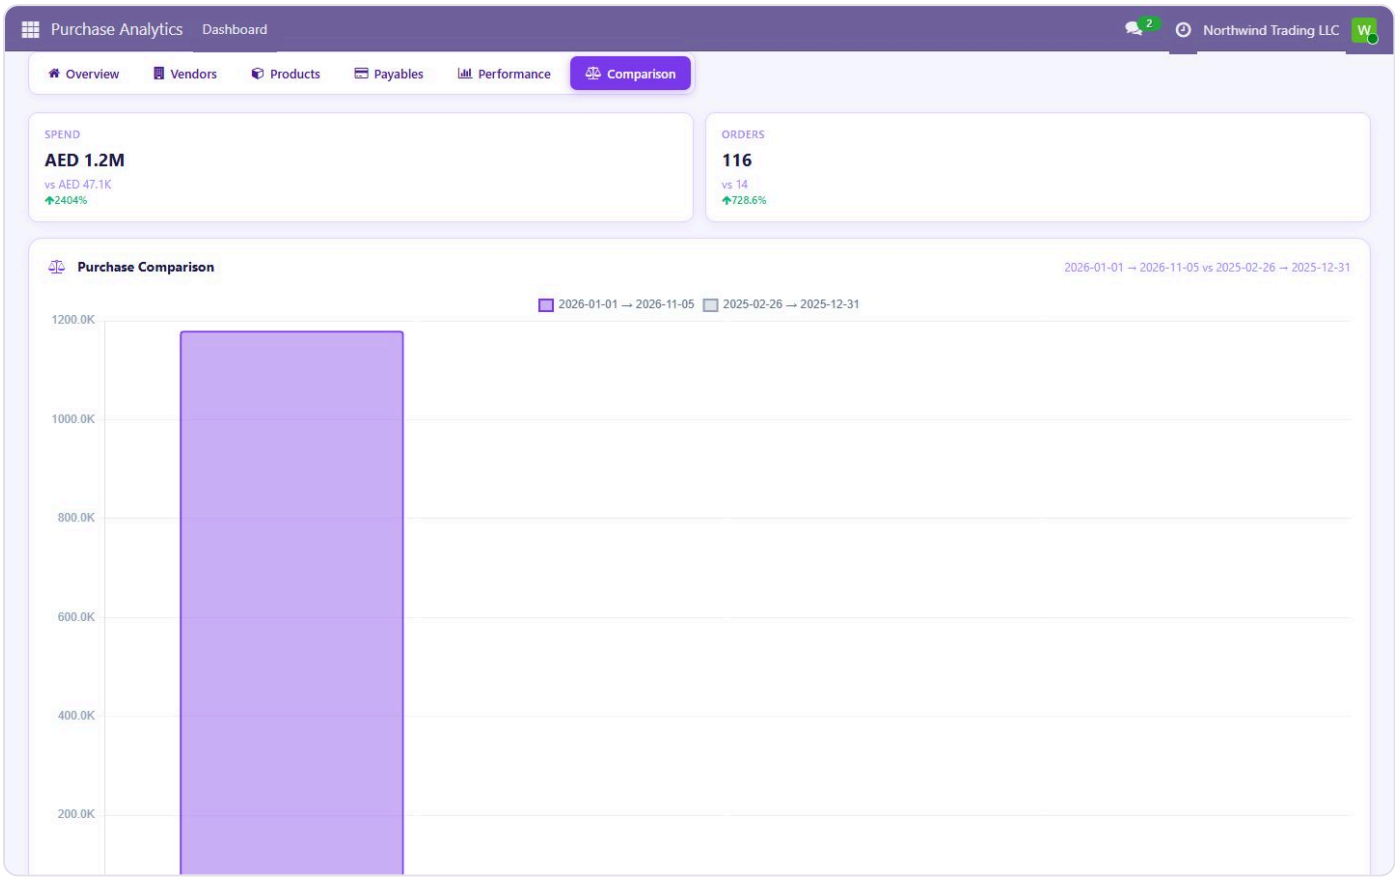

The trend chart again, on its own.

Performance.

Comparison

Spend and orders against the previous period of the same length.

Comparison. Spend and order count share one axis, so read the figures above the chart.

Getting the figures right

1

Confirm POs in Odoo

Spend lands in the month you commit it, not when goods arrive.

2

Payment terms on vendors

Each bill's due date, and so Overdue Bills, comes from them.

3

Post checked bills

Draft bills sit in Bills to Process until posted or cancelled.

4

Tidy product categories

Spend by Category is only as useful as the categories.

Limits in this version

- No vendor filter.
- Bills to Process and Overdue Bills ignore the period.
- The Overdue Bills click opens a wider list than the card counts.
- The listing's bills aging, budget line and vendor reliability are not in this version; use Part 9 for payables aging.

PART 7 The Inventory dashboard

What is on hand, what is below its reorder point, what has gone negative, and how much is waiting to come in or go out. Most cards are the warehouse as it is now.

IN THIS PART YOU WILL LEARN

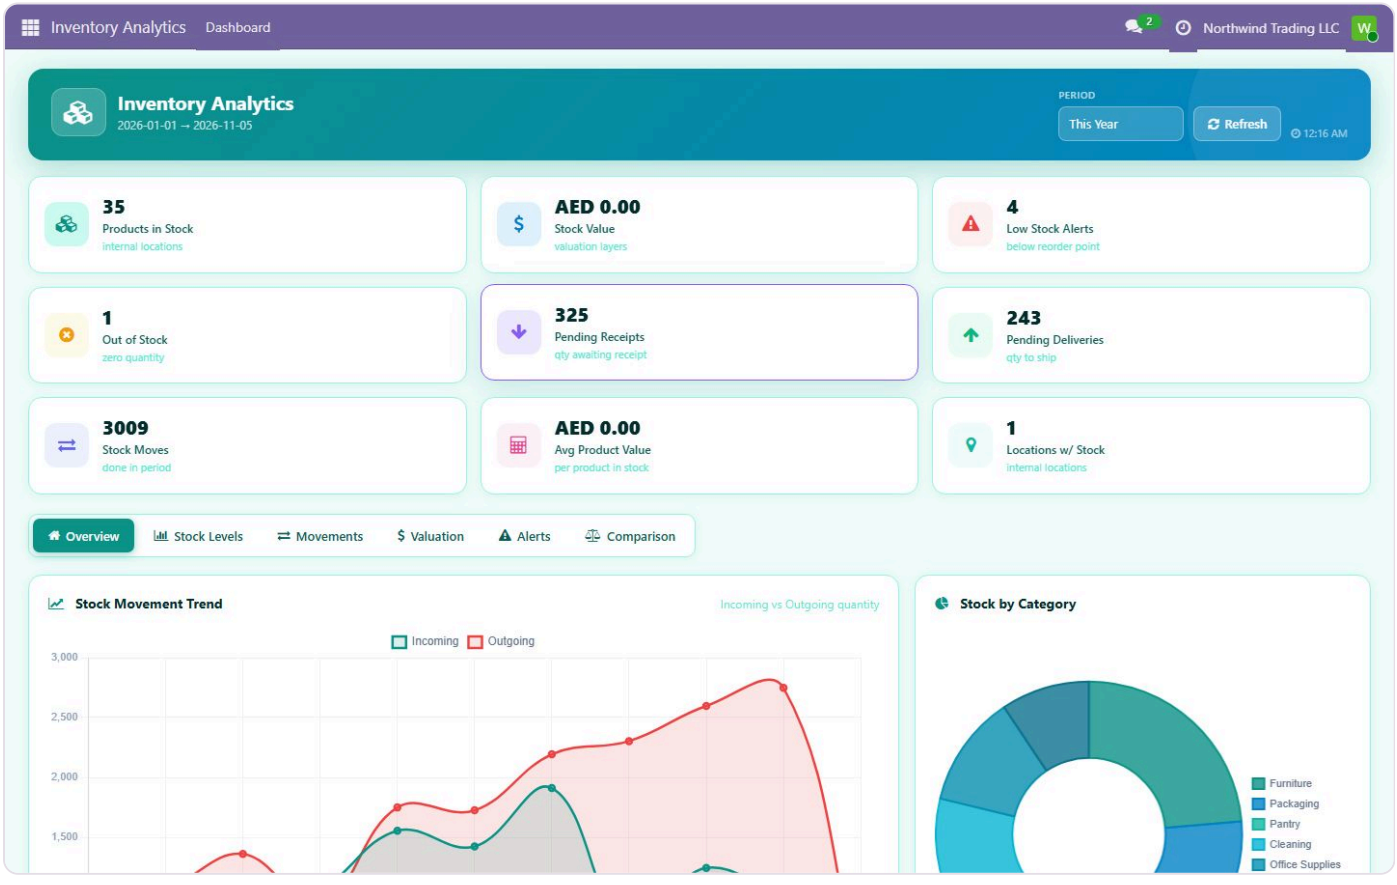

- What each of the nine stock cards counts
- How the low stock list decides a product is short
- Why stock value reads zero on Odoo 19
- How to set reorder rules for the Alerts tab

TRY IT YOURSELF ON THE DEMO

1. Open Inventory Analytics and read Low Stock Alerts
2. Open the Alerts tab
3. Click Pending Receipts

Opening the board

Module	Stock and Inventory Dashboard (wt_inventory_dashboard, USD 20)
App tile and menu	Inventory Analytics, Dashboard
Who sees it	Inventory users and administrators
Opens on	This Month
Filters	Period (nine options and Custom Range) and the Refresh button. No warehouse, location or category filter.
Counts	Quantities in internal locations and stock moves of the current company

The Inventory board. Most cards show the warehouse now.

The nine cards

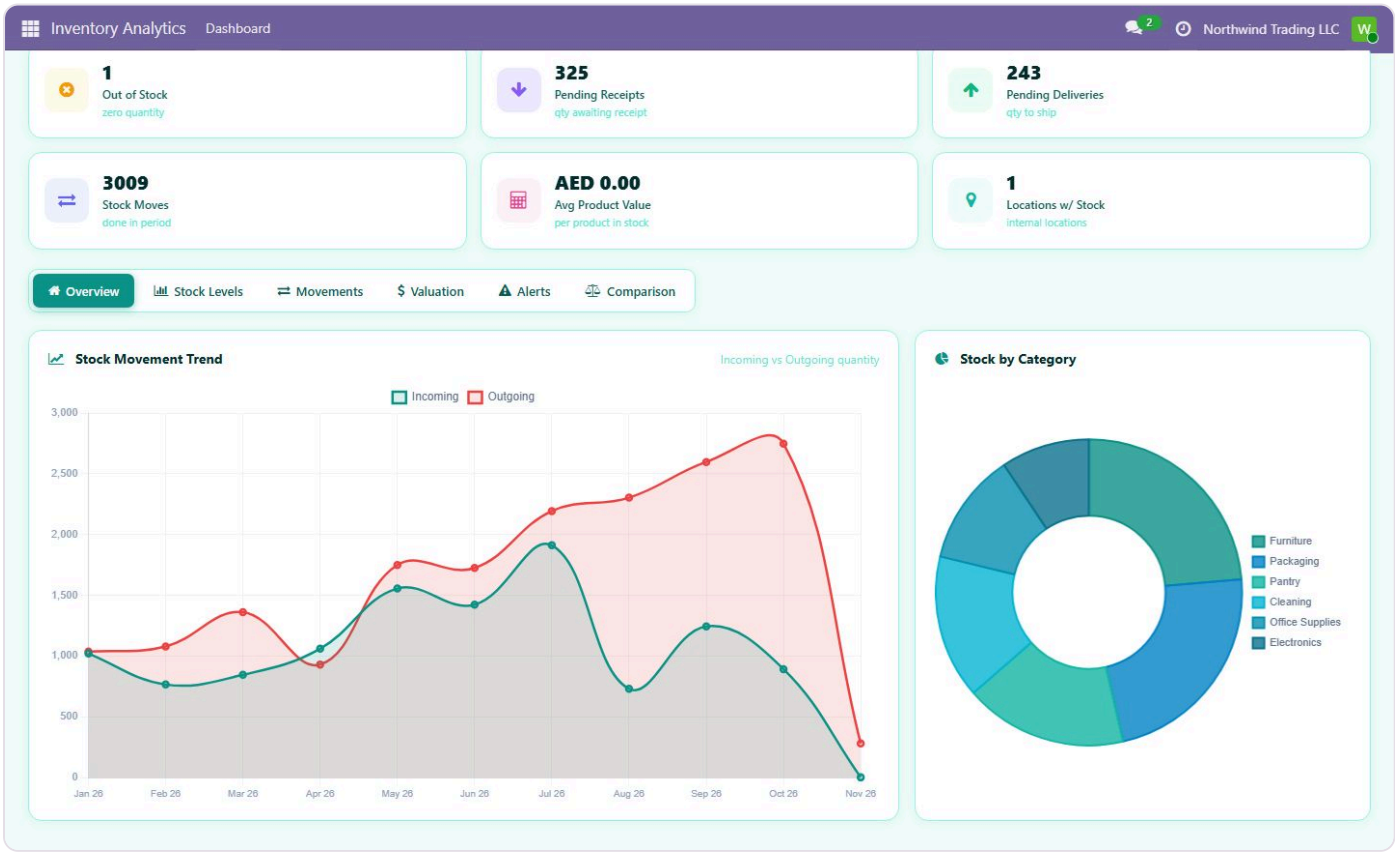

CARD	WHAT IT COUNTS	PERIOD?	CLICK OPENS
Products in Stock	Products with a positive quantity in an internal location	no	Stock
Stock Value	Reads 0 on Odoo 19 (see the note)	yes	Stock
Low Stock Alerts	Products below their reorder rule minimum at the rule location	no	Reordering rules
Out of Stock	Products with a zero or negative quantity record in an internal location	no	Stock
Pending Receipts	Units on receipts waiting or ready, not done	no	Receipts
Pending Deliveries	Units on deliveries waiting or ready, not done	no	Deliveries
Stock Moves	Moves completed in the period	yes	Moves
Avg Product Value	Reads 0 on Odoo 19	no	Stock
Locations w/ Stock	Internal locations holding stock	no	Locations

> Odoo removes empty quantity records, so Out of Stock in practice counts products that have gone negative: a delivery validated without the stock being there. Pending Receipts and Deliveries are units, not documents.

The tabs

Overview

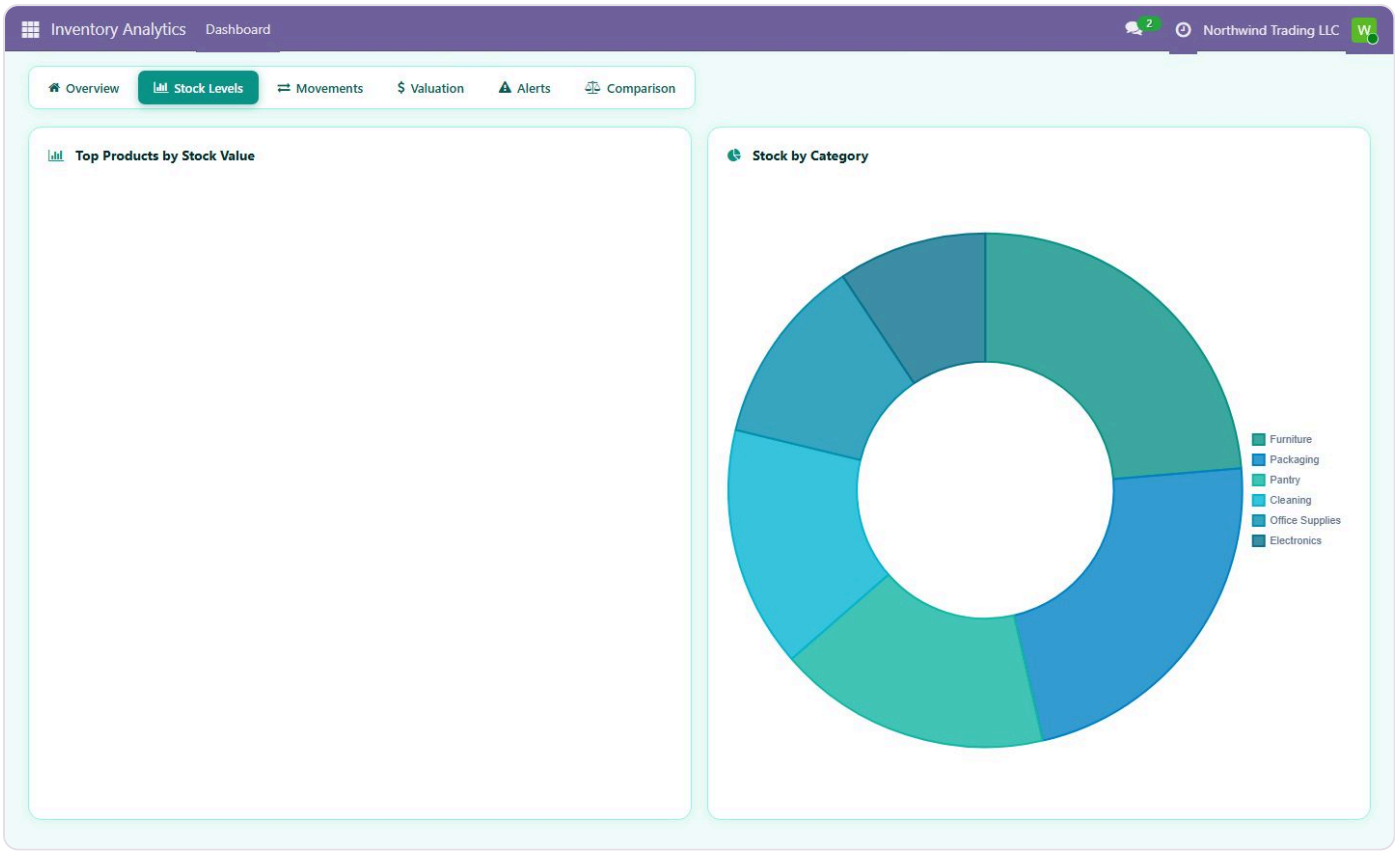

Stock Movement Trend of units received against units sent out (moves between two internal locations are not counted), by day up to 90 days and by month beyond, and Stock by Category, a doughnut of units on hand per product category.

Overview.

Stock Levels

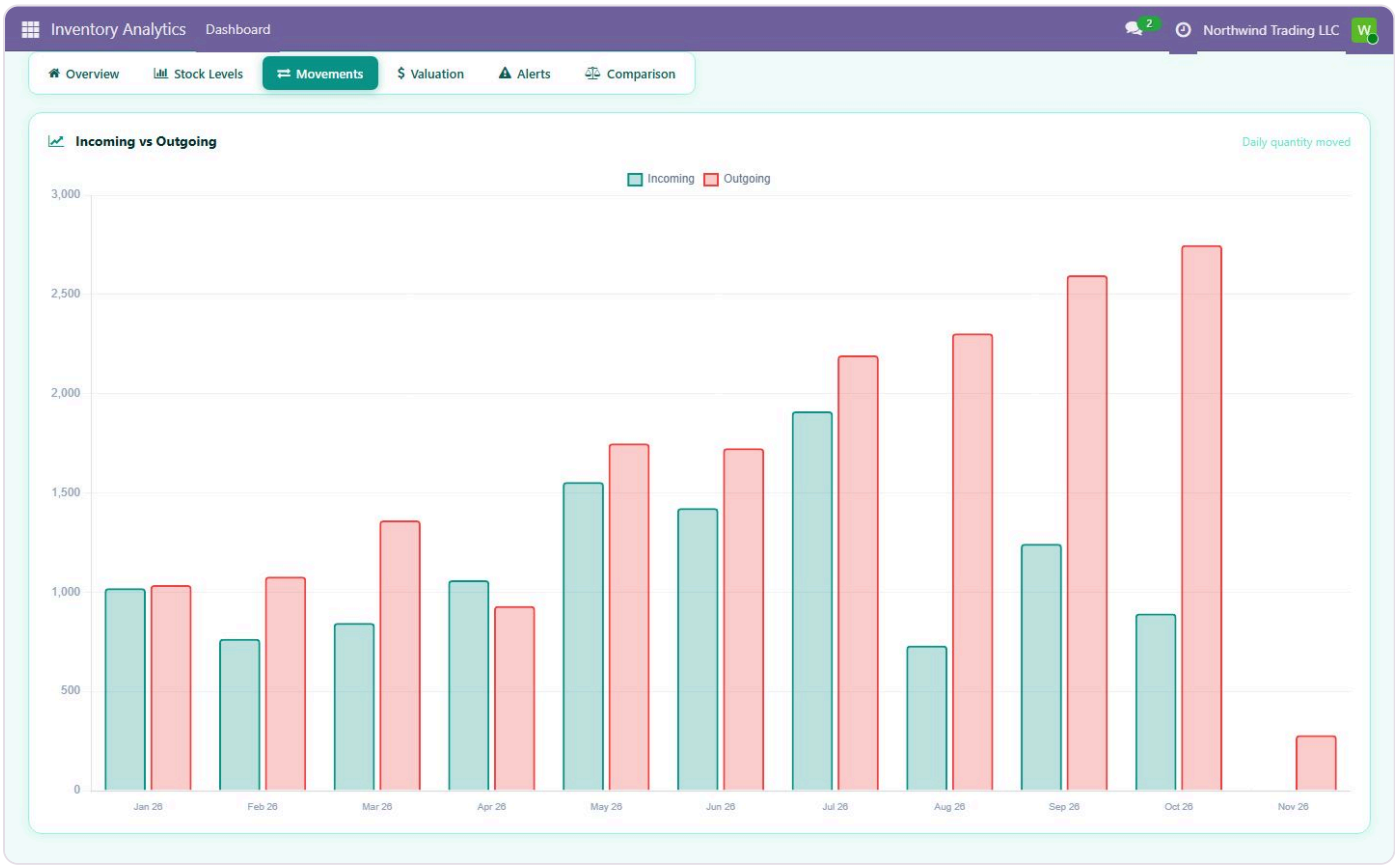

Top Products by Stock Value (empty on Odoo 19) and Stock by Category.

Stock Levels.

Movements

Incoming against outgoing units as bars.

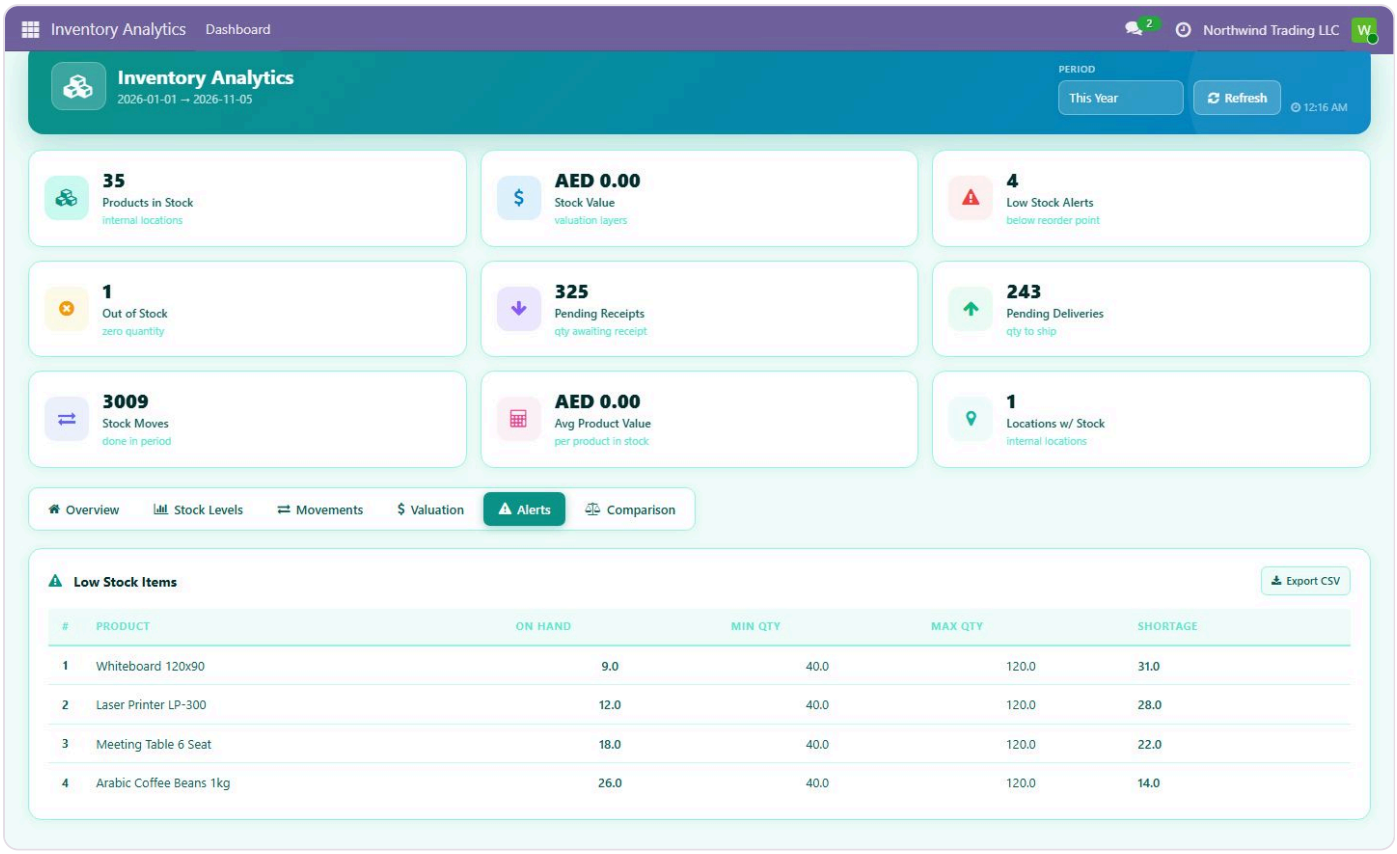

Movements.

Valuation

Top 10 Products by Value (empty on Odoo 19).

Alerts

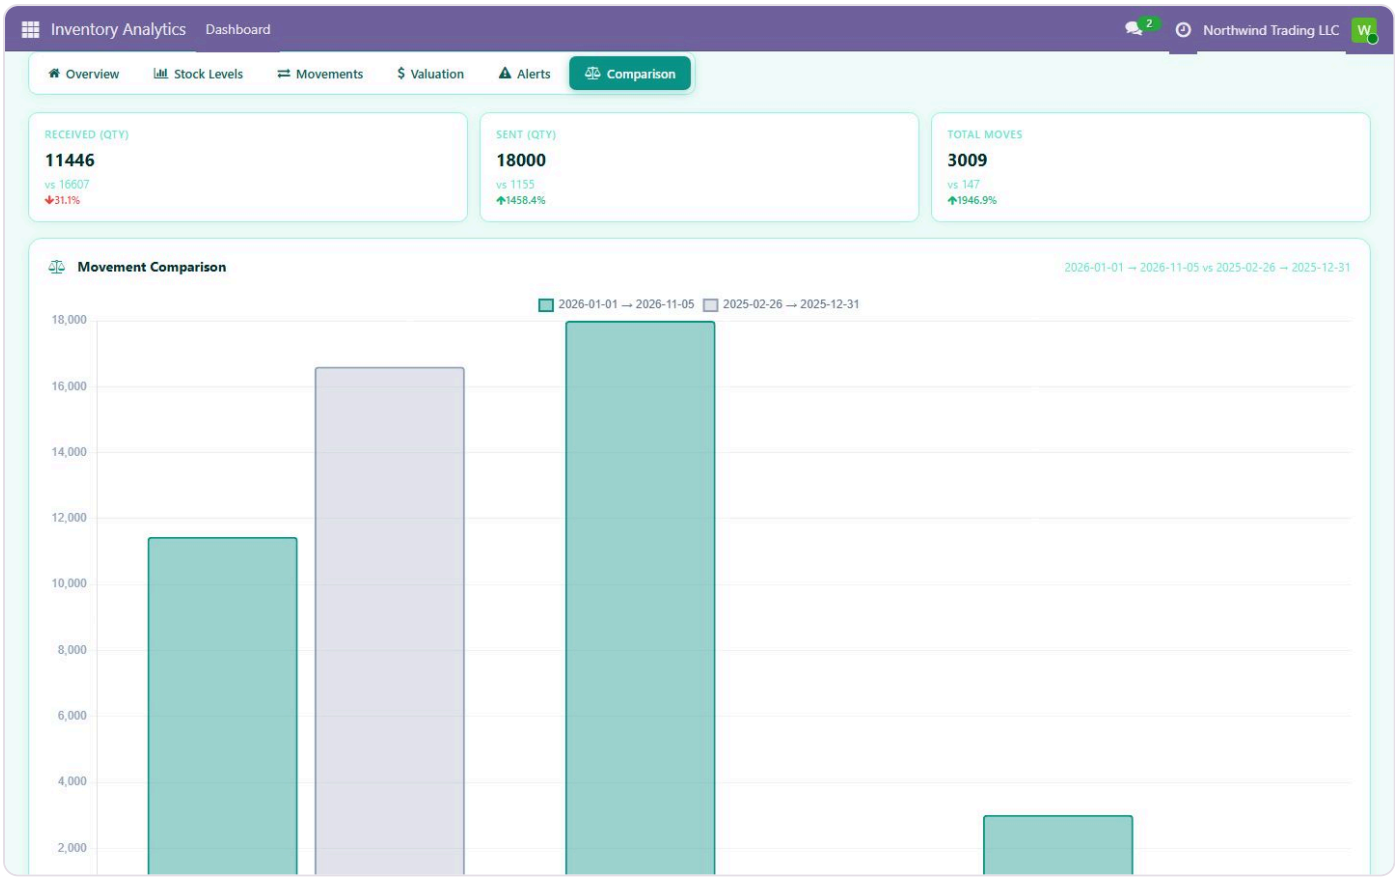

Low Stock Items: each product below its reorder minimum with on hand, minimum, maximum and shortage, with Export CSV. This is the buyer's list for the day.

Alerts.

Comparison

Units received, units sent and moves completed against the previous period.

Comparison.

Stock value on Odoo 19. Stock Value, Avg Product Value, Top Products by Stock Value and the Valuation tab read Odoo's old stock valuation layer table. Odoo 19 reworked valuation and the table no longer exists, so these are zero or empty. Even where it exists, the card adds the value of moves in the period rather than the value on hand. Take stock value from Inventory, Reporting, Stock until the module is updated.

Getting the figures right

1

Create reorder rules

Inventory, Configuration, Reordering Rules, or the product's Min/Max button.

2

Use the location you count

The board compares stock at exactly the rule's location; stock in a sub-location is not added in.

Put the rule on the sub-location if that is where the stock is.

3

Set the minimum

The shortage column is the minimum less on hand.

4

Pick the trigger

A manual trigger stops Odoo raising RFQs on its own; the list still works.

5

Delete, do not archive

Archived reorder rules are still counted in this version.

Limits in this version

- Stock value figures are zero on Odoo 19.
- No warehouse, location or category filter, although the summary says filtered by warehouse.
- Low stock uses the exact rule location only; archived rules count.
- The listing's aging, dead stock, heat map and valuation by location are not in this version.

PART 8 The POS dashboard

The tills: takings today by terminal and cashier, busy hours, how customers pay, margin and discounts, new against returning customers, open sessions and a full export.

IN THIS PART YOU WILL LEARN

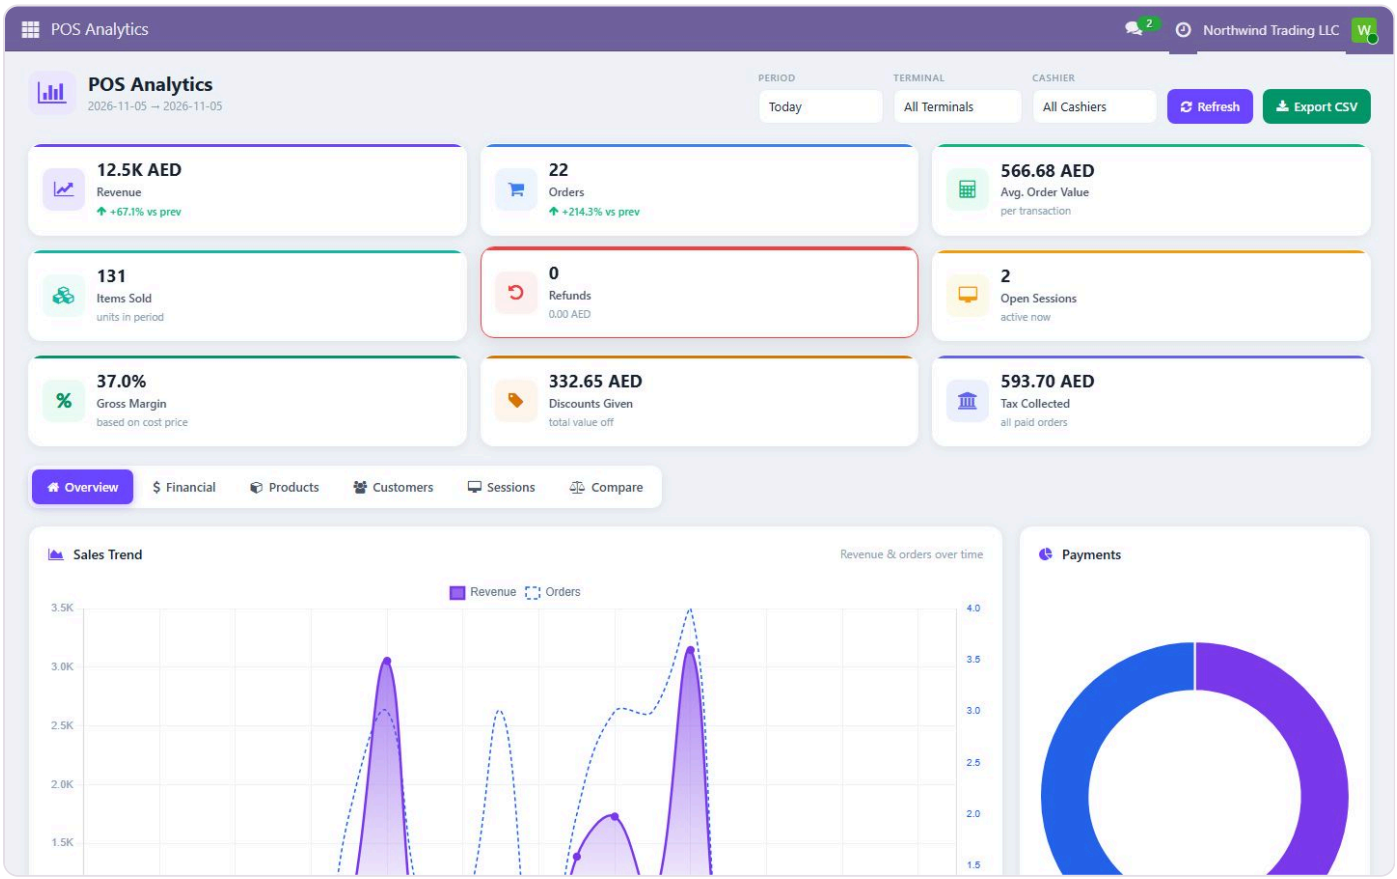

- The terminal and cashier filters
- The nine POS cards
- Busiest hours, payments and margin
- The order-line CSV export

TRY IT YOURSELF ON THE DEMO

1. Open POS Analytics: it starts on Today
2. Pick one terminal, then one cashier
3. Open the Sessions tab
4. Set This Year and open Financial

Opening the board

Module	POS Dashboard (wt_pos_dashboard, USD 20)
App tile and menu	POS Analytics (a single menu)
Who sees it	Point of Sale administrators only
Opens on	Today
Filters	Period (nine options and Custom Range) and the Refresh button, plus Terminal (All Terminals or one point of sale) and Cashier (All Cashiers or one user). Terminal and cashier apply to every figure except the Sessions tab, and to the export.
Counts	POS orders that are paid, posted or invoiced, of the current company, dated in the period

The POS board on Today, both demo counters trading.

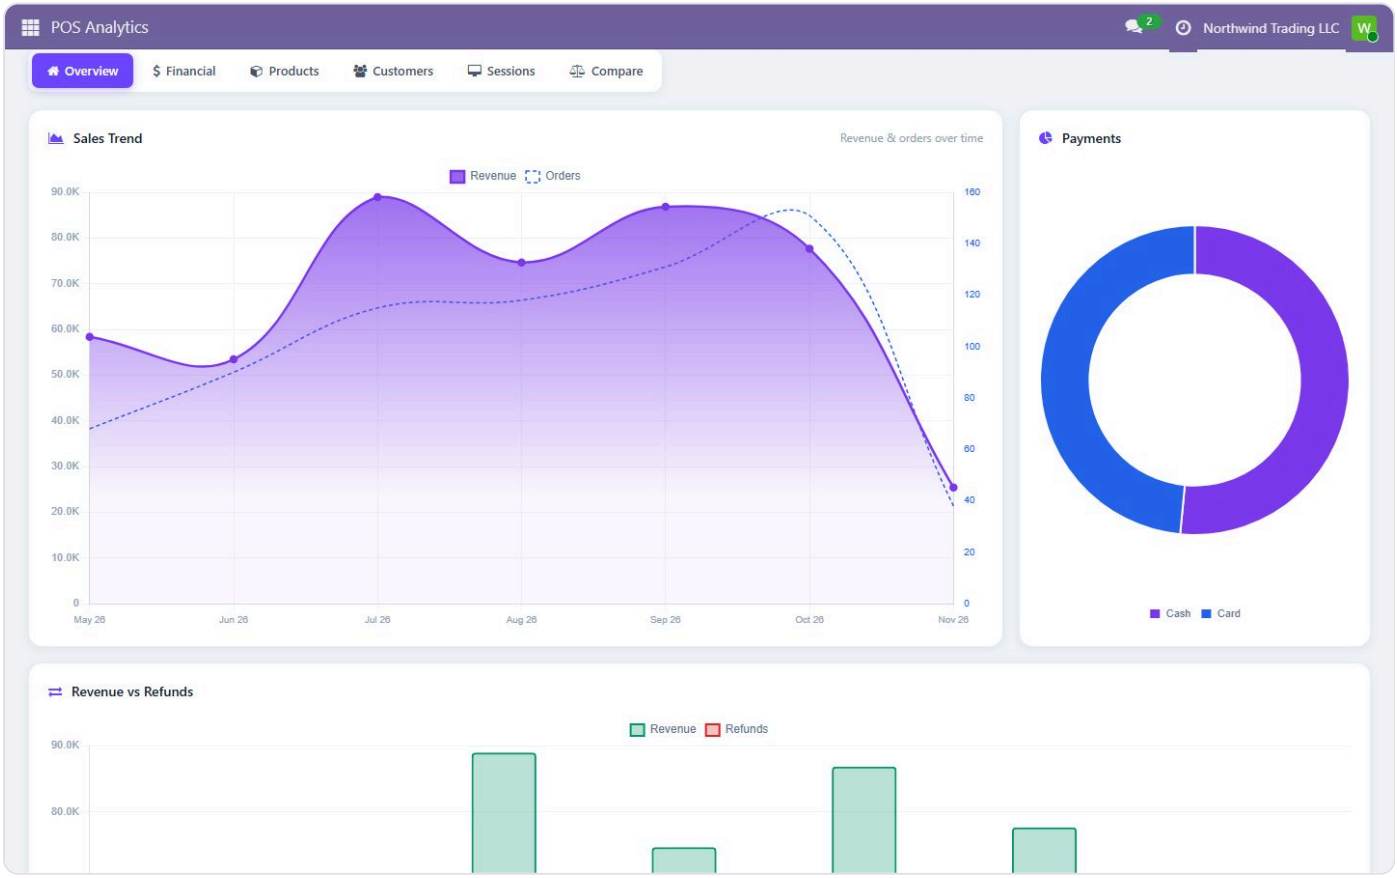

The nine cards

CARD	WHAT IT COUNTS	PERIOD?	CLICK OPENS
Revenue	Sales orders total including tax, with change against the previous period	yes	POS orders
Orders	Number of sales orders, with change against the previous period	yes	POS orders
Avg. Order Value	Revenue per order	yes	POS orders
Items Sold	Quantity on lines, net of refunds	yes	Order lines
Refunds	Number of refund orders, with the amount	yes	Refunds
Open Sessions	Sessions open right now	no	Sessions
Gross Margin %	(Line totals before tax less cost) / line totals	yes	Order lines
Discounts Given	Value of line discounts	yes	Order lines
Tax Collected	Tax on sales orders	yes	POS orders

The tabs

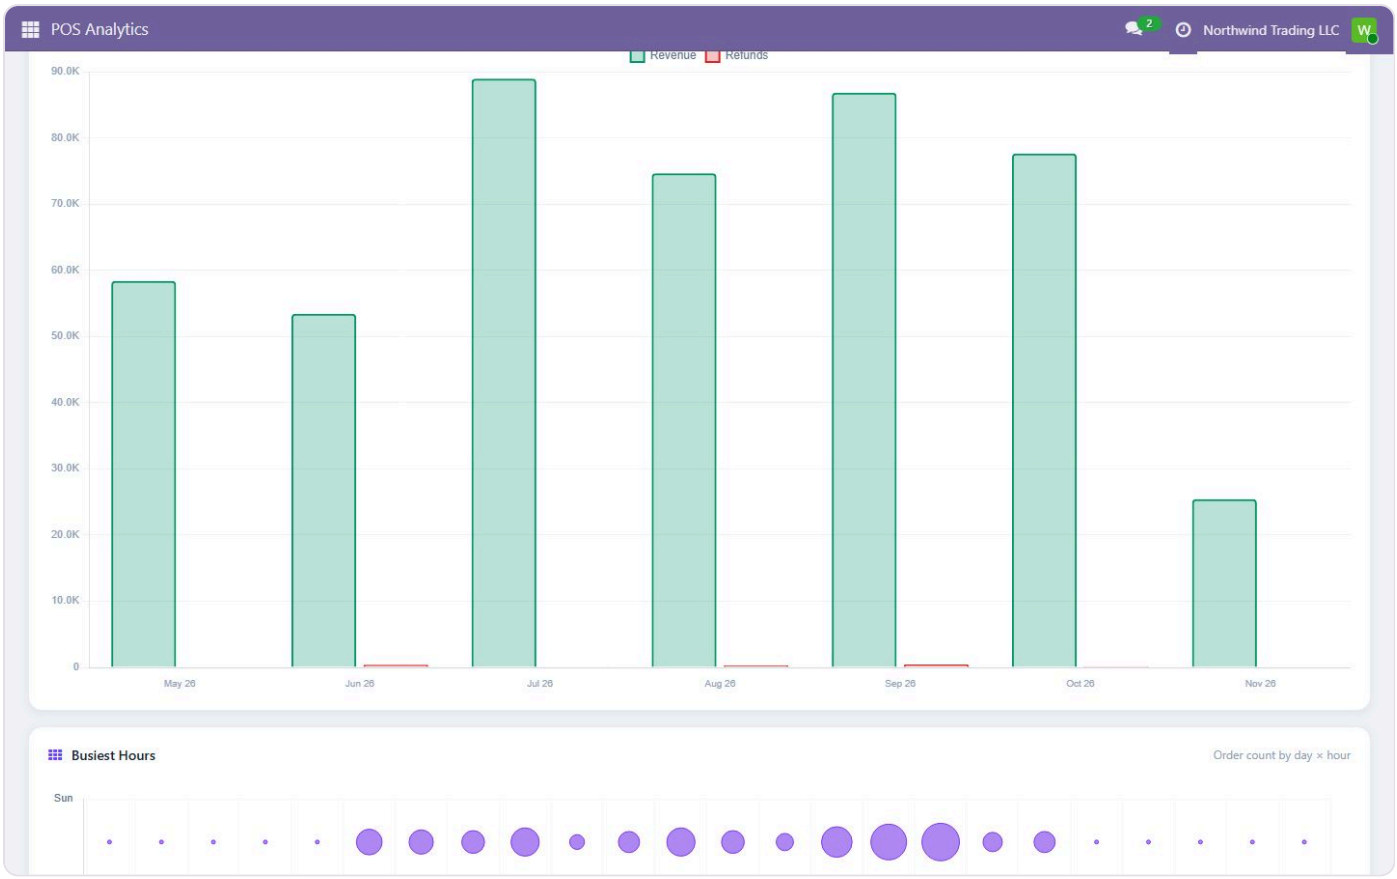

Overview

Sales Trend (by hour on a single day, by day up to 90 days, by month beyond), Payments by method, Revenue vs Refunds, Busiest Hours (orders by weekday and hour), Recent Orders (20) and a Salesperson table.

Overview on Today.

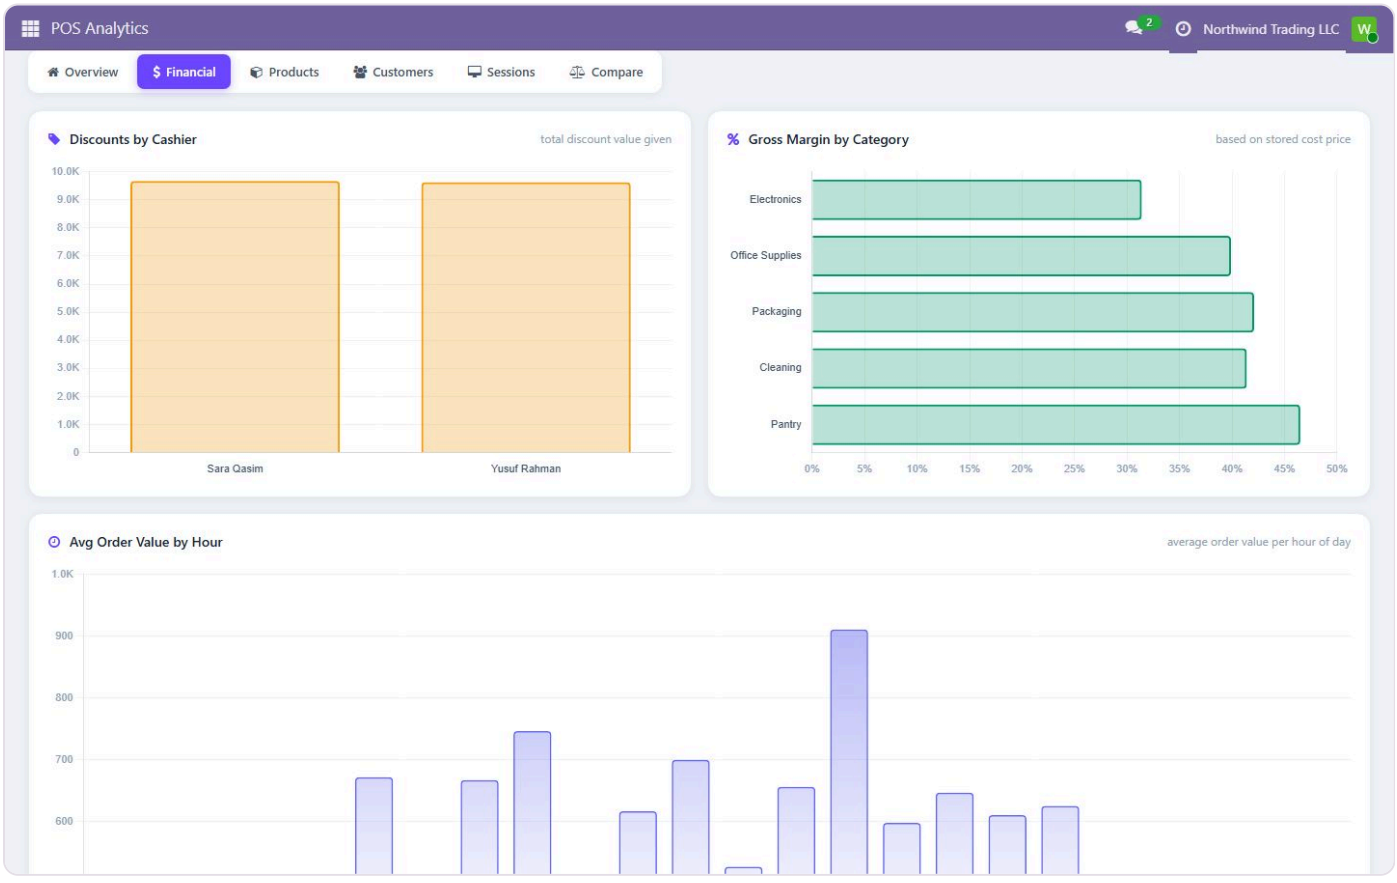

Lower on the Overview, here on This Year: revenue against refunds by month, then Busiest Hours, one bubble per weekday and hour, larger for more orders.

Revenue vs Refunds and Busiest Hours.

Financial

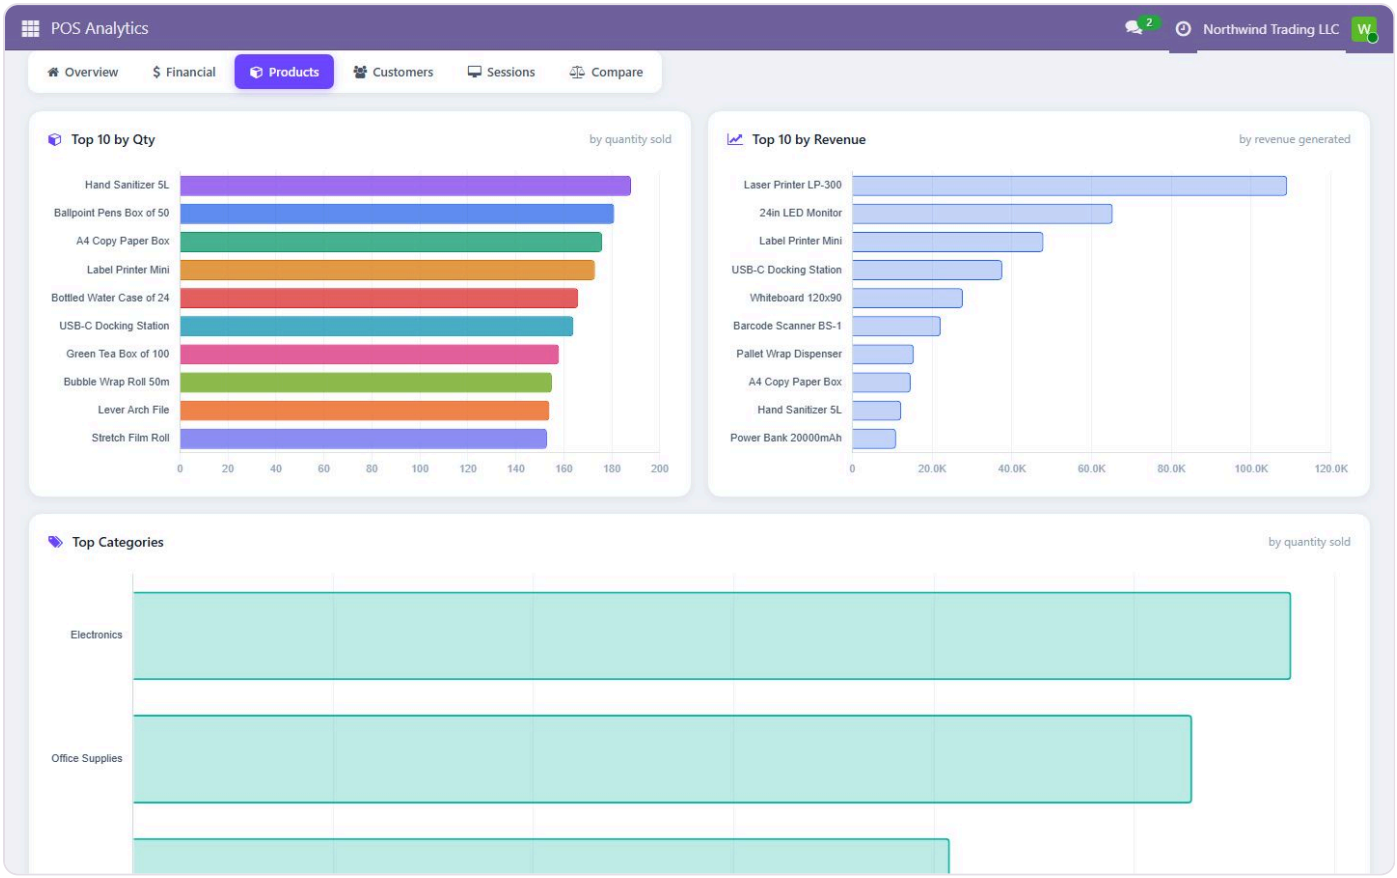

Discounts by Cashier, Gross Margin by Category, Average Order Value by Hour and a table of the most discounted products.

Financial.

Products

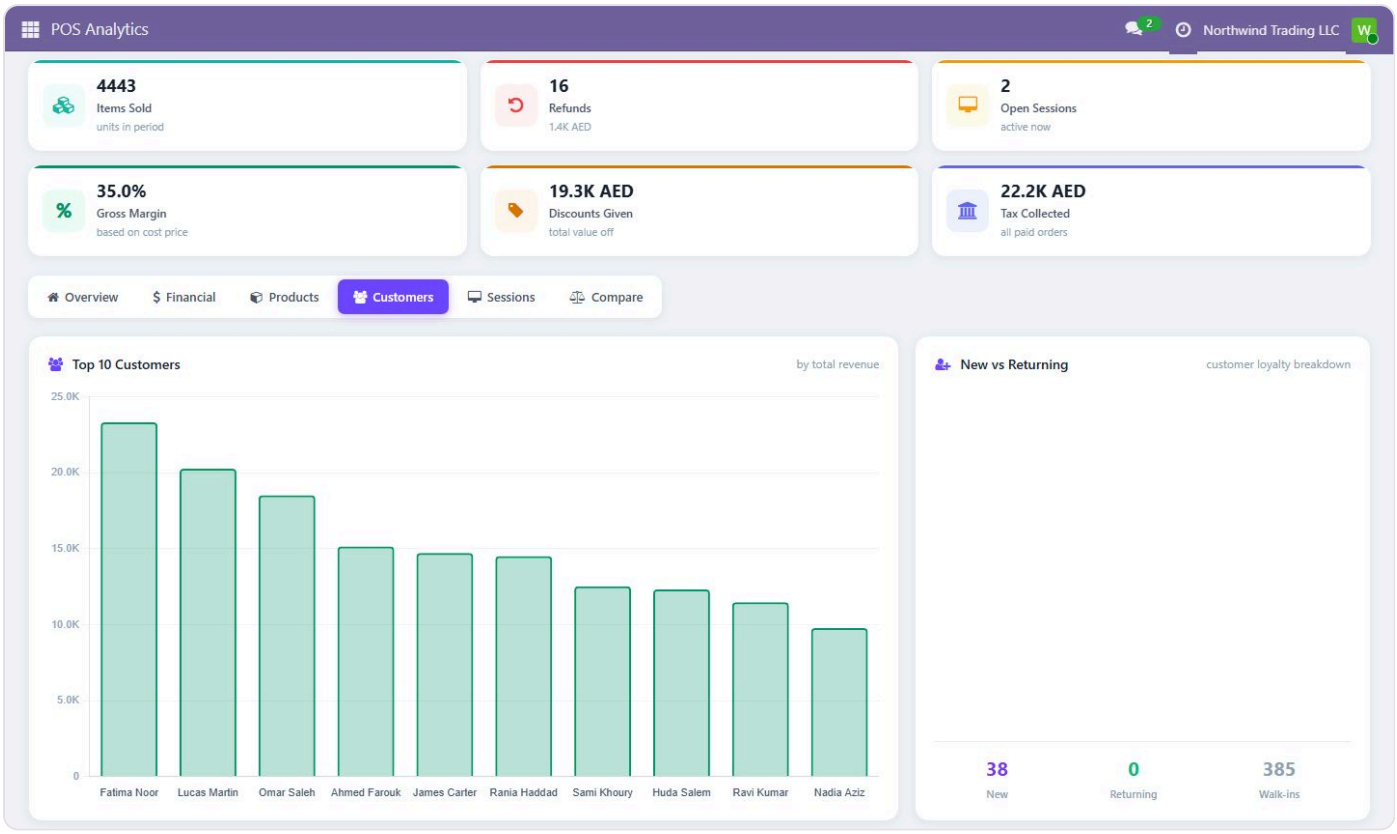

Top 10 by quantity, top 10 by revenue (with tax) and Top Categories, using POS categories and falling back to the product category.

Products.

Customers

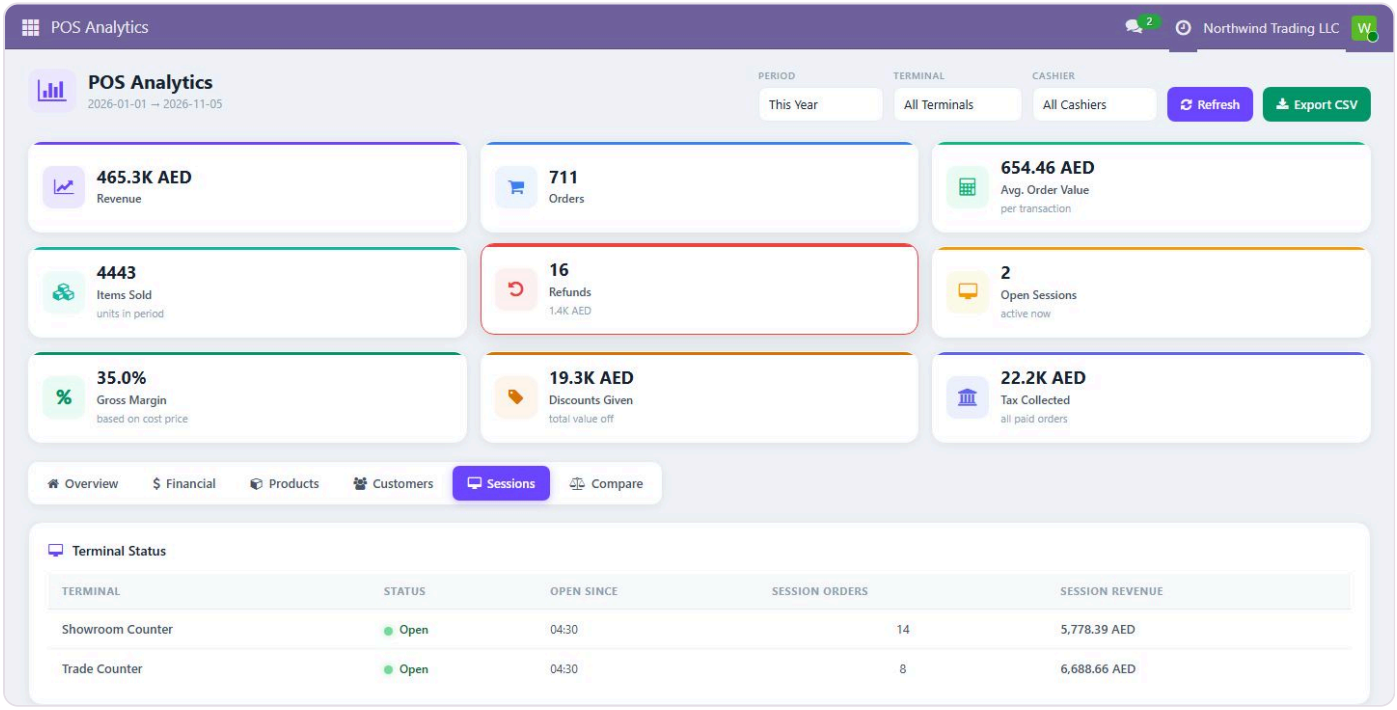

Top 10 Customers and New vs Returning: new if the customer's first ever POS order is in the period, returning if they bought before, walk-in if the order has no customer.

Customers.

Sessions

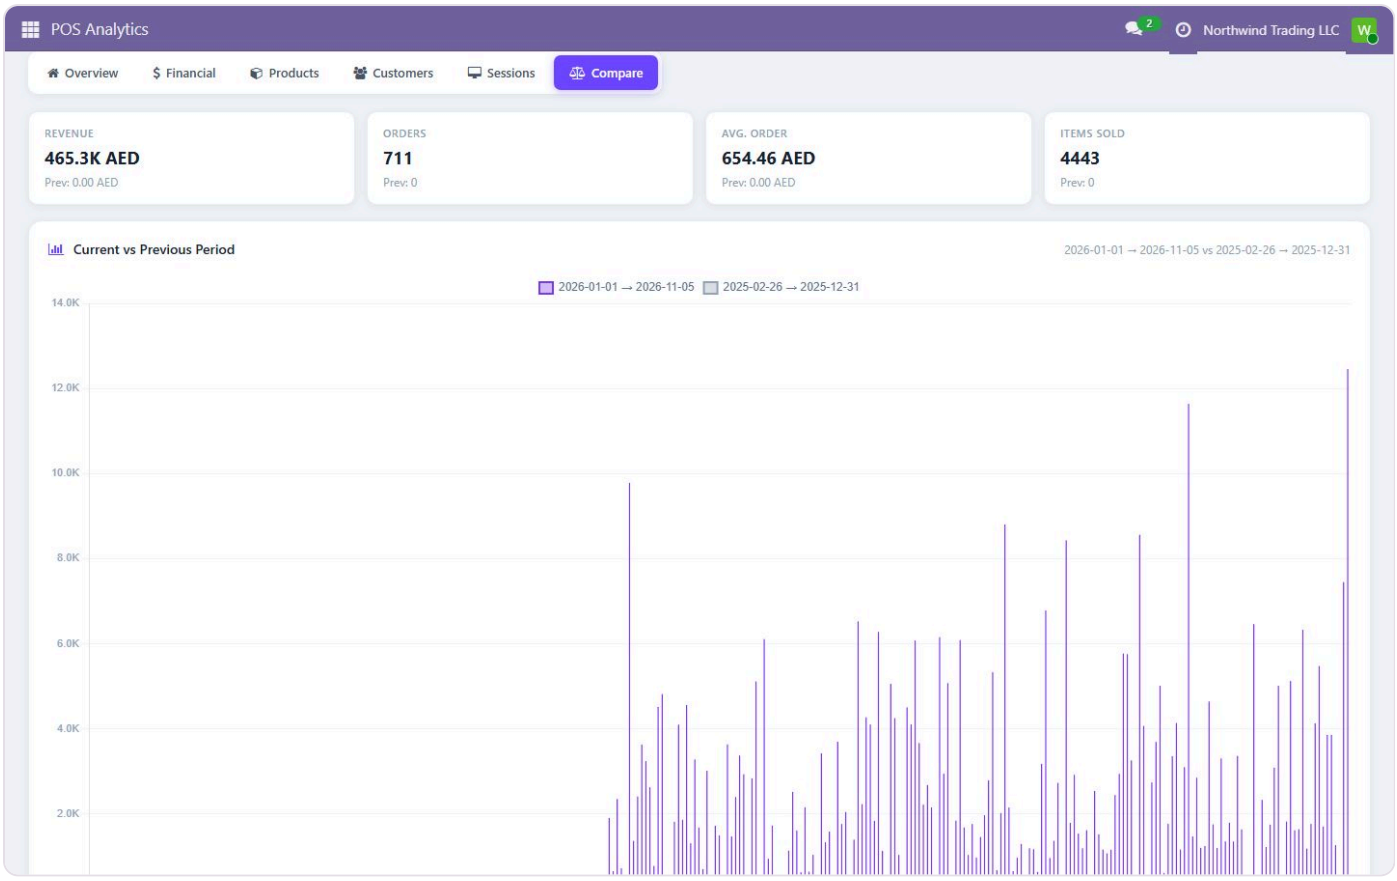

Terminal Status: every point of sale with its open session, the session's revenue and orders and when it opened.

Sessions: every till at a glance.

Compare

Revenue, orders, average order and items sold against the previous period, with a chart of both periods.

Compare.

The CSV export

The **Export CSV** button in the header downloads every order line in the period for the selected terminal and cashier, up to 50,000 lines, ready for Excel. Columns: order reference, date, cashier, terminal, customer, product, category, quantity, unit price, discount percent, discount amount, price before tax, price after tax and order state. All states are included, so filter out cancelled orders before totalling. There is no payment method column.

Getting the figures right

1

A cost on every product

Margin uses the cost saved on each line.

2

One Odoo user per cashier

With the shared employee login every order carries one user and the cashier filter cannot tell staff apart.

3

POS categories

For Top Categories and Margin by Category.

4

Customer on account sales

Walk-in orders count in revenue but not in the customer charts.

5

Close sessions daily

Open Sessions is a live count.

Limits in this version

- Hours are in server time (UTC): in Dubai the 1 pm rush shows at 9 am.
- A product in two POS categories counts in both category charts.
- Revenue includes tax while margin is before tax.
- Only Revenue and Orders show a change on the card; the CSV has no payment method or tax column.

PART 9 The Accounting dashboard

Invoiced revenue against vendor bills, what customers owe and how old it is, what you owe suppliers, and the invoices that are late. Every figure comes from posted invoices and bills.

IN THIS PART YOU WILL LEARN

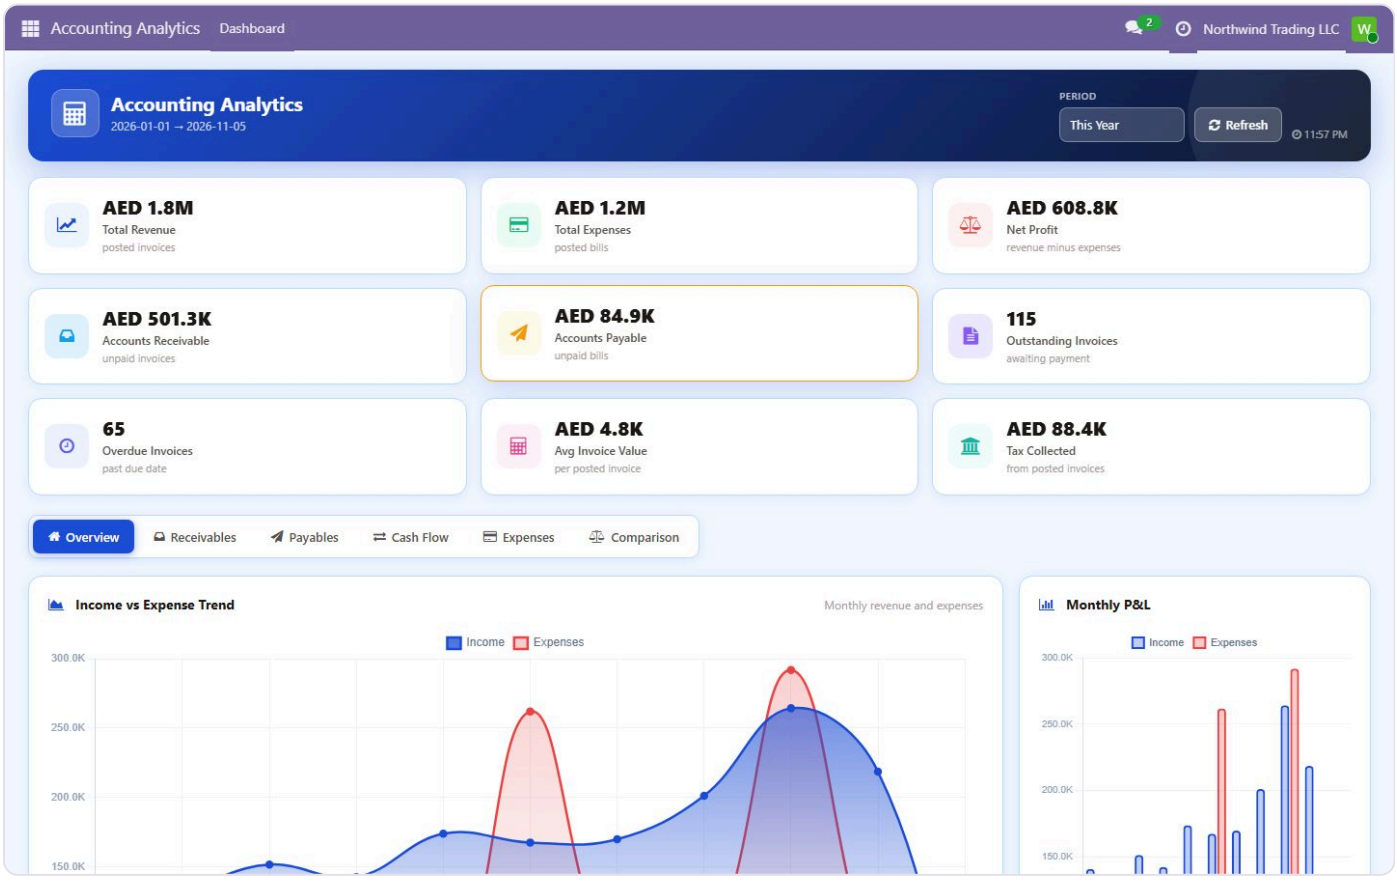

- Which cards follow the period and which are today's position
- The aging buckets
- What Net Profit is and is not
- Who can open the board

TRY IT YOURSELF ON THE DEMO

1. Open Accounting Analytics on This Year
2. Open Receivables and read the buckets
3. Click Overdue Invoices

Opening the board

Module	Accounting Dashboard (wt_accounting_dashboard, USD 20)
App tile and menu	Accounting Analytics, Dashboard
Who sees it	Billing Administrator (accounting manager) or full accounting features; plain Billing users do not see it
Opens on	This Month
Filters	Period (nine options and Custom Range) and the Refresh button. No journal or analytic filter.
Counts	Posted customer invoices and vendor bills of the current company

The Accounting board on This Year.

The nine cards

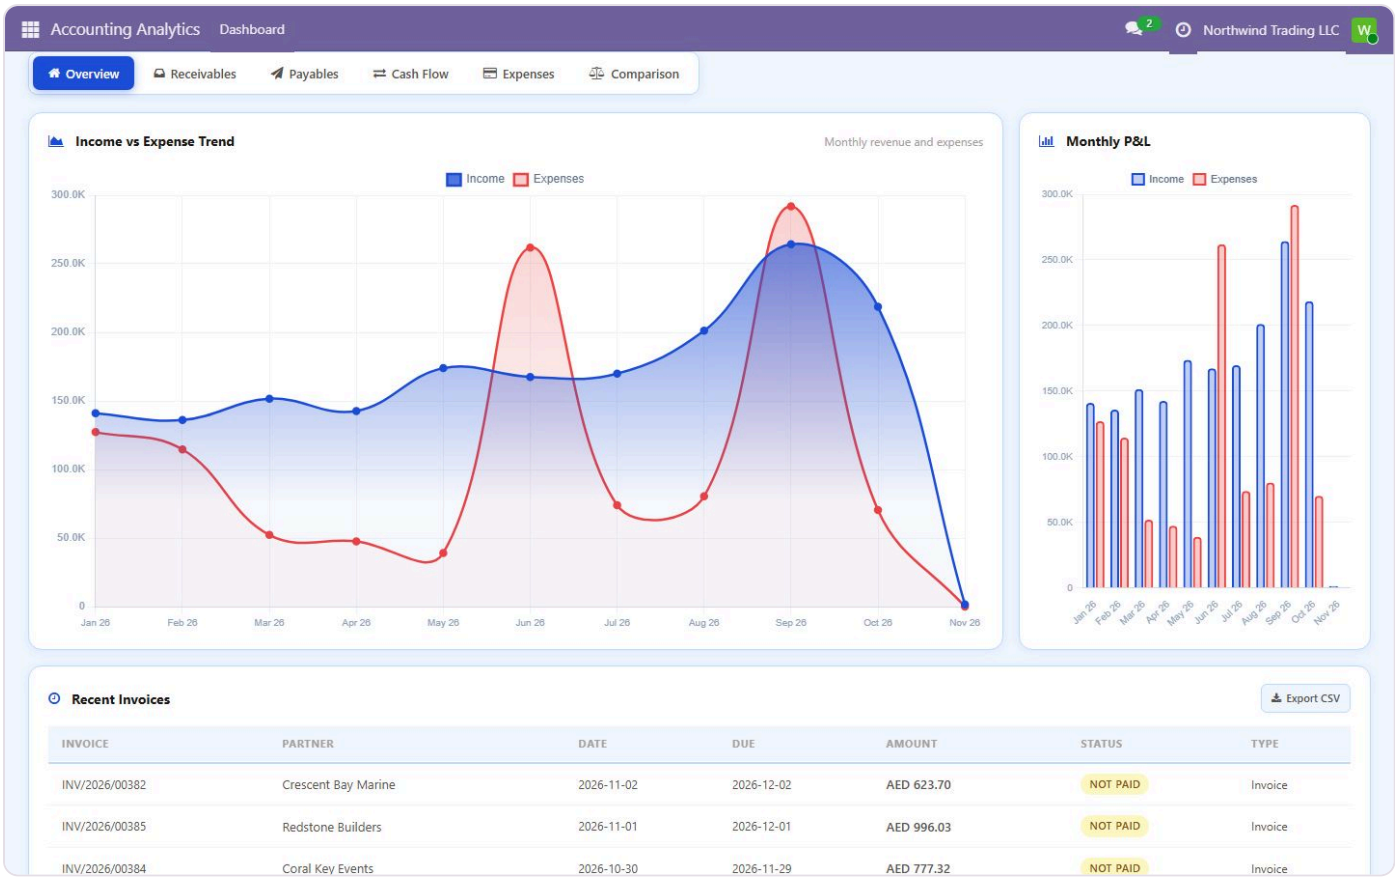

CARD	WHAT IT COUNTS	PERIOD?	CLICK OPENS
Total Revenue	Untaxed customer invoices dated in the period	yes	Customer invoices
Total Expenses	Untaxed vendor bills dated in the period	yes	Vendor bills
Net Profit	Revenue less expenses	yes	Customer invoices
Accounts Receivable	Open amount on unpaid and partly paid customer invoices	no	Those invoices
Accounts Payable	Open amount on unpaid and partly paid vendor bills	no	Those bills
Outstanding Invoices	Number of invoices behind the receivable	no	Draft entries (wrong list)
Overdue Invoices	Of those, past their due date	no	Invoices (wider list)
Avg Invoice Value	Average total of invoices dated in the period	yes	Invoices
Tax Collected	Tax on invoices dated in the period	yes	Invoices

> Net Profit is invoices less bills, before tax. Credit notes, journal entries such as salaries and rent, depreciation and stock adjustments are not in it: it is a trading indicator, not your profit. Invoices with a payment registered but not yet matched to the bank (In Payment) drop out of receivables and payables.

The tabs

Overview

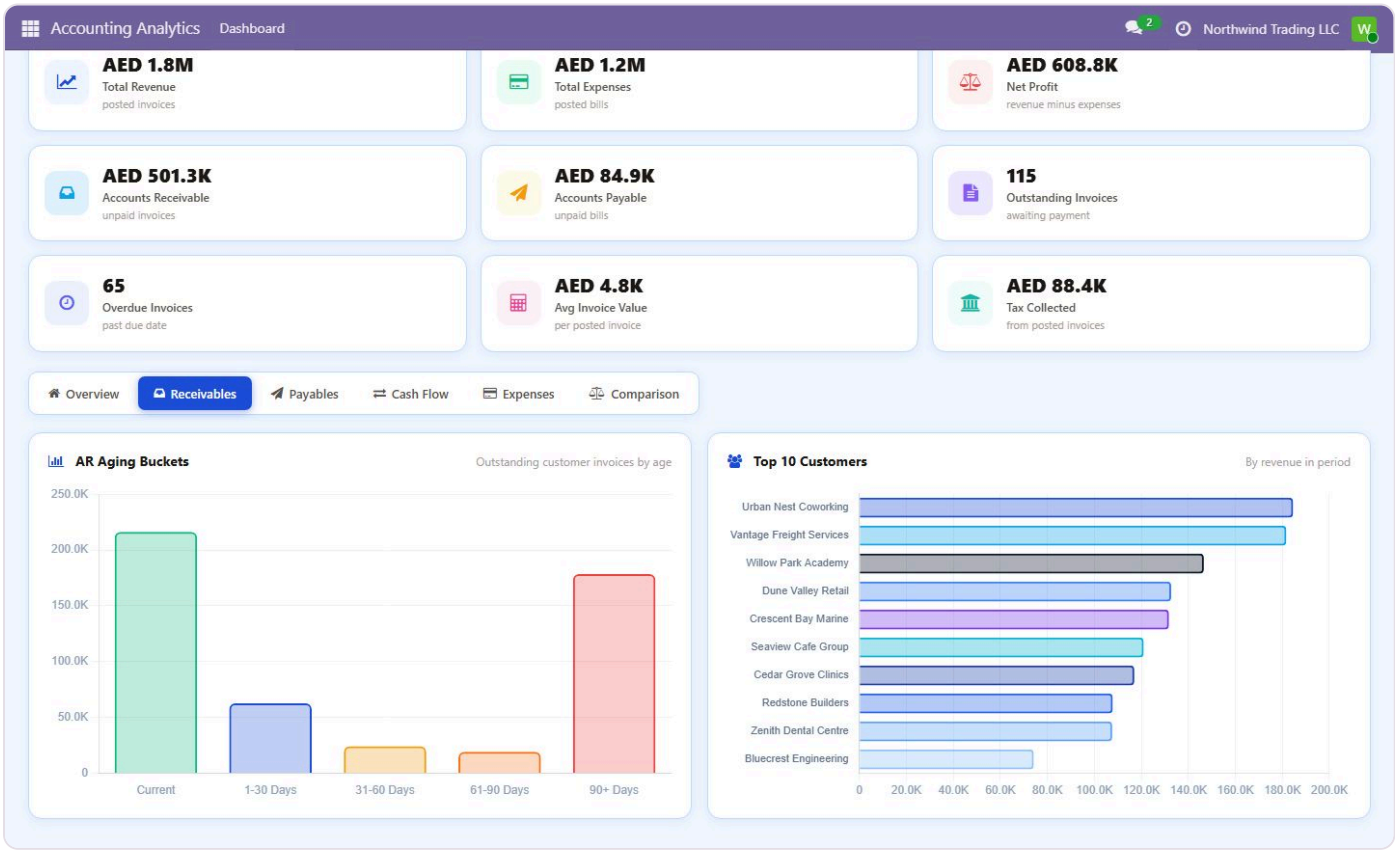

Income vs Expense Trend by month, Monthly P&L (always This Year, whatever the period) and Recent Invoices, the 20 latest posted invoices and bills in the period, with Export CSV. This Month shows a single point on the monthly trend.

Overview on This Year.

Receivables

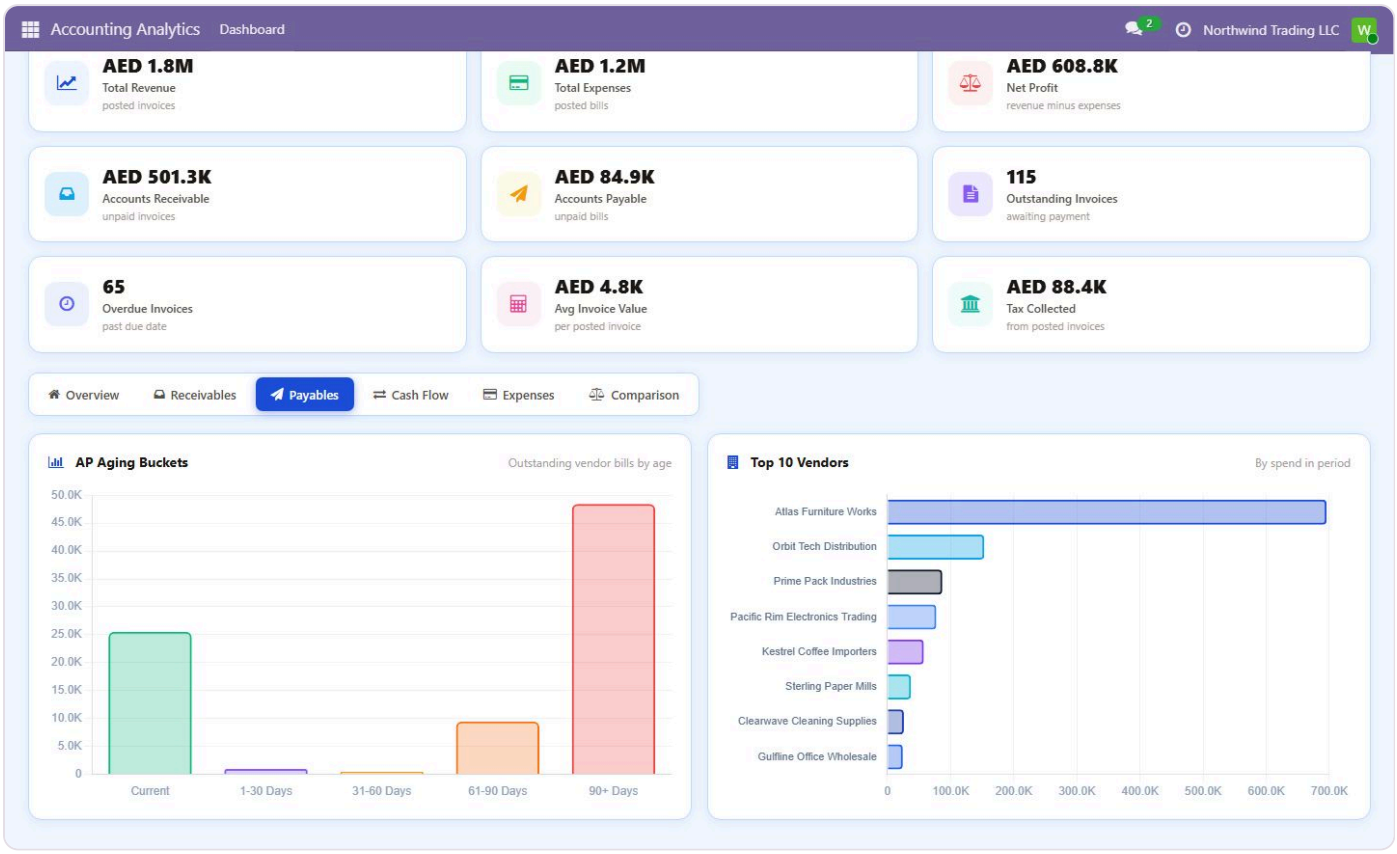

AR Aging Buckets (Current, 1-30, 31-60, 61-90, 90+ days past due, open amounts, all time) and the top ten customers by revenue in the period.

Receivables.

Payables

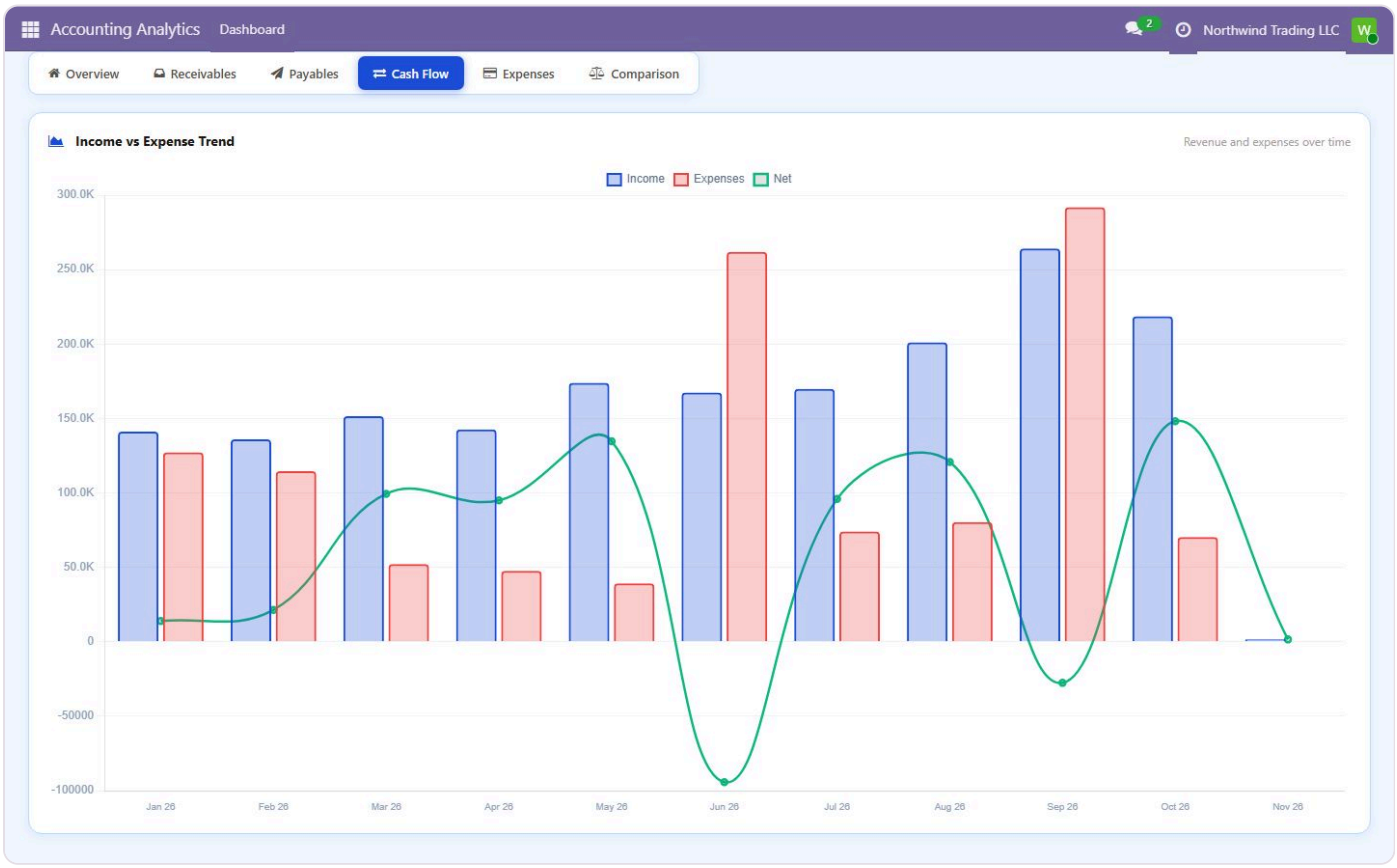

AP Aging Buckets and the top ten vendors.

Payables.

Cash Flow

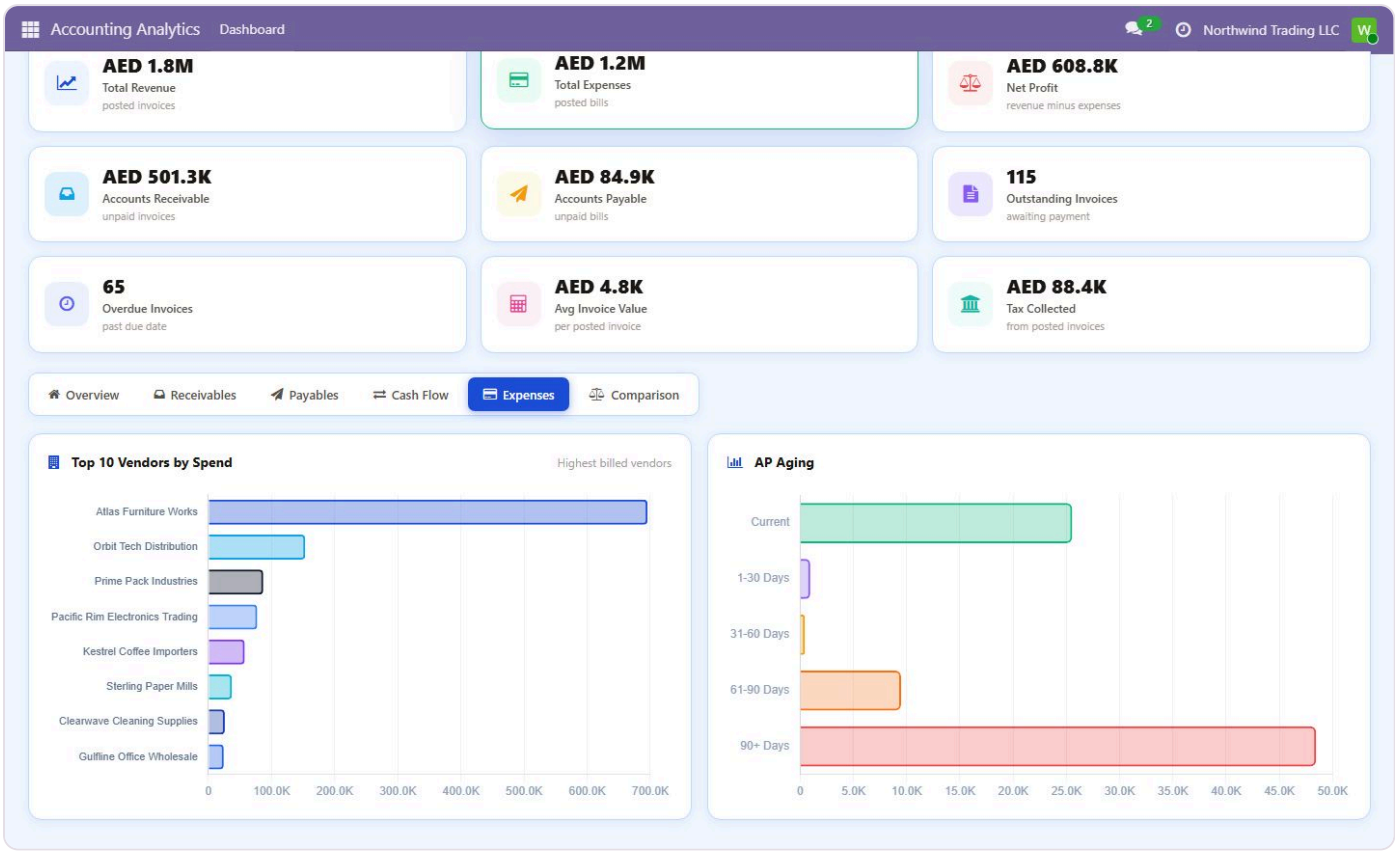

Invoiced income, billed expense and the difference by month, from invoices and bills, not from payments or the bank.

Cash Flow.

Expenses

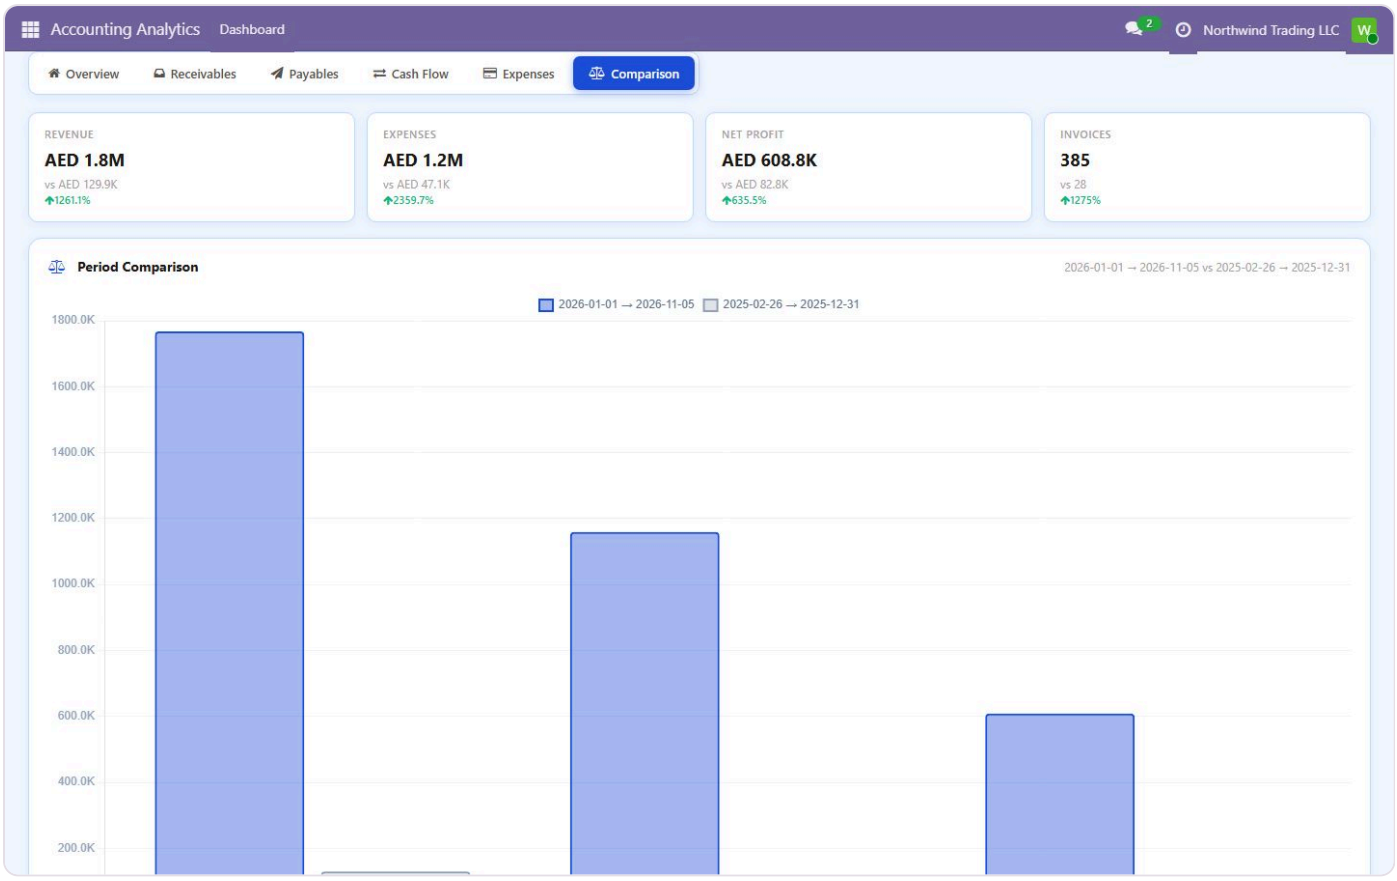

Top vendors by spend and the AP aging again.

Expenses.

Comparison

Revenue, expenses, net profit and number of invoices against the previous period.

Comparison.

Getting the figures right

1

Payment terms

Due dates, and so the buckets, come from them. Immediate payment makes everything overdue the next day.

2

Post when final

Drafts count nowhere on this board.

3

Register payments and reconcile

Paid invoices then leave the receivable.

4

Bills as vendor bills

Total Expenses only knows bills entered as vendor bills.

Limits in this version

- Credit notes and vendor refunds are not deducted.
- Open amounts and tax are added in each invoice's own currency, so multi-currency totals are unreliable.
- Outstanding Invoices opens all draft entries instead of the open invoices; the Overdue list is wider than the card.
- The listing's journal and analytic filters, payments tab, cash balance and P&L waterfall are not in this version.

PART 10 The Project dashboard

Tasks done, overdue and due today, who carries the load, and how far each project has come. Almost every card is a picture of now.

IN THIS PART YOU WILL LEARN

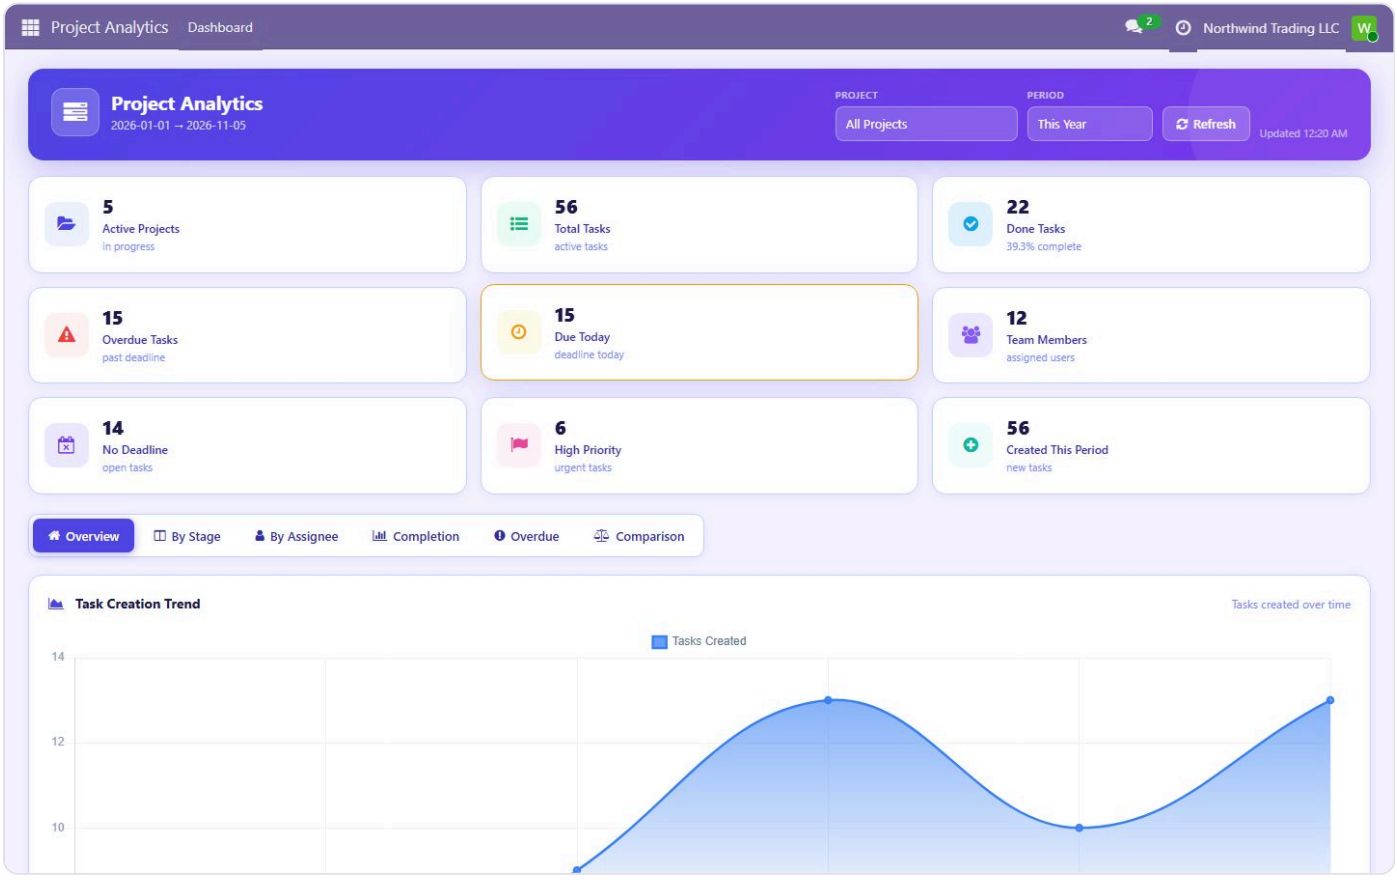

- How the board decides a task is done
- The nine project cards
- The stand-up list on the Overdue tab
- Why the project selector should stay on All Projects

TRY IT YOURSELF ON THE DEMO

1. Open Project Analytics
2. Open the Overdue tab
3. Open Completion and find the slowest project

Opening the board

Module	Project Dashboard (wt_project_dashboard, USD 20)
App tile and menu	Project Analytics, Dashboard
Who sees it	Project users and administrators
Opens on	This Month
Filters	Project (All Projects or one active project), Period (nine options and Custom Range) and the Refresh button. No assignee filter.
Counts	Projects and tasks of the current company or with no company

The Project board for the five demo projects.

The nine cards

CARD	WHAT IT COUNTS	PERIOD?	CLICK OPENS
Active Projects	Projects not archived	no	Projects
Total Tasks	Active tasks, all time	no	Tasks
Done Tasks	Active tasks in a folded stage, with completion %	no	Tasks
Overdue Tasks	Deadline before today, stage not folded	no	Tasks
Due Today	Today's deadline, any stage	no	Tasks
Team Members	Different people assigned to active tasks	no	Users
No Deadline	Open tasks without a deadline	no	Tasks
High Priority	Open tasks starred high priority	no	Tasks
Created This Period	Tasks created in the period	yes	Tasks

Done means a folded stage. The task's own Odoo 19 status (the Done tick) is not read. Fold your Done and Cancelled stages in the kanban column settings, and move finished tasks into them, or they stay open and can show as overdue.

The tabs

Overview

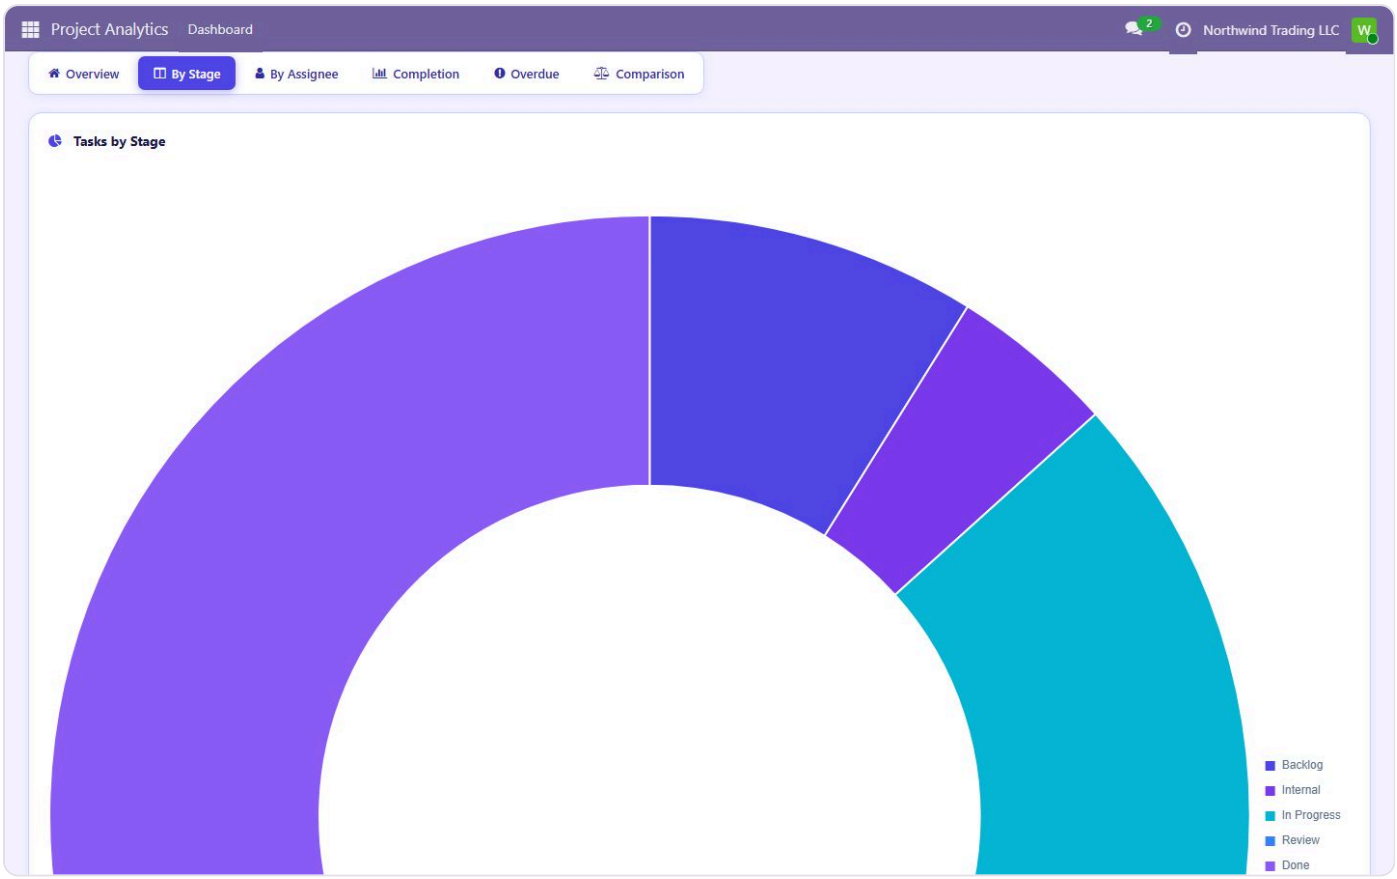

Task Creation Trend (by day up to 60 days, by month beyond) and Recent Tasks, the 20 latest created in the period, with Export CSV.

Overview.

By Stage

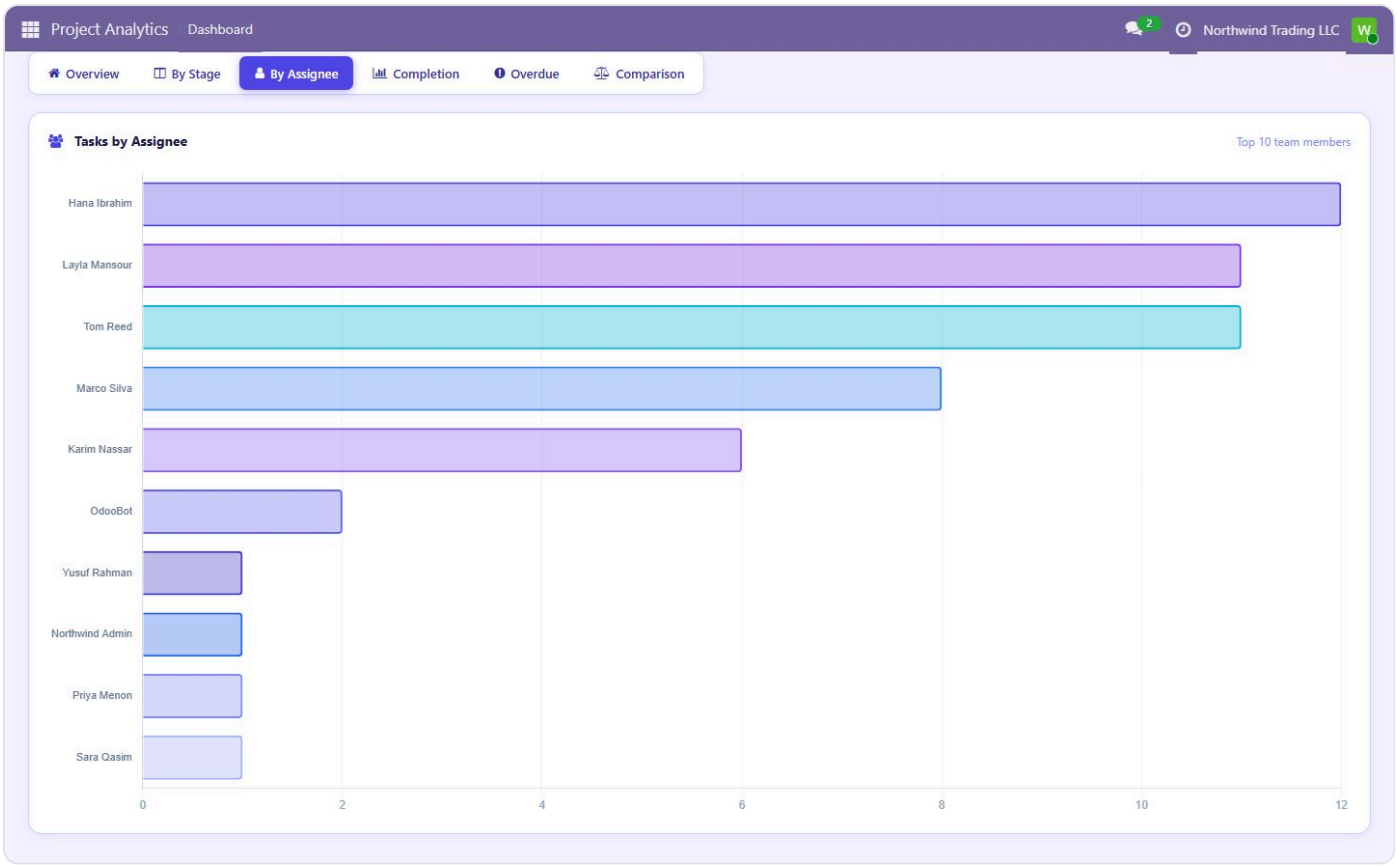

Tasks in each stage now, as a doughnut.

By Stage.

By Assignee

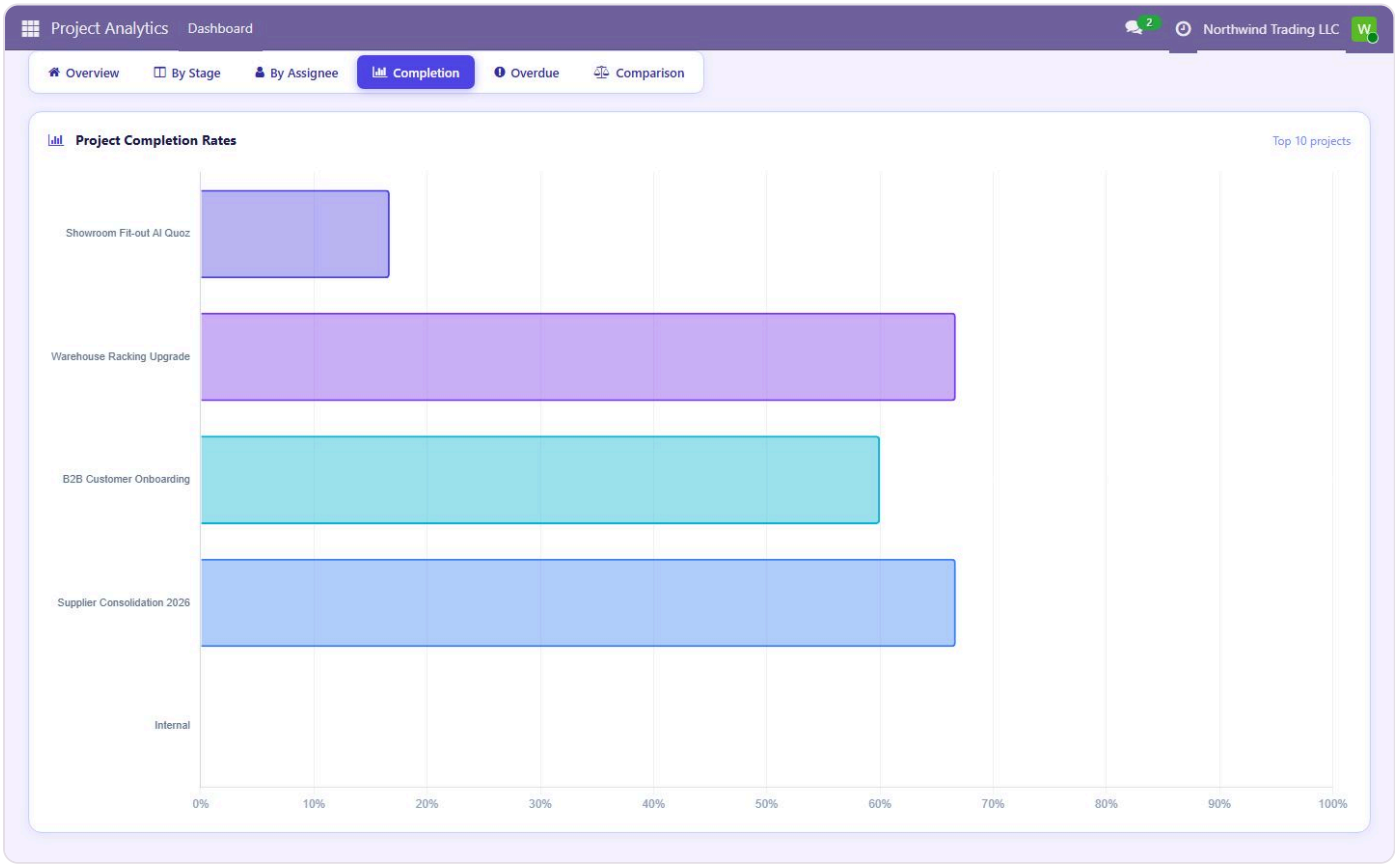

Tasks created in the period per person; a task with two assignees counts for both.

By Assignee.

Completion

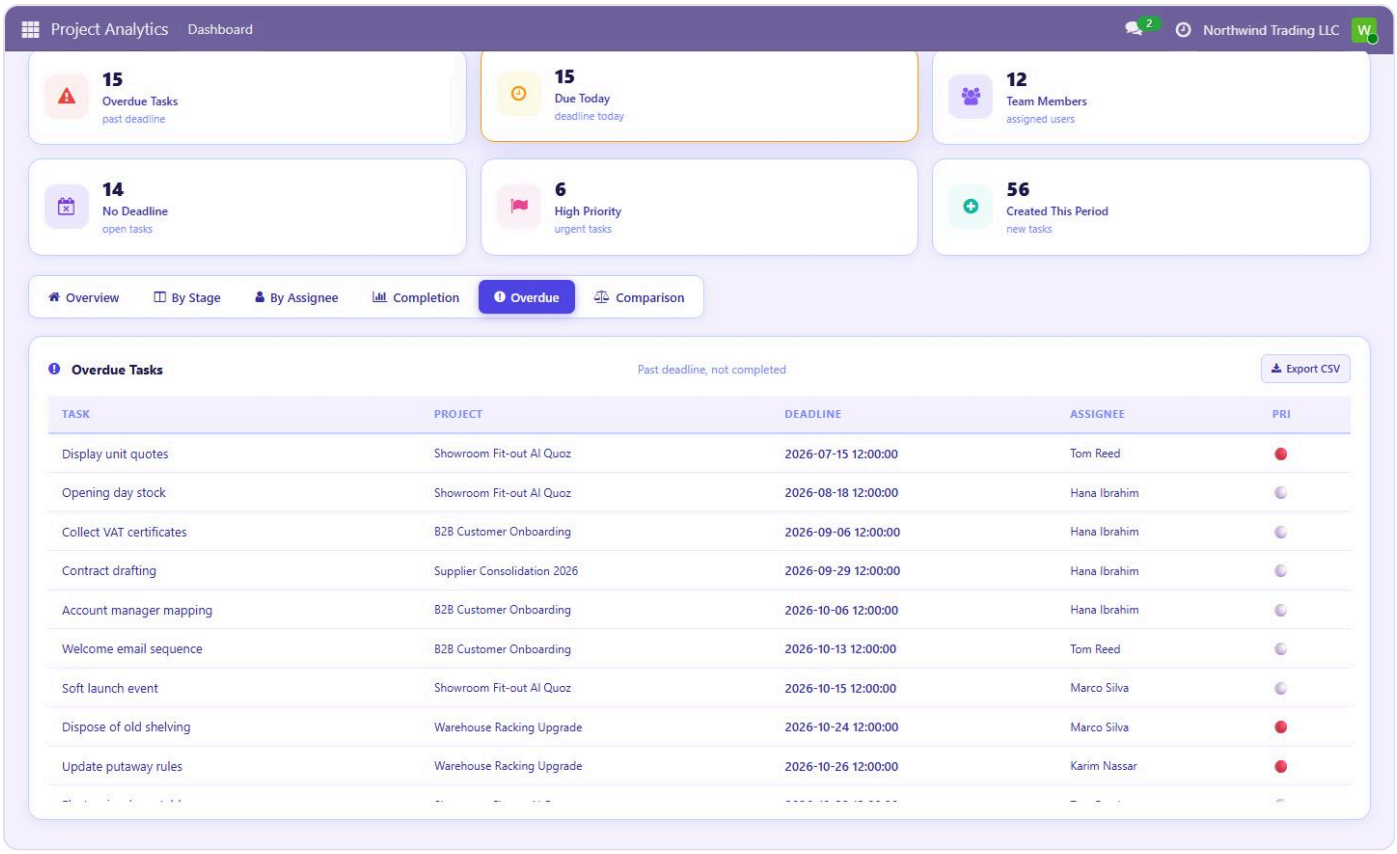

Share of each project's tasks in a folded stage, ten largest projects.

Completion.

Overdue

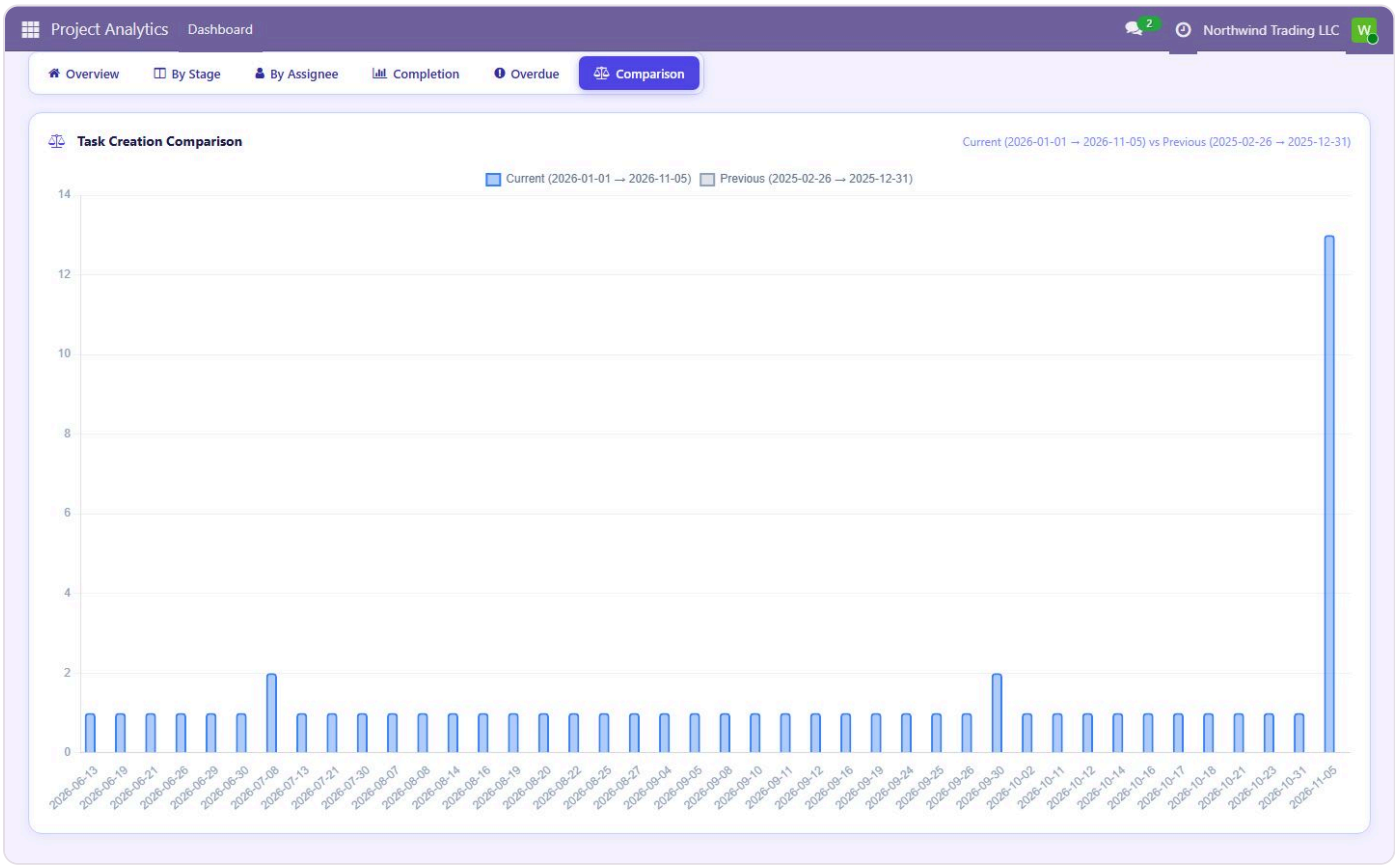

Overdue Tasks: task, project, deadline, assignee and a priority dot, with Export CSV. The stand-up list.

Overdue.

Comparison

Tasks created per day in this period and the one before.

Comparison.

Leave the project selector on All Projects. In this version choosing one project makes the headline figures fail to load: the project id and the date are passed to the database in the wrong order. Compare projects on the Completion tab until the module is updated.

Getting the figures right

1

Fold the Done stage

Kanban column settings, Folded in Kanban, for Done and Cancelled.

2

Deadlines on tasks

A task with no deadline can never be overdue; watch the No Deadline card.

3

Assign tasks

Team Members and By Assignee come from assignees.

4

Stars for priority

High Priority counts starred open tasks.

Limits in this version

- The project selector breaks the headline figures.
- Task counts and Team Members include personal to-dos (tasks with no project), such as the welcome to-do Odoo gives each new user.
- Done ignores the task status; only folded stages count.
- A task with two assignees appears twice in the Recent and Overdue tables; the Overdue export's Stage column is empty.
- Counts include private projects for anyone who can open the menu.
- The listing's timesheet hours, milestones and deadline heat map are not in this version.

PART 11 The Dashboard Builder

For the figures the ready-made boards do not have. A board is a set of tiles; each tile points at any model in your Odoo, with a measure, an optional filter and, for charts and lists, a field to group by. No code.

IN THIS PART YOU WILL LEARN

- The three menus and the Dashboard Designer group
- The four tile types and five measures
- Group-by fields, limits, colours, icons and sizes
- Filters with rolling dates and targets
- Restricting a board to groups, and the limits

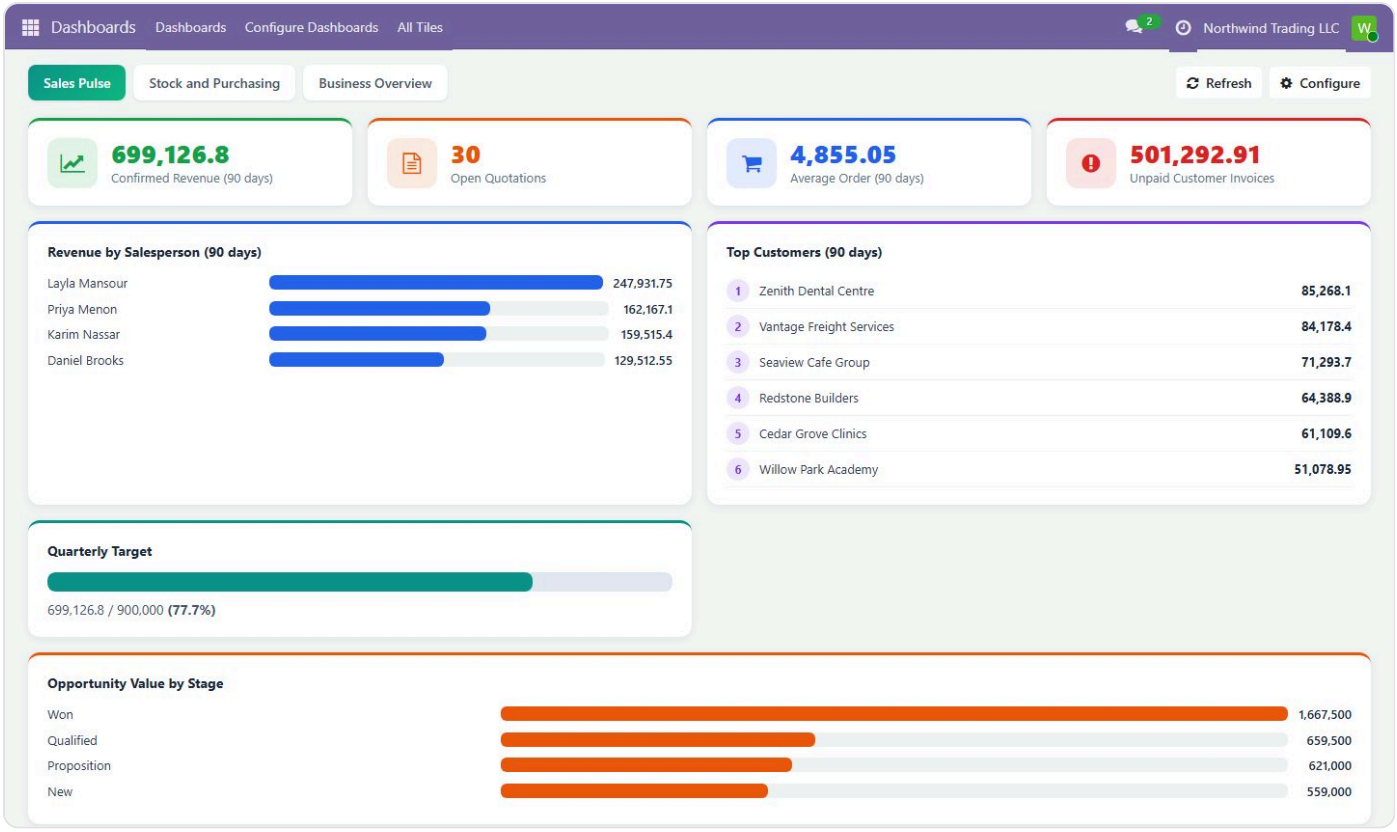

TRY IT YOURSELF ON THE DEMO

1. Open Dashboards and switch between Sales Pulse, Stock and Purchasing and Business Overview
2. Drag a tile to a new place and reload: the order is kept in this browser
3. Open Configure Dashboards and look at the Sales Pulse tiles (do not save changes)

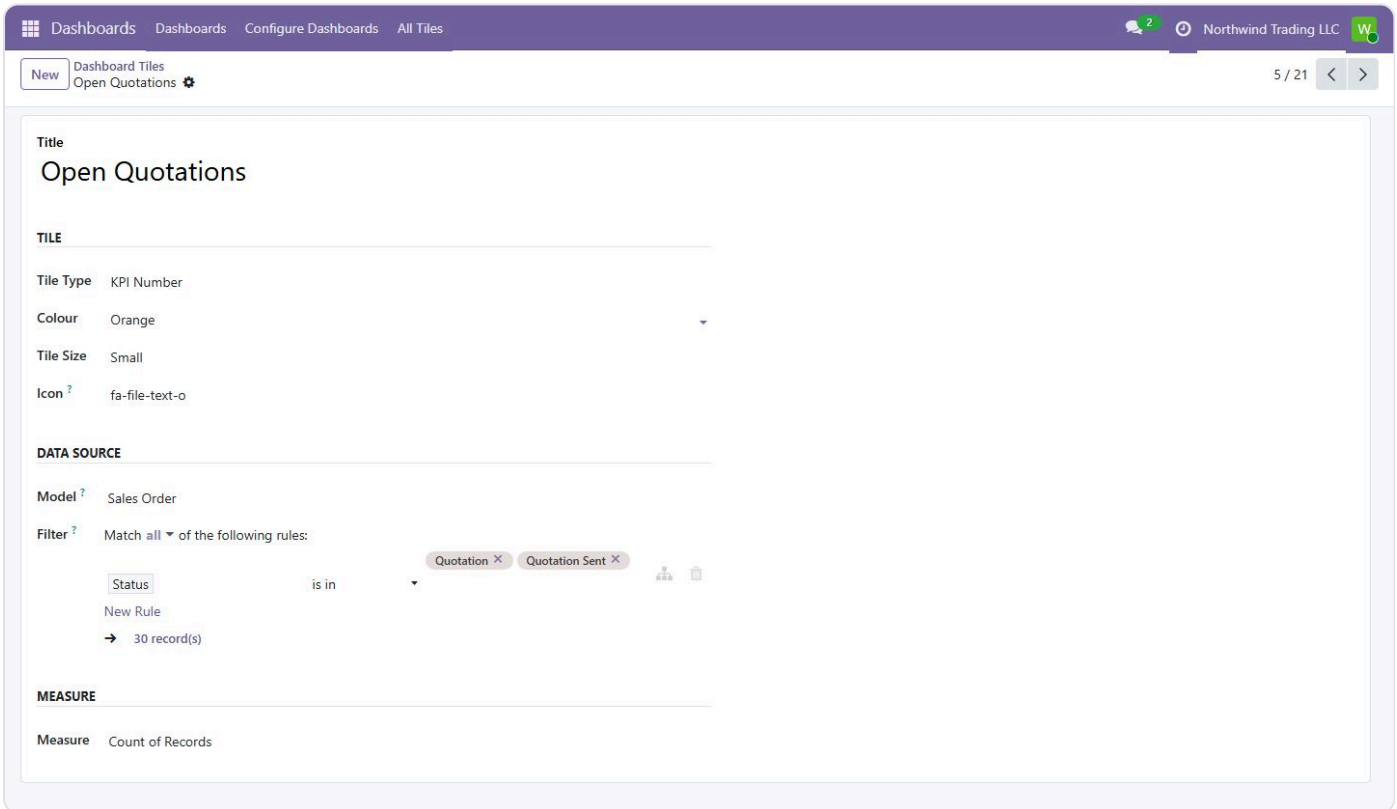

Where it lives

MENU	WHAT IT IS	WHO
Dashboards, Dashboards	The boards: one tab per board, Refresh and Configure buttons	Every internal user
Dashboards, Configure Dashboards	The list of boards with their tiles	Dashboard Designer
Dashboards, All Tiles	Every tile on every board in one list	Dashboard Designer

Viewers can read boards; to build them, add the person to the **Dashboard Designer** group on their user (Settings, Users, the Dashboard Builder section). The module ships a **Business Overview** board with six tiles on contacts and users, so the app is never empty.

Sales Pulse, built on the demo: four KPI tiles, revenue by salesperson, top customers and a quarterly target.

A KPI tile, Open Quotations: count of sales orders whose status is Quotation or Quotation Sent.

The four tile types

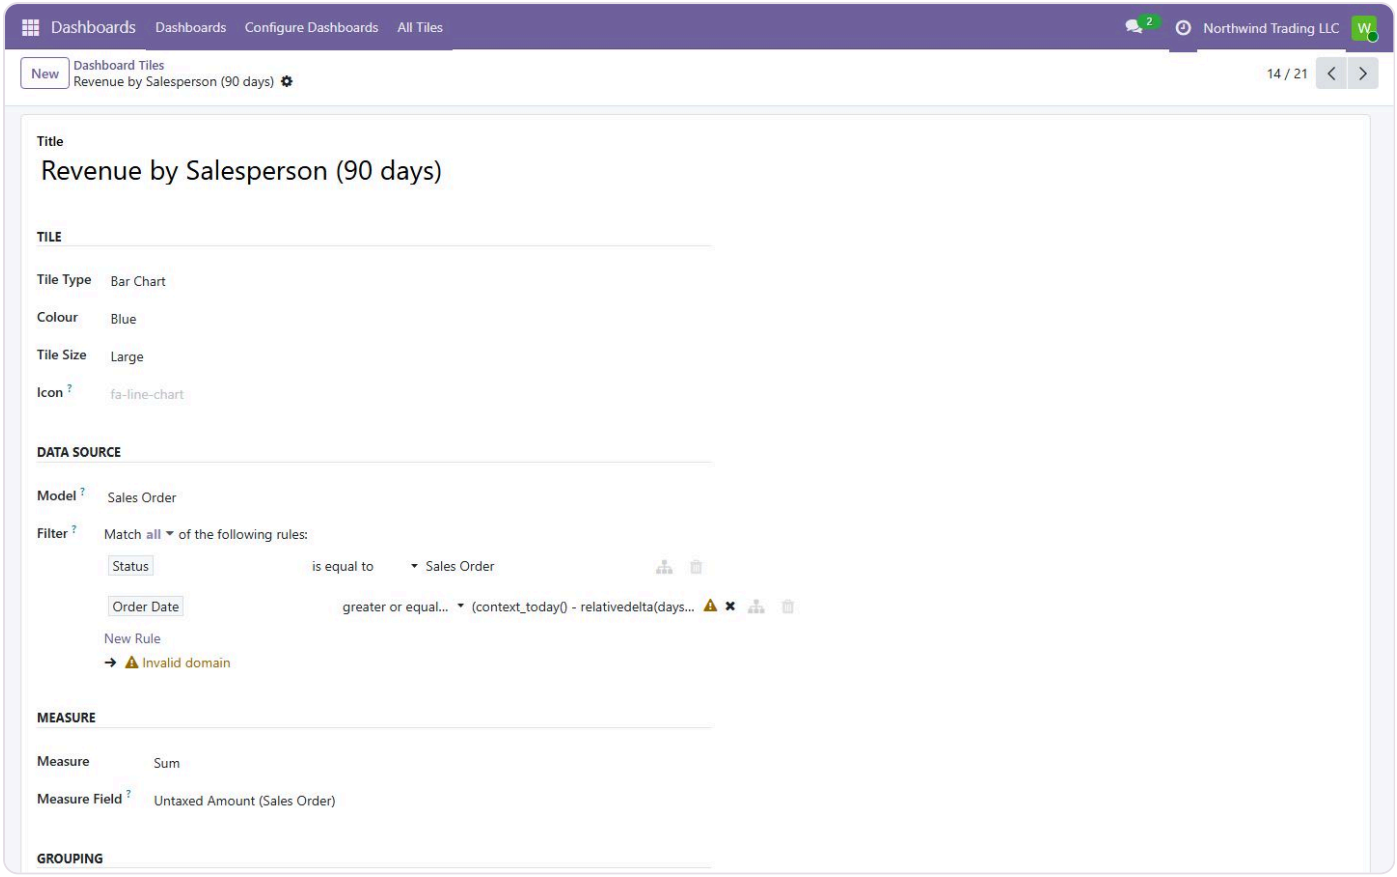

TYPE	SHOWS	NEEDS
KPI	One number with an icon and the tile name	A measure
Bar	Horizontal bars per group, largest first	A measure and a group-by field

List	A ranked list of groups and their value	A measure and a group-by field
Progress	The value as a share of a target, with a bar	A measure and a Target Value

Every field on a tile

FIELD	WHAT IT DOES
Name	The tile title
Dashboard and Sequence	Which board, and the order on it
Type	KPI, Bar, List or Progress
Model	Any model installed, including custom ones
Filter (domain)	Which records count, as an Odoo domain; empty means all
Measure	Count, Sum, Average, Minimum or Maximum
Measure field	The integer, decimal or money field for anything but Count
Group by	A link, selection, date or date-time (by month), text or yes/no field
Limit	How many groups a bar or list shows, 8 by default
Target Value	For progress tiles: the figure that means 100%
Colour	Teal, blue, green, orange, purple, red or slate
Icon	A Font Awesome name for KPI tiles, such as fa-users
Size	Small, medium, large or wide

A tile with a measure other than Count refuses to save without a measure field, and bar and list tiles refuse to save without a group-by field.

A bar tile: confirmed sales of the last 90 days, summed and grouped by salesperson.

Building a board

1

Create the board

Configure Dashboards, New. Name, sequence (lower comes first in the tabs) and a short description.

2

Choose who sees it

Leave Groups empty for everyone, or pick groups. Only members see the tab.

This hides the tab; it is not a security rule.

3

Add tiles

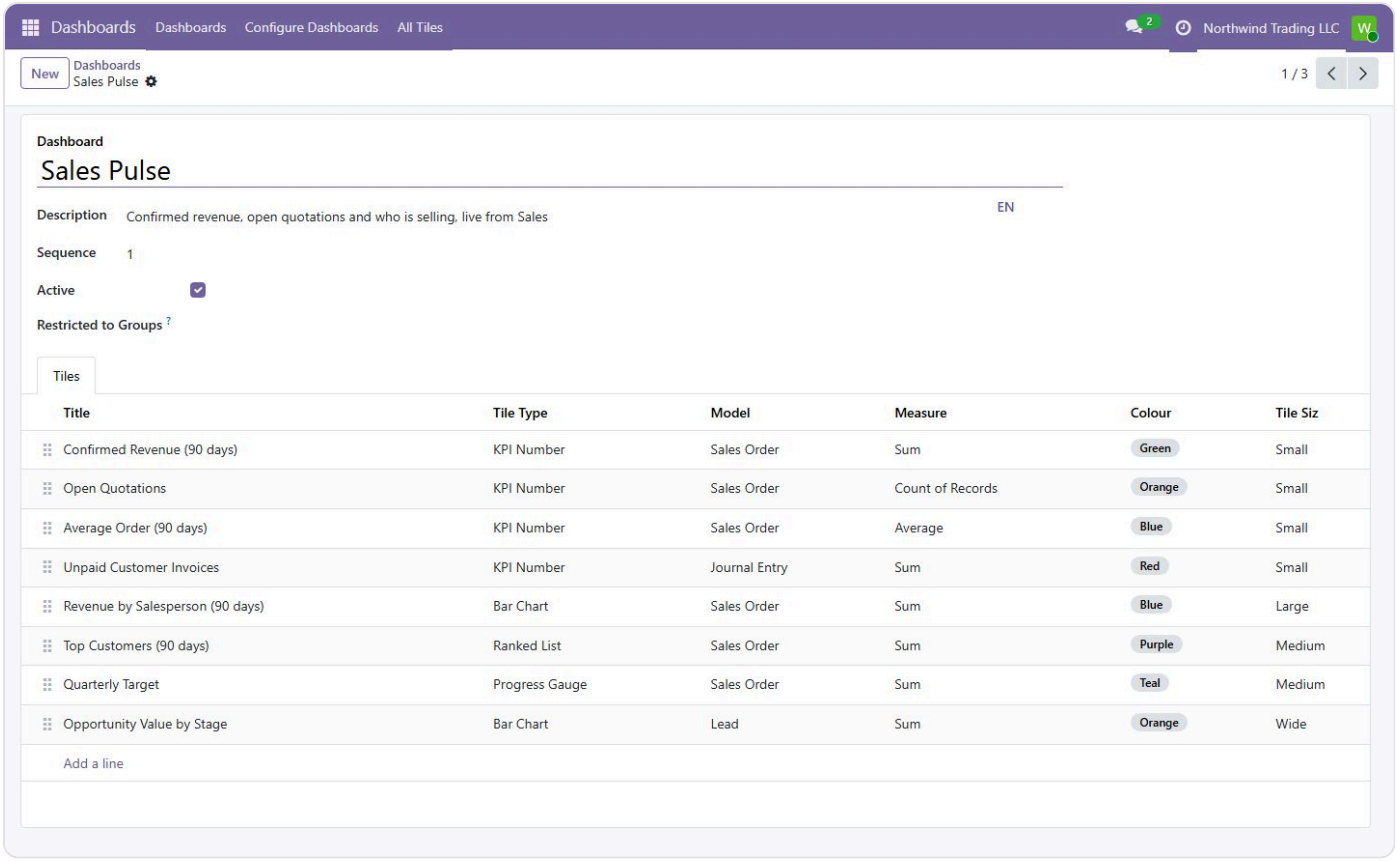

In the tiles list: type, model, measure and field, group-by for bars and lists, filter, colour, icon and size.

4

Arrange

Open Dashboards, choose the board and drag tiles into order.

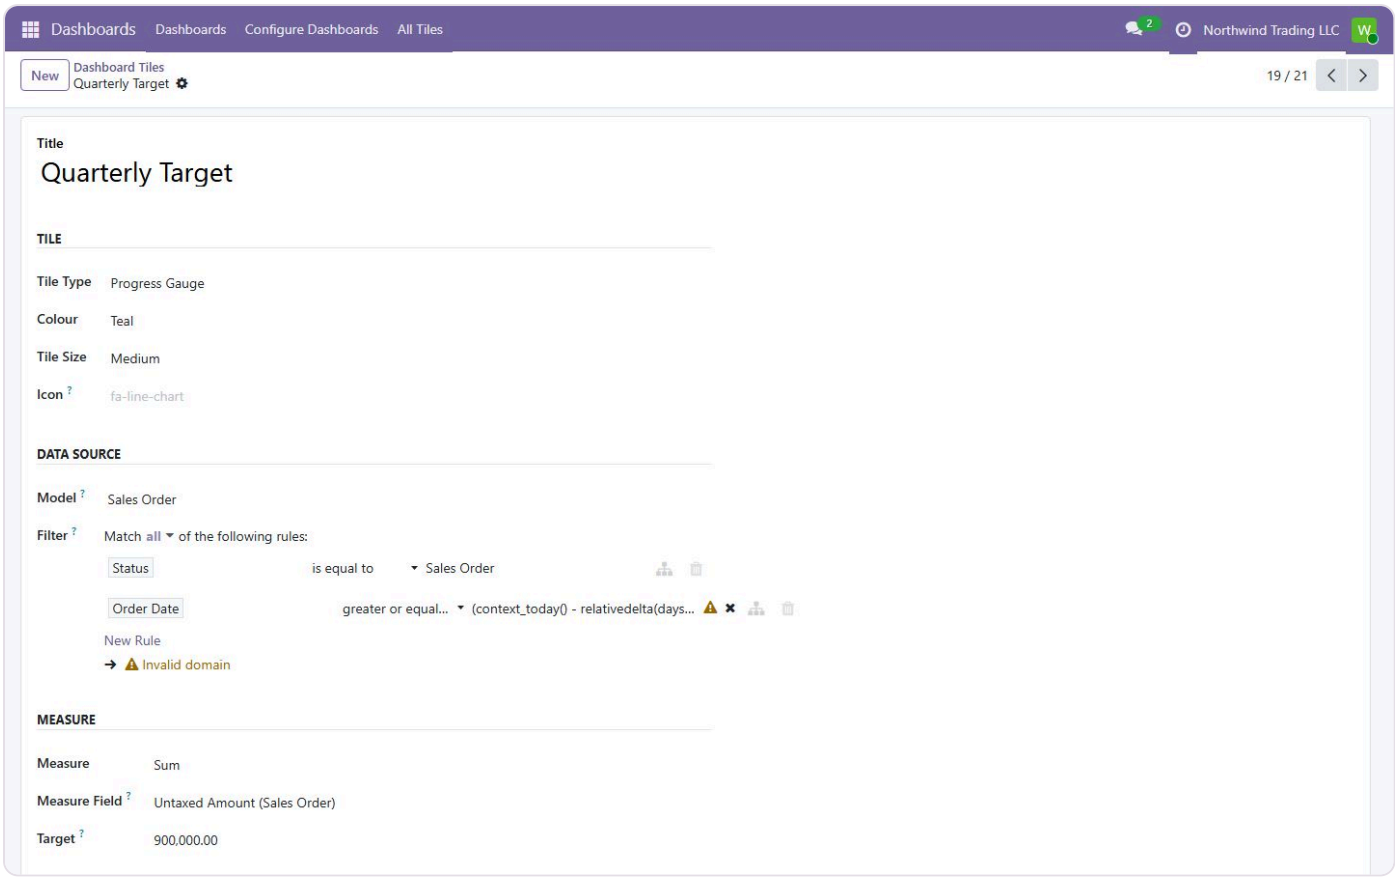

The order is kept in that browser only.

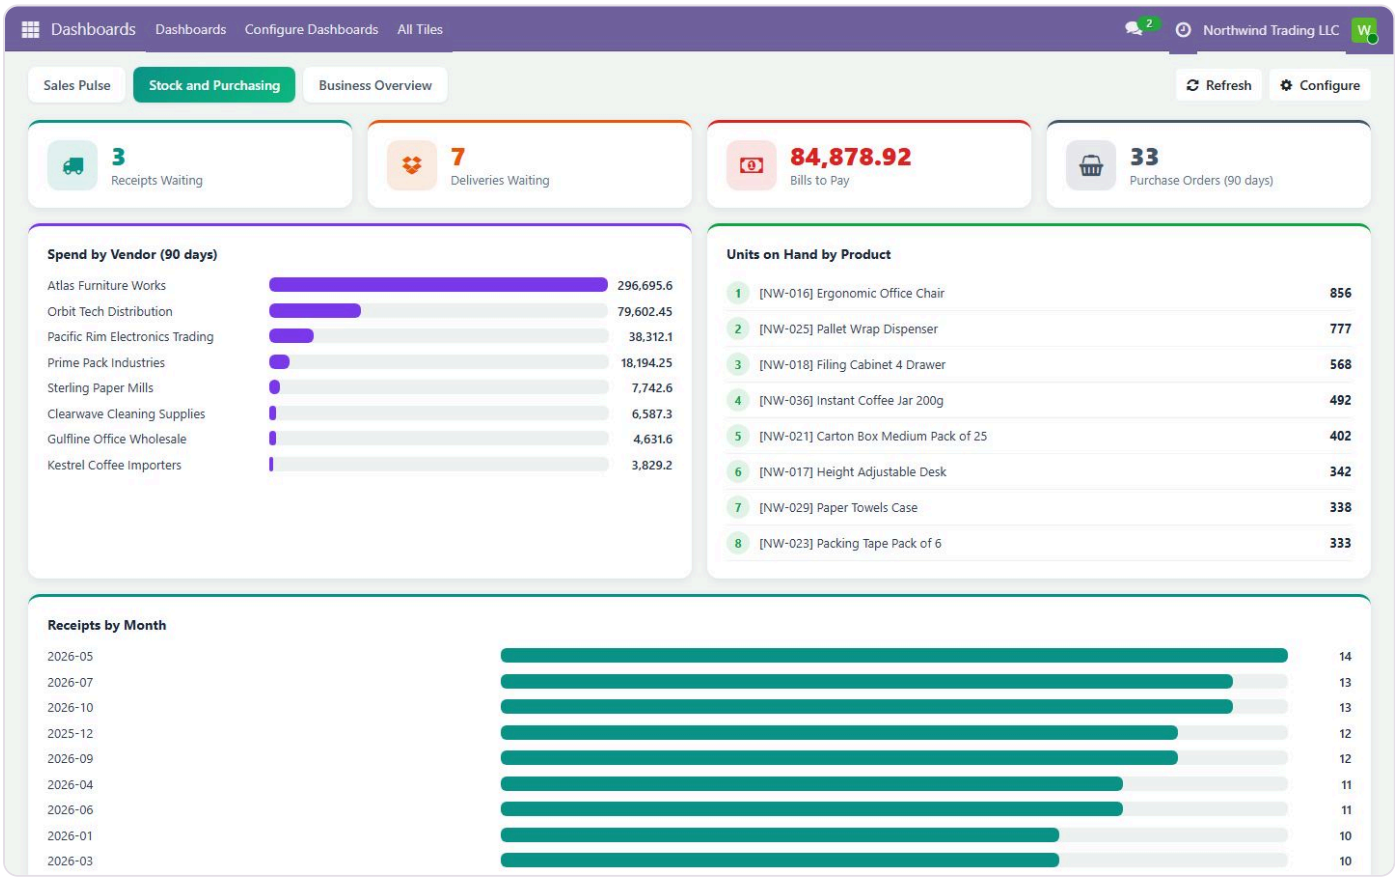

A board in Configure Dashboards with its tiles.

Filters with dates, users and targets

On the tile form the filter is Odoo's rule editor: **Match all of the following rules**, then a field, an operator and a value, with a live count of matching records under it. Behind it the filter is an Odoo domain such as `[('state','=','sale')]`, which can be typed in developer mode. It can use **context_today()**, **relativedelta**, **datetime** and **uid**. The demo's 90-day tiles use `('date_order','>=',(context_today() - relativedelta(days=90)).strftime('%Y-%m-%d'))`, which the form's rule editor flags as **Invalid domain** because it cannot preview it, although the board evaluates it correctly; `[('user_id','=',uid)]` gives each viewer their own records. There is no period switch on a board, so a tile's period lives in its filter. A progress tile divides the value by its Target Value: the demo's Quarterly Target sums confirmed revenue over 90 days against 900,000.

The Quarterly Target progress tile.

Stock and Purchasing: transfers waiting, bills to pay, purchase orders, spend by vendor and stock on hand.

Business Overview, the board the module creates on install.

Limits. A tile loads every matching record to work out its figure, so a tile on a very large model without a filter can be slow. A filter that cannot be read is silently ignored and the tile then counts the whole model: check a new tile against the app. Month groups are ordered by value, not date. Groups hide a tab but do not stop a board being opened another way. In this version, users without the Access Rights technical group also need read access to Odoo's model and field lists for tiles to load; without it every tile shows No access. The demo grants that read access to internal users.

PART 12 A fifteen minute walk-through

The order that shows the suite best to somebody seeing it for the first time, on the demo.

MINUTE	WHERE	SAY AND SHOW
0-1	Home screen	*One app tile per board, next to the app it reads. No setup screens.*
1-4	Sales Analytics	*This Month, then This Year. Click Total Revenue to show the orders behind it. Products and Salespersons tabs.*
4-6	CRM Analytics	*Overdue Activities, then the Pipeline tab: where deals are stuck and what they are worth.*
6-8	Purchase and Inventory	*Vendors tab for concentration; Alerts tab for what to buy today.*
8-10	POS Analytics	*Today on both counters, then one terminal and one cashier. Busiest Hours and Sessions.*
10-12	Accounting Analytics	*Receivables aging; click Overdue Invoices.*
12-13	Project Analytics	*The Overdue tab as the stand-up list; Completion per project.*
13-15	Dashboards	*Sales Pulse: a board built without code, with a target. Open a tile to show how.*

Before a demo, check the period labels under each title: the demo data runs up to the day it was last refreshed. Do not click the project selector on the Project board (Part 10).

PART 13 Questions people ask

QUESTION	ANSWER
Does it need Enterprise?	No. All eight modules are for Odoo 19 Community and depend only on the app they read.
Do salespeople see everyone's totals?	Yes. The ready-made boards count company-wide. Keep the menus for managers if that matters. The builder reads with each user's rights.
Is revenue before or after tax?	Sales, Purchase and Accounting use untaxed amounts. POS revenue includes tax.
Booked or invoiced?	Sales and Purchase count orders by order date. Accounting counts posted invoices by invoice date.
Can I filter by salesperson or warehouse?	No. Only POS has terminal and cashier, and Project has a project selector.
Can I set a monthly target?	Not on the ready-made boards. Use a progress tile in the builder.
Why is stock value zero?	Odoo 19 no longer has the valuation table the Inventory board reads. Use Inventory, Reporting, Stock.
Why are POS hours shifted?	They are in server time (UTC), not the shop's time zone.
Does it work with several companies?	Each board counts the company you are working in at the top right; the others are ignored.
Is the data live?	Yes. Every load reads the database; most boards reload every five minutes while open.
Can I export?	Tables export the rows on screen as CSV. POS exports every order line in the period.
Does it slow Odoo down?	The ready-made boards run a few grouped queries per load. Builder tiles on very large models should have a filter.

PART 14

The menu map

Sales Analytics

Dashboard	Revenue, orders, quotations, conversion; Overview, Products, Customers, Salespersons, Performance, Comparison

POS Analytics

(one screen)	Takings by terminal and cashier, margin, discounts; Overview, Financial, Products, Customers, Sessions, Compare; Export CSV

CRM Analytics

Dashboard	Leads, opportunities, won, lost, win rate, pipeline; Overview, Pipeline, Salespeople, Sources, Comparison

Accounting Analytics

Dashboard	Revenue, expenses, AR, AP, overdue; Overview, Receivables, Payables, Cash Flow, Expenses, Comparison

Purchase Analytics

Dashboard	Spend, POs, RFQs, vendors, bills; Overview, Vendors, Products, Payables, Performance, Comparison

Project Analytics

Dashboard	Done, overdue, due today, workload; Overview, By Stage, By Assignee, Completion, Overdue, Comparison

Inventory Analytics

Dashboard	On hand, low and out of stock, pending moves; Overview, Stock Levels, Movements, Valuation, Alerts, Comparison

Dashboards

Dashboards	Your boards, one tab each, Refresh and Configure
Configure Dashboards	Boards and their tiles (Dashboard Designer)
All Tiles	Every tile in one list (Dashboard Designer)

Want these boards on your own Odoo?

We install the dashboards you need, check the user groups so the right people see the right figures, set up reorder rules, payment terms and stages so every card counts correctly, and build the first boards in the Dashboard Builder with your own targets.
