COMPLETE GUIDE · SETUP, EVERY SCREEN, EVERY STEP

Project Pro for Odoo 19

Boards with your own statuses and columns, a timeline and a workload view, daily standups, tickets with an SLA, timers, approvals that hold a task, automations you can preview and notifications each person controls. All on ordinary Odoo project tasks, on Community.

START

About this guide

Project Pro turns Odoo Project into the place a team actually runs its work: boards grouped by statuses you choose, a timeline and a workload view, a daily standup, tickets with a service level, approvals that really hold a task, automations you can preview, and notifications each person decides on. This guide walks every one of those screens, step by step. You do not need to have used Odoo before.

Who it is for

The manager setting Project Pro up, the people who post a standup and work items every day, the support agent on the ticket queue, the approver, and anyone seeing it for the first time.

How to read it

Front to back the first time. Each part opens with what you will learn and a short thing to try, then goes through every field and every button on the screen.

The live demo

A facilities company with a mobilisation project, a tenant helpdesk and a team of five, already set up with Project Pro. Open it and follow along.

HOW IT WORKS

The live demo

Address	**facility-demo.way4tech.com**
Sign in	**w4demo** / **Demo2026**
Open	the **Project Pro** app from the home screen
Runs on	Odoo 19, Community edition, with Timesheets, Employees and To-do installed

The demo is shared and resets from time to time, so anything you change may be changed back or seen by the next visitor. Some screens in this guide, the ones that need records in a particular state (approvals in flight, a week of standups, an automation log, a running timer), were taken on a second sample workspace called **Brightline Studio**, with a website project, an office move and a support queue. Every screen is the same module, version 19.0.1.11.3.

The badges

Everything in this guide is in Project Pro itself. A few features switch on only when another app is present, and those are marked:

Badge	Meaning
NEEDS TIMESHEETS	Uses Odoo's own Timesheets app (free, Community). Without it the timer, Log time, Spent column, My Time and Team Hours simply do not appear.
WEB PUSH ADD-ON	Phone notifications go through the separate Way4Tech **PWA Mobile App with Push Notifications** module (wt_pwa_push). Without it the push channel is skipped silently and the inbox, email and digest still work.
USES EMPLOYEES	Reads Odoo's Employees app when it is installed (teams from departments, the assignee's manager as approver). Without it, a fallback is used.
MANAGERS	Visible to Project managers only (the Project app's Administrator access level).

What is in the guide

PART 1	What Project Pro is, in five minutes	PART 2	The menus, and who sees what
PART 3	Sign in and find your way	PART 4	Setup from zero

PART 5	Teams and the daily standup	PART 6	Board templates and starting a board
PART 7	Board settings and columns	PART 8	Working on a board
PART 9	The item: its page and its verbs	PART 10	Home, My Day and the daily standup
PART 11	Time: timer, Log time, My Time and Team Hours	PART 12	Support: tickets with an SLA
PART 13	The timeline	PART 14	The workload view
PART 15	Approvals that hold a task	PART 16	Automations, with a dry run
PART 17	Notifications people actually read	PART 18	Background jobs and system settings
PART 19	Mails and pages it sends out	PART 20	A 15-minute demo script
PART 21	Questions people ask	PART 22	Menu map

PART 1 What Project Pro is, in five minutes

Odoo Project is a good task list. Project Pro adds the things a team of ten or fifty runs into after a month: a status that is not the same as a stage, columns of their own, a view of who is overloaded, a way to stop a task until somebody signs, rules that do the routine, and notifications people do not switch off.

IN THIS PART YOU WILL LEARN

- What a board is, and why every row on it is still an ordinary Odoo task
- The four engines: boards, approvals, automation and notifications
- The daily layer on top: Home, My Day, standups, time and tickets
- What the module deliberately does not do

One task model, nothing parallel

Project Pro never invents a second kind of item. A row on a board is a **project task**. Timesheets, chatter, followers, subtasks, recurrence, activities and any other app that knows about tasks keep working on it. Uninstall the module and your tasks are exactly where they were.

A **board** is a saved way of looking at a project. It belongs to one project, holds a **Status** column whose options become the groups (lanes) on the screen, says which options count as done, and can carry columns of its own: numbers, dropdowns, dates, people, progress bars, check boxes. A project can have several boards; one of them is its default and every new task lands on it.

From a project to a working board

1. **Project** — the standard Odoo project
2. **Board** — made from a template
3. **Statuses** — the lanes, with colours
4. **Columns** — your own fields on the row
5. **Items** — the project's tasks

The four engines

1. Boards

Tasks grouped by your statuses, edited in place, dragged between lanes, totalled per lane. Also a timeline (gantt style) and a workload view on the same tasks.

2. Approvals

Rules with ordered levels, a quorum per level, escalation after so many hours, delegation while somebody is away, and a hold that no screen can walk around.

3. Automation

Eight triggers and seven typed actions, no code. A dry run shows what a rule would do to real items before it is switched on, and a log explains every firing.

4. Notifications

One queue, four channels (inbox, email, phone, digest). Each person picks, per event, what reaches them, sets quiet hours and mutes things.

The daily layer

Home and My Day

The app opens on the person's own day: to-dos, items due, overdue, the standup and the boards they are on.

Standups and teams

Yesterday, today, blockers, posted from Home, the phone or Discuss, with reminders and a manager's view of who is missing.

Time

A timer on every item, Log time, a week grid and a team pivot, on Odoo's Timesheets app.

Tickets

A support board is a ticket queue with a customer, a channel and an SLA, an email alias, a public web form and a page where the customer follows the ticket.

3
view types of its own: board, timeline, workload

9
board templates, Support Desk included

8 x 7
automation triggers by typed actions

17 x 4
events by channels per person

What it does not do

Not included	What that means
A customer portal to the board	Customers never log in to a board or approve anything. A support ticket can give the customer a page with its status and replies, reached by a private link.
A native phone app	Every screen is responsive and works in the phone browser. Push to the phone needs the Web Push add-on.
Code in automations	Rules use typed actions only. Anything beyond them is a job for Odoo's own automated actions and a developer.
Resource planning	The workload view compares hours with a daily capacity. It does not know about leave, skills or cost, and it does not move work for you.
A planned start date	Community tasks have no planned start. Timeline and workload start a bar at the assignment date unless you point them at a start field of your own.

PART 2 The menus, and who sees what

The menu follows the day. Daily work sits on the left (Work, Team, Support), the two engines people act on next (Approvals, Notifications), then what you read afterwards (Reporting), help, and configuration for whoever sets it up.

IN THIS PART YOU WILL LEARN

- Where every screen lives in the menu
- Which menus only managers and administrators see
- The rule that decides which boards a person can open

Work

Home	Your day: My Day, the standup, your numbers, every board
Boards	Every work board as a card, with its done percentage
All Items	Every board item in one board view, grouped by project
Timeline	A gantt style chart of the items, by person or project
Workload	People against weeks: hours booked against capacity

Team

Standups	One team, one day: posted, missing, out, blockers
My Time	A week grid of your hours, a row per item
Team Hours	Timesheet pivot per person per week (managers)

Support

Tickets	Every ticket on every support board
Support Boards	The ticket queues, with open and breached counts

Approvals

To Approve	Requests waiting on you
All Approvals	Every request, open or decided
Set up a rule	A short form that writes an approval rule (managers)
Rules	The approval rules in full (managers)
Delegations	Who signs for you while you are away

Notifications

My Notifications	Your own feed
My Settings	What reaches you, how, and when

Reporting

Standup Log	Every standup posted
Automation Log	Every rule firing, block and failure (managers)
Notification Queue	Every notification row (administrators)

Help

Guide	The manual inside the app, with Show me and sample data
Set up in three minutes	Team, first board and support, in one pass (managers)

Configuration

Teams	Manager, members, standup time and channel
Board Templates	The nine starting points and your own
Automations	The rules and the seven starter recipes
Board Settings	Every board record, its layout and support settings
Columns	Every board column and its options
Notification Settings	Everyone's notification settings (administrators)

Access levels

Project Pro uses the access levels of the Project app itself, so there is nothing new to hand out.

Access	Sees and does
Project User	Home, boards they are on, All Items, Timeline, Workload, Standups, My Time, Tickets, their approvals and delegations, their notifications and settings, the Standup Log, the Guide.
Project Administrator (manager)	Everything above, every board, plus Team Hours, Set up a rule, Rules, the Automation Log, Set up in three minutes and the whole Configuration menu. Creating boards is a manager's

	job.
Settings (administrator)	Also the Notification Queue and everybody's Notification Settings.
Portal users and customers	Nothing in the back end. They are never put in a notification audience. A ticket's customer can use the public ticket page.

Which boards a person can open

A project manager sees every board. Anyone else sees a board when they are on its team, manage or follow its project, or hold an item on it. On a board they are not a member of, they see only their own items. The board's **Who sees this board** setting can open it to **Everyone in the company** instead of **The team and the people on its items**. Columns, status options, cell values, approvals, automation logs, notifications and settings follow the same line, so nothing leaks through another screen.

PART 3 Sign in and find your way

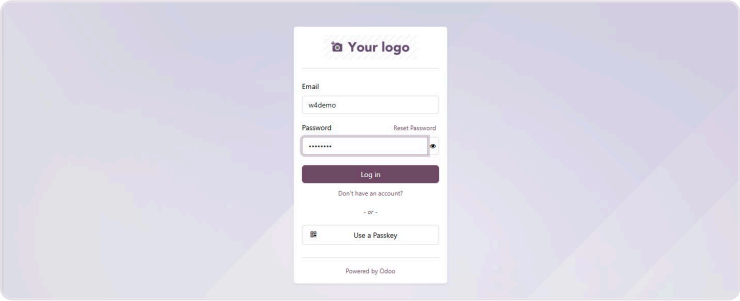

Everything starts from the Project Pro app. The first time each person opens a screen, a short set of tips walks it with them; Ctrl+K reaches any screen, board or item from anywhere.

IN THIS PART YOU WILL LEARN

- Signing in and opening the app
- The first-visit tips and how to bring them back
- The command palette (Ctrl+K)
- The running timer in the top bar

TRY IT YOURSELF ON THE DEMO

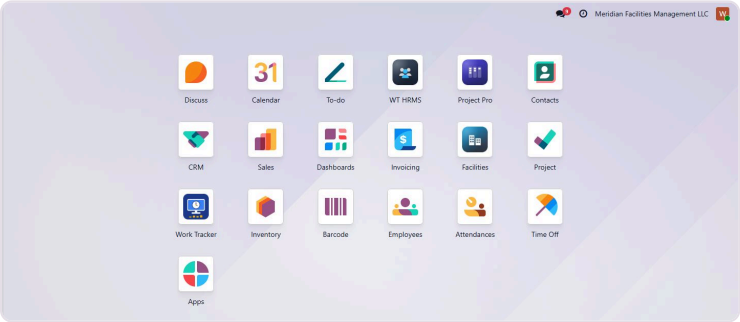

1. Sign in as w4demo / Demo2026 and open Project Pro
2. Press Ctrl+K and type Project Pro to see every shortcut
3. Open Help, Guide, and press Show me on any section

1

Sign in

Open the demo address, type the login and password and press **Log in**. On your own server, every user signs in with their normal Odoo account.

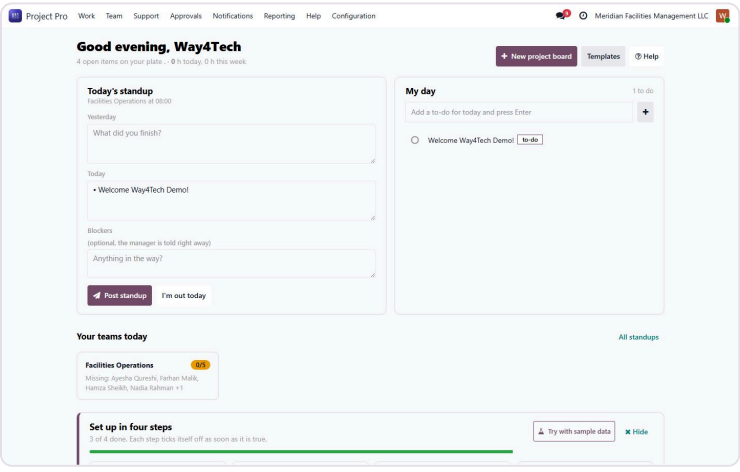

2

Open the app

The home screen lists the apps you can use. Press **Project Pro**. It sits next to the standard **Project** app, which still works on the same projects and tasks.

Project Pro is not an application of its own in the Apps list sense: it extends Project, so it installs next to it.

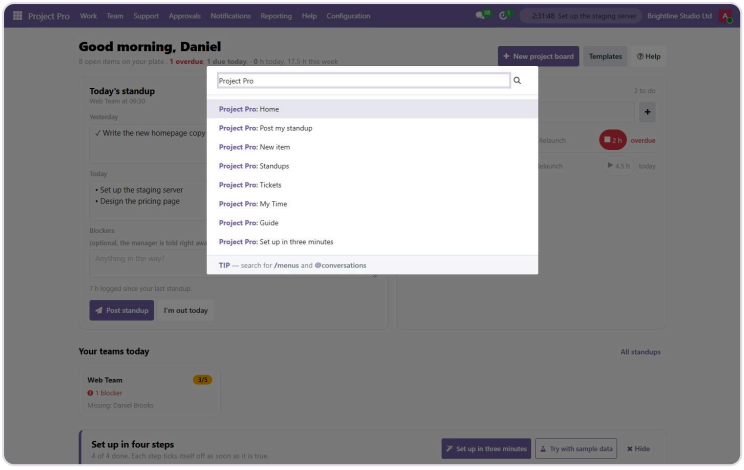

3

Follow the tips once

The first time you open Home, a board, the team page, tickets, approvals or automations, a card walks the screen with you: **Next**, **Back**, **Skip tips**. They show once per person, on every device.

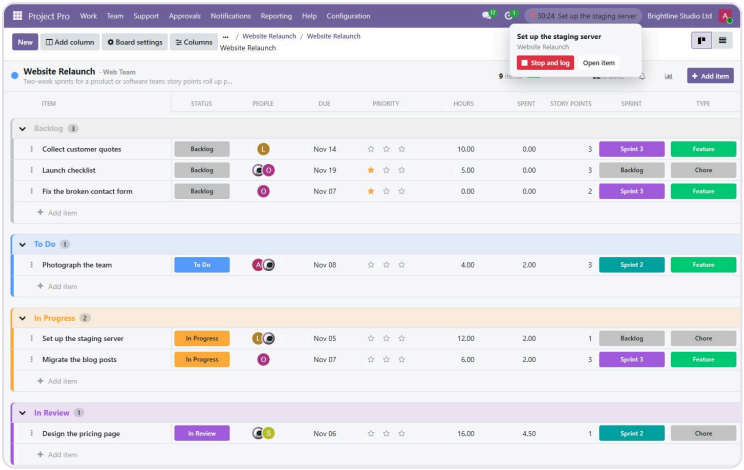

Home, Help, **Show the tips again** brings every set back for you.

4

Jump anywhere with Ctrl+K

Ctrl+K anywhere offers Project Pro: Home, a new item, Post my standup, Standups, Tickets, My Time, the Guide, Set up in three minutes, any board by name, any of your open items, and Start timer or Stop timer on one of them.

5

The timer in the top bar

While a timer runs, the top bar shows it on every page with the elapsed time and the item. Press it for **Stop** and **Open**.

Needs Timesheets.

PART 4 Setup from zero

A new install needs very little: a team, one board, and if you answer customers, a support board. One wizard does all three in about three minutes. Everything else has a sensible default and can wait until somebody asks for it.

IN THIS PART YOU WILL LEARN

- What to set up, in what order, and where each setting lives
- The Set up in three minutes wizard, step by step
- The sample workspace: load it, look around, remove it
- The four-step checklist on Home

TRY IT YOURSELF ON THE DEMO

1. Open Help, Set up in three minutes, and step through it without pressing Finish
2. Open Help, Guide, and read the Start here section

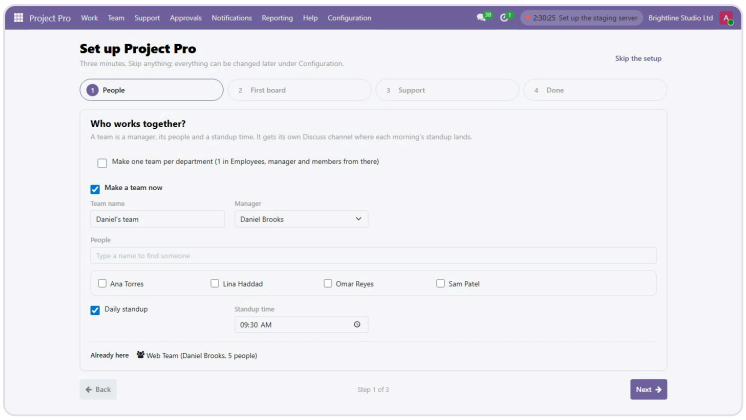

The settings, in order

#	What	Where	Default if you skip it
1	Users with Project access	Settings, Users (standard Odoo)	Only people with a login can be on a board or a team
2	A team: manager, members, standup time and days	Configuration, Teams	No standups; Home still shows My Day
3	The first board, from a template	Work, Boards, New project board	Every project gets a plain board with Not Started, Working on it, Stuck, Done
4	The recommended automations	Ticked in the New Project Board dialog	Starter recipes stay in draft and nothing fires
5	A support board, its alias and SLA hours	Set up wizard, or a board from the Support Desk template	No tickets
6	Approval rules	Approvals, Set up a rule	Nothing is held
7	Your own notification settings	Notifications, My Settings	Inbox and phone for every event, email for approval requests and overdue items
8	Timesheets app (optional)	Apps, Timesheets	No timer, no Spent column, no My Time
9	Web Push add-on (optional)	Apps, PWA Mobile App with Push Notifications	No phone notifications
10	Alias domain for ticket email	Settings, Discuss, alias domain (standard Odoo)	Tickets come in by web form only

On install, the module seeds the nine board templates and seven starter automations (all in draft), gives every existing project a board with the starter statuses, and creates notification settings for each person the first time they are needed. Pressing **Set up a board for every project** on the Boards screen again never makes duplicates.

Set up in three minutes MANAGERS

Help, then **Set up in three minutes** (also on Home and in Ctrl+K). Four steps across the top: the people, the first board, support, done. Every step can be skipped, **nothing is written until Finish**, and running it a second time updates what it made before instead of duplicating it. **Skip the setup** at the top hides it from Home without creating anything.

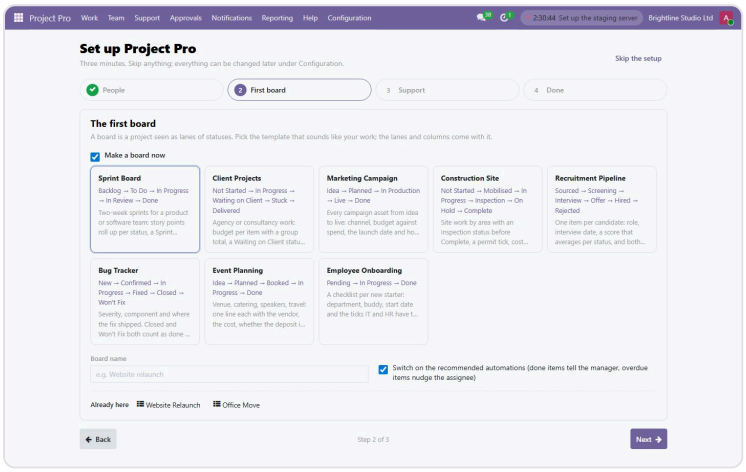

1

Who works together?

Either **Make one team per department** (when Employees is installed: the department manager and members come from there) or **Make a team now**: a team name, a manager, tick the people, and the daily standup time. Teams that already exist are listed under **Already here**.

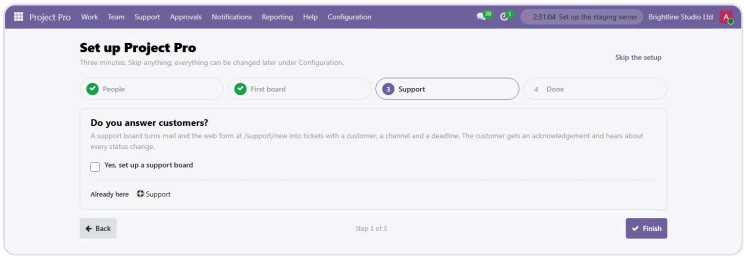

A person needs a login to appear in the list.

2

The first board

Make a board now, pick the template that sounds like your work (the lanes and columns come with it), give the board a name and leave **Switch on the recommended automations** ticked.

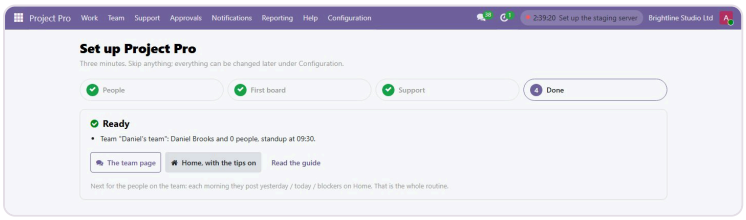

3

Do you answer customers?

Yes, set up a support board: a board name, the email alias that turns mail into tickets, and **Answer within (hours)**, the SLA. Tick **The team from step 1 handles support** to put it on the same team.

The alias receives mail only once an alias domain is set under Settings, Discuss.

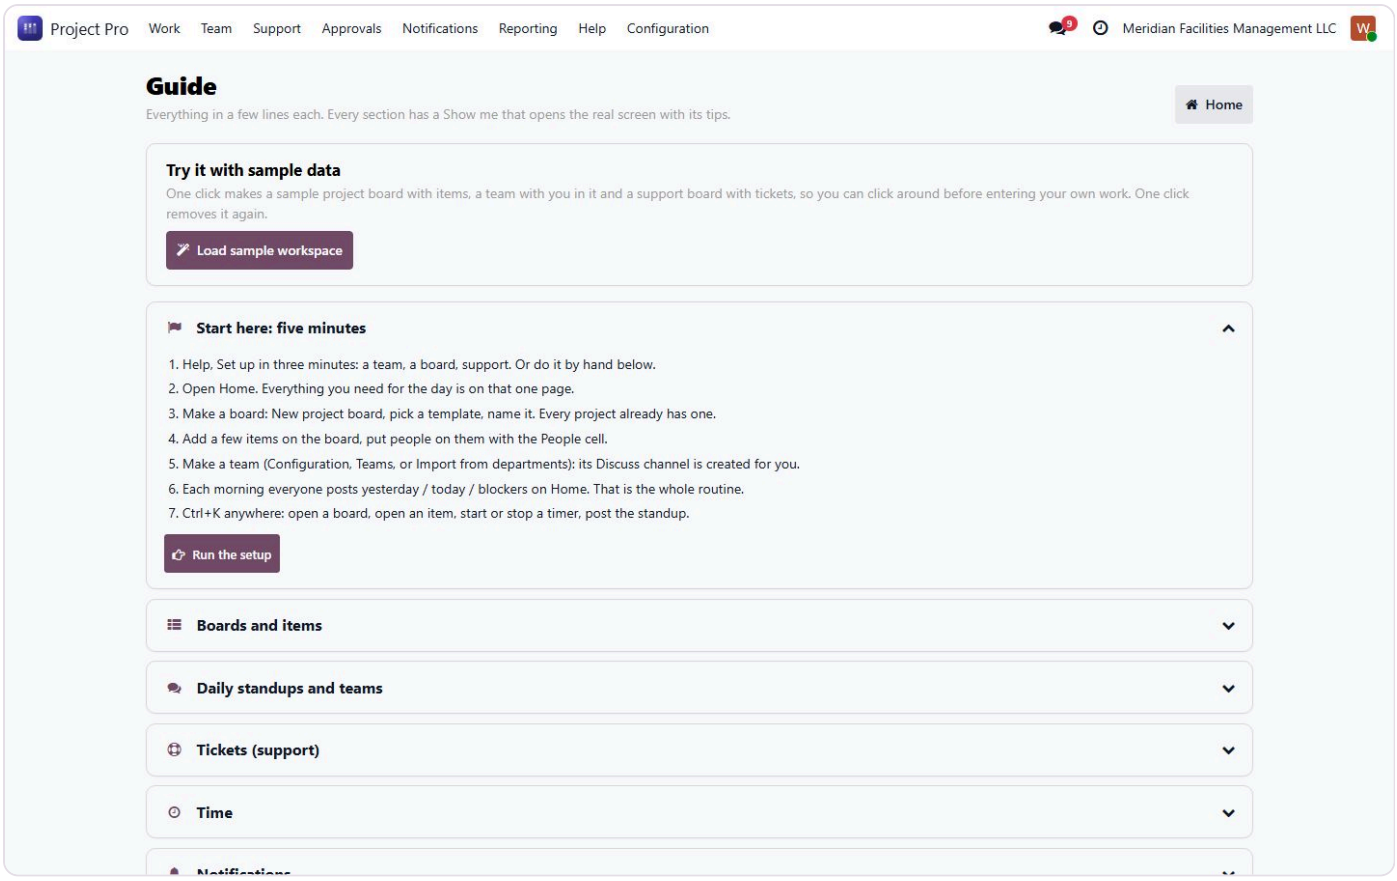

4

Ready

Press **Finish**. The last step lists what was made, with an **Open** button for each board, a link to the team page, Home with the tips on, and the guide. If you skipped everything it says so: nothing was created.

The sample workspace

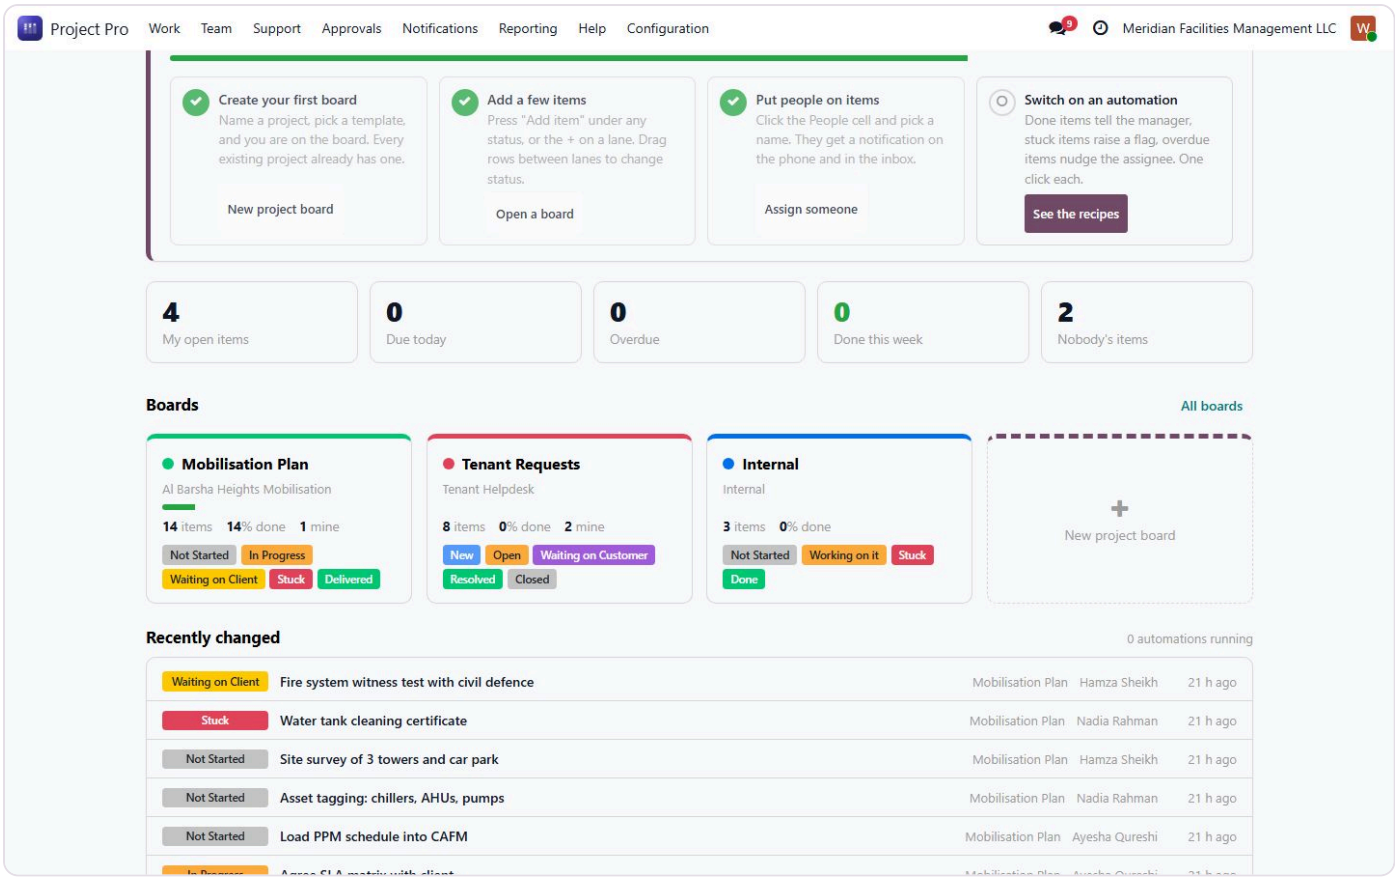

Help, Guide, **Try it with sample data**, then **Load sample workspace** (managers). One click makes a project board from the Sprint template with eight items across the lanes, a team with you in it, and a support board with three tickets from sample customers, so a new team can click around before typing its own work. **Remove sample data** deletes exactly what it made and nothing else.

Help, Guide: one section per thing a company does (Start here, Boards and items, Daily standups and teams, Tickets, Time, Notifications, Approvals, Automations), a few lines each. **Show me** opens the real screen with its tips switched on.

The checklist on Home

Until it is hidden, Home carries **Set up in four steps**: a board exists, items exist, people are on them, an automation runs. Each step ticks itself off as soon as it is true. Its buttons open the setup wizard or the sample data, and **Hide** puts it away for you.

The lower half of Home: your teams today with posted over expected, the four-step checklist with Set up in three minutes and Try with sample data, then the boards.

PART 5 Teams and the daily standup

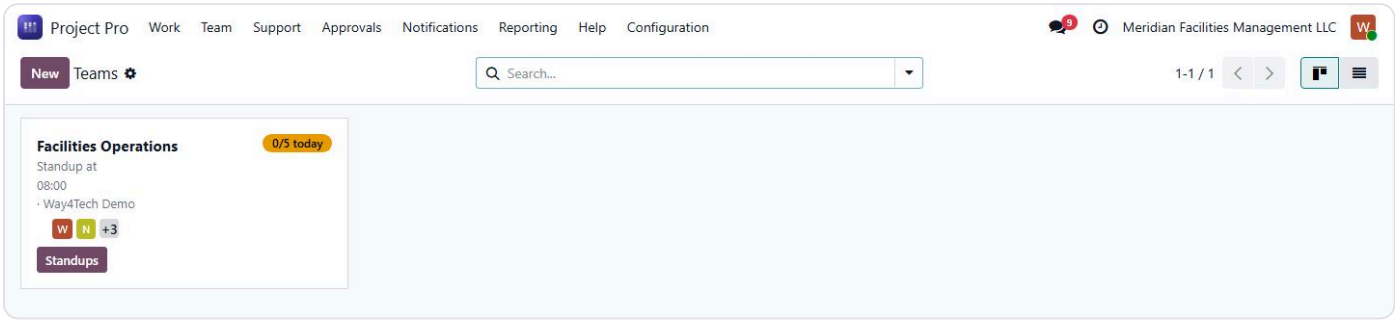

A team is a manager, its people, a standup time and the days it applies. It gets its own Discuss channel, kept in step with the member list, where every standup lands as a message from its author.

IN THIS PART YOU WILL LEARN

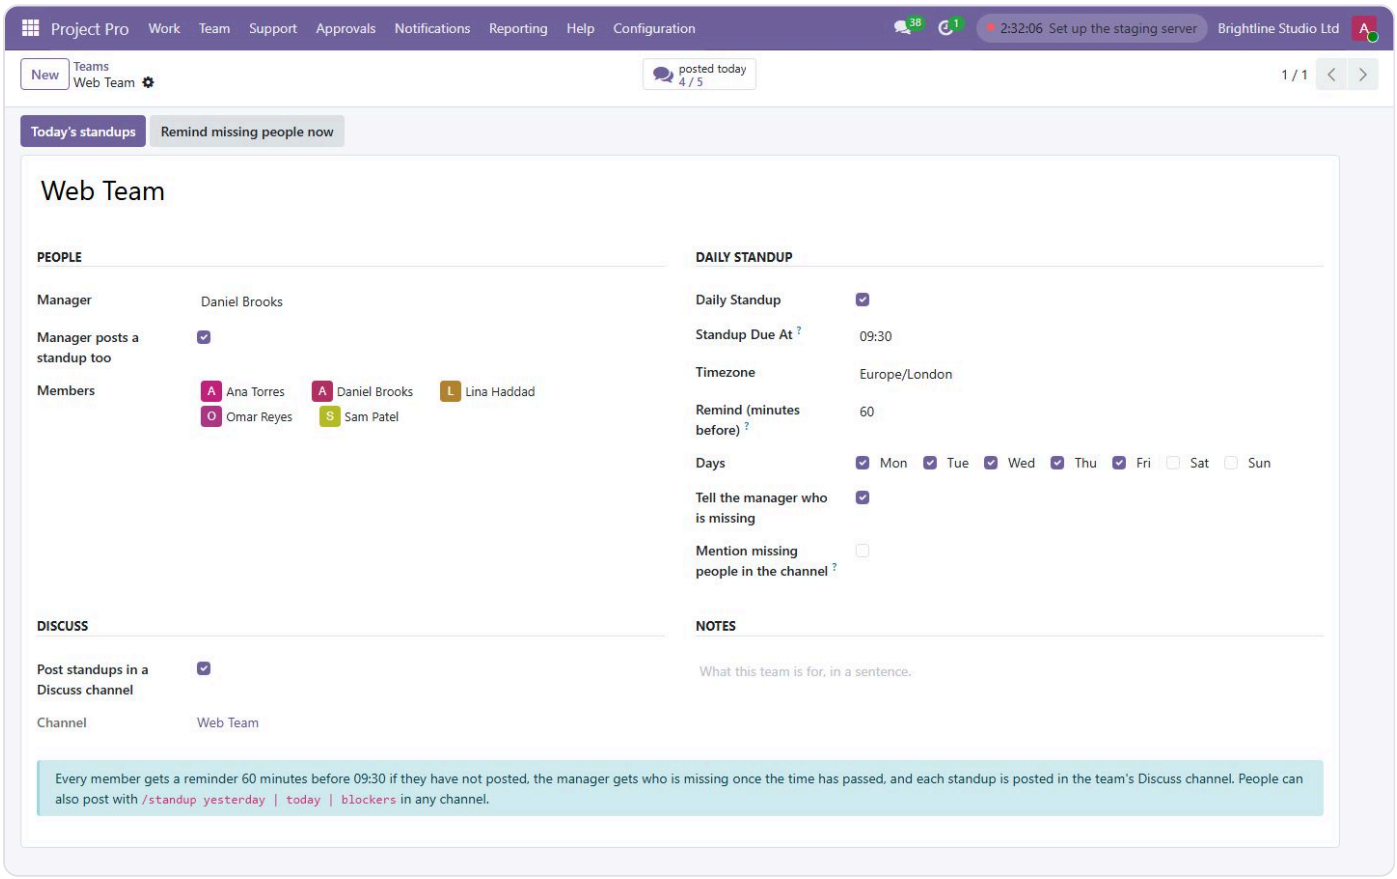

- Every field on the team form
- Reminders before the standup and the manager's summary after it
- Building teams from Employees departments

TRY IT YOURSELF ON THE DEMO

1. Open Configuration, Teams, and open Facilities Operations
2. Read the standup time, the days and the Discuss channel

Configuration, Teams: each team as a card with its colour, how many have posted today out of how many expected, the standup time and the manager. The icon opens today's standups.

A team. Across the top: **Today's standups** and **Remind missing people now**; the smart button shows how many posted today.

Field	What it does
Manager	Receives the summary, the blockers and, if switched on, a note when each person posts

Manager posts a standup too	Counts the manager among those expected to post
Members	The people expected to post. Joining or leaving updates the Discuss channel
Daily Standup	Switches the routine on for this team
Standup Due At, Timezone	The time of day, read in the team's own timezone
Remind (minutes before)	When people who have not posted get the reminder
Mon ... Sun	The days the standup applies. Nobody is chased on the other days
Tell the manager who is missing	After the time passes, the manager gets "5 of 7 posted, still missing ..."
Mention missing people in the channel	Adds an @mention of each missing person in the channel
Post standups in a Discuss channel	Posts each standup in the team channel
Channel	The channel itself, created and kept in step by the team
Notes	Free text for the team

Teams from departments USES EMPLOYEES

With the Employees app installed, the **Import from departments** action (in the Action menu of the Teams list or kanban, and the first step of the setup wizard) builds one team per department, the department manager as manager and its employees with a login as members. Running it again updates the same teams.

How the reminders run

A job runs every ten minutes, in each team's timezone. Before the standup time, everyone who has not posted gets a reminder, once. Once the time has passed, the manager gets one summary of who posted and who is still missing. **Out today** counts as excused. A blocker reaches the manager the moment it is posted. All of it goes through the notification engine, so each person's channels, quiet hours and mutes apply.

PART 6 Board templates and starting a board

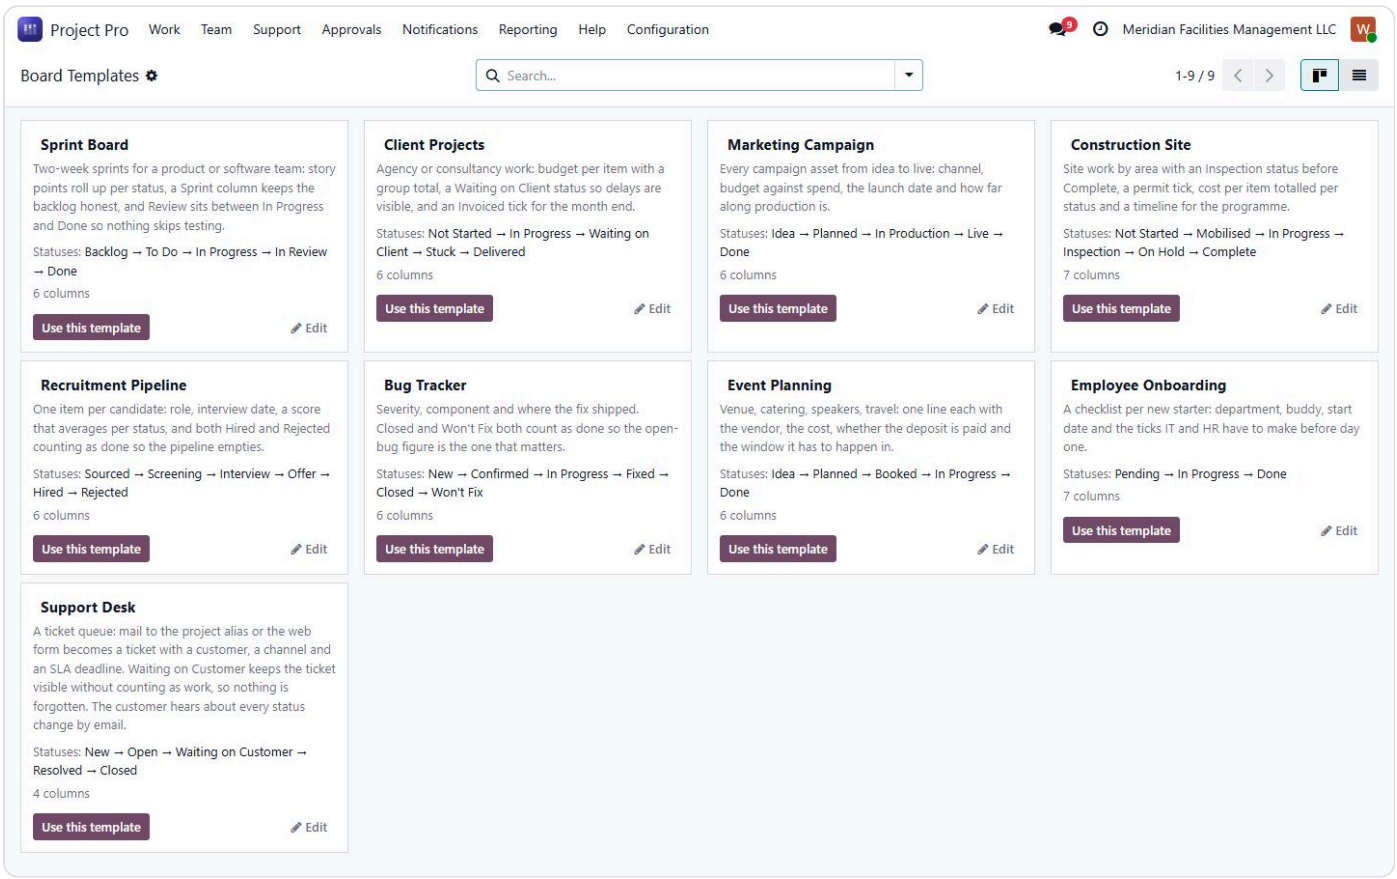

Nine templates ship with the module, each with its own statuses, colours, done flags and columns. One dialog starts a new project on a template, or adds a board to a project you already have.

IN THIS PART YOU WILL LEARN

- The nine templates and their statuses
- The New Project Board dialog, field by field
- A board for every project in one click
- Saving a board of your own as a template

TRY IT YOURSELF ON THE DEMO

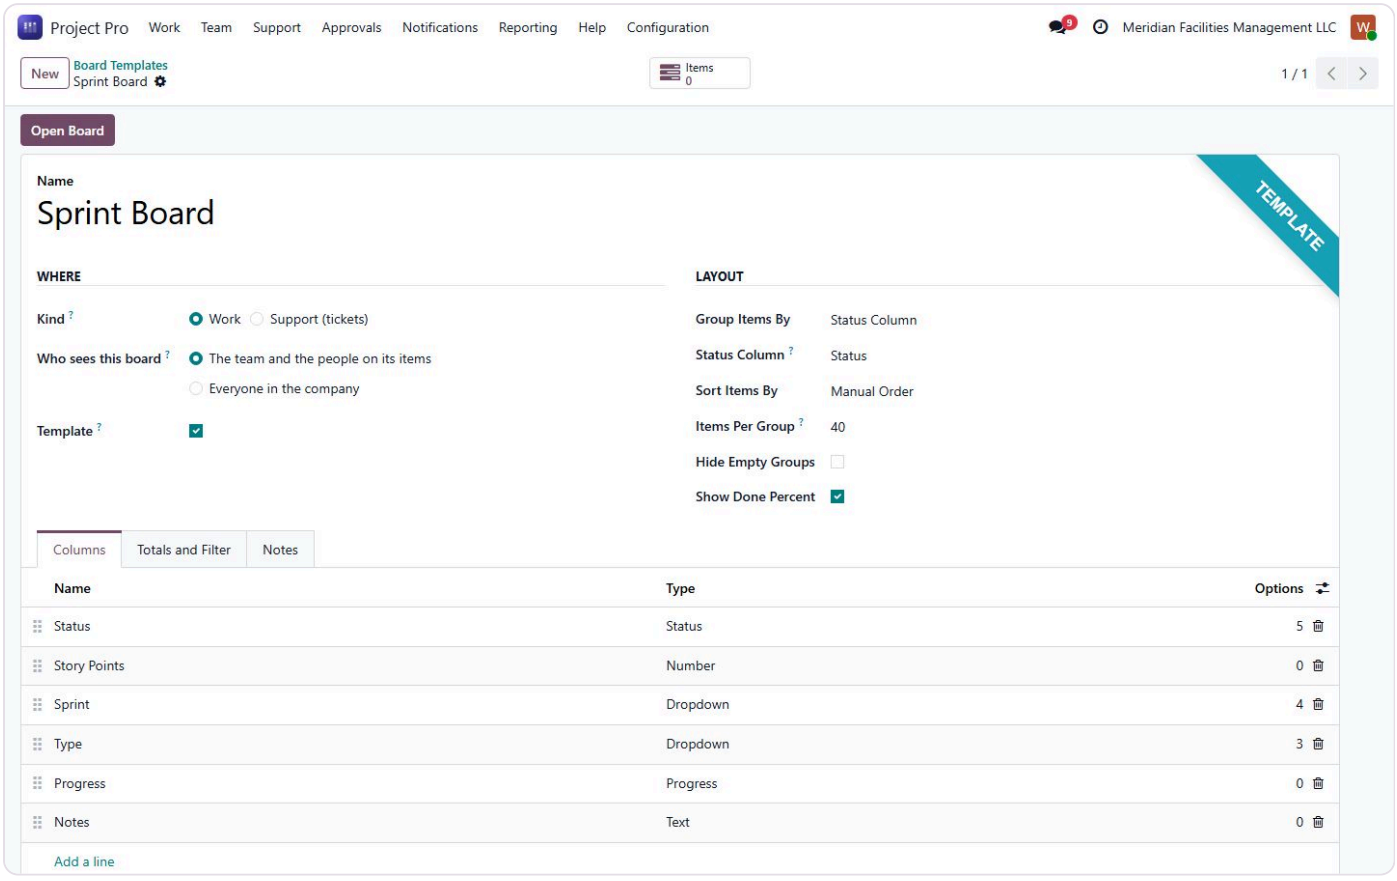

1. Open Configuration, Board Templates, and read the statuses on each card
2. Open Work, Boards, press New project board and look at the dialog (then Cancel)

Configuration, Board Templates. Each card shows the template's statuses in order, its description and how many columns it brings. The button on a card opens the New Project Board dialog with that template already picked.

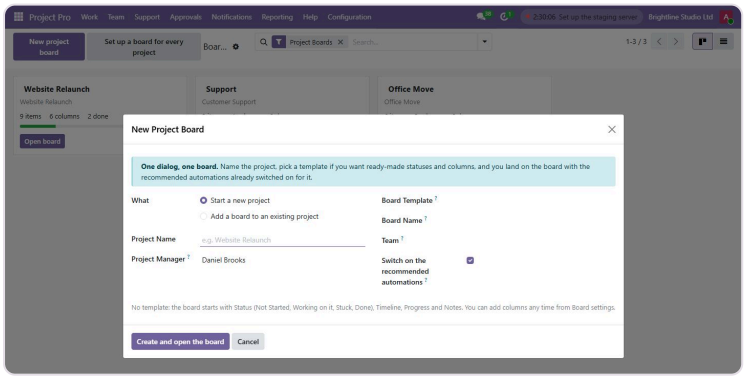

Template	Statuses (done in bold)	Columns it brings
Sprint Board	Backlog, To Do, In Progress, In Review, **Done**	Story Points (sum), Sprint, Type, Progress, Notes
Client Projects	Not Started, In Progress, Waiting on Client, Stuck, **Delivered**	Budget (sum), Client Priority, Timeline, Invoiced, Notes
Marketing Campaign	Idea, Planned, In Production, Live, **Done**	Channel, Budget, Spend, Launch Date, Progress
Construction Site	Not Started, Mobilised, In Progress, Inspection, On Hold, **Complete**	Site Area, Timeline, Progress, Cost, Permit Cleared, Site Notes
Recruitment Pipeline	Sourced, Screening, Interview, Offer, **Hired**, **Rejected**	Role, Score, Interview Date, Recruiter, Notes
Bug Tracker	New, Confirmed, In Progress, Fixed, **Closed**	Severity, Component, Reported On, Fixed In, Progress

Event Planning	Idea, Planned, Booked, In Progress, **Done**	Vendor, Cost (sum), Deposit Paid, Event Timeline, Owner
Employee Onboarding	Pending, In Progress, **Done**	Department, Buddy, Start Date, Laptop Issued, Accounts Created, Progress
Support Desk	New, Open, Waiting on Customer, **Resolved**, **Closed**	Type, Product, Notes; makes a board of kind Support

A template is an ordinary board record with **Template** ticked and no project. Its columns and options are the ones every new board copies.

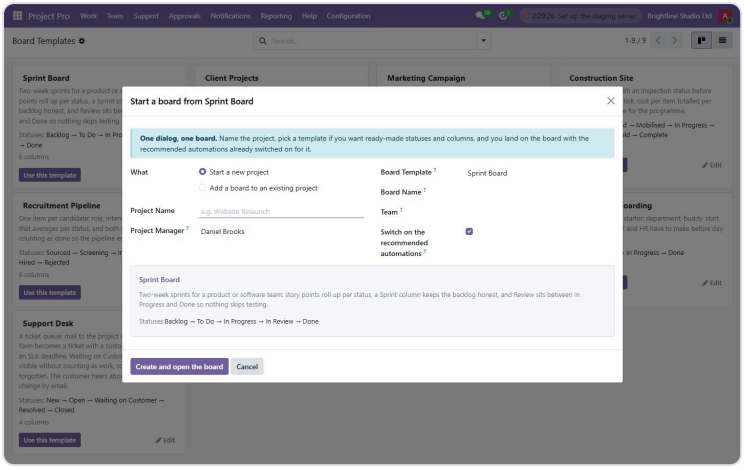

Start a board MANAGERS

1

New project board

Work, Boards, **New project board**. **What: Start a new project** (type the project name and pick a project manager) or **Add a board to an existing project** (pick the project).

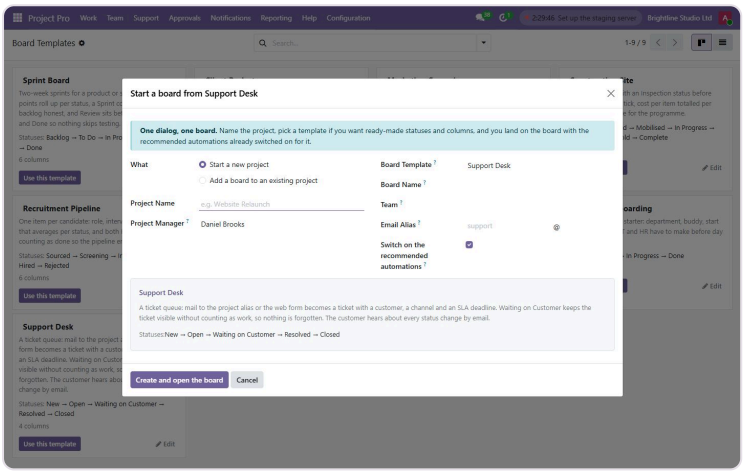

2

Pick the template

Pick a **Board Template**; the dialog shows **About this template** and its **Statuses**. Give it a **Board Name**, a **Team** if you have one, and keep **Switch on the recommended automations** ticked.

Ticked, three recipes are copied for this project only and switched on: tell people when they are put on a card, done items tell the board manager, stuck items raise a flag.

3

A support board

With Support Desk picked, the dialog also asks for the **Email Alias**. The board is of kind Support, and the support recipe **Tickets due today raise a flag** is switched on as well.

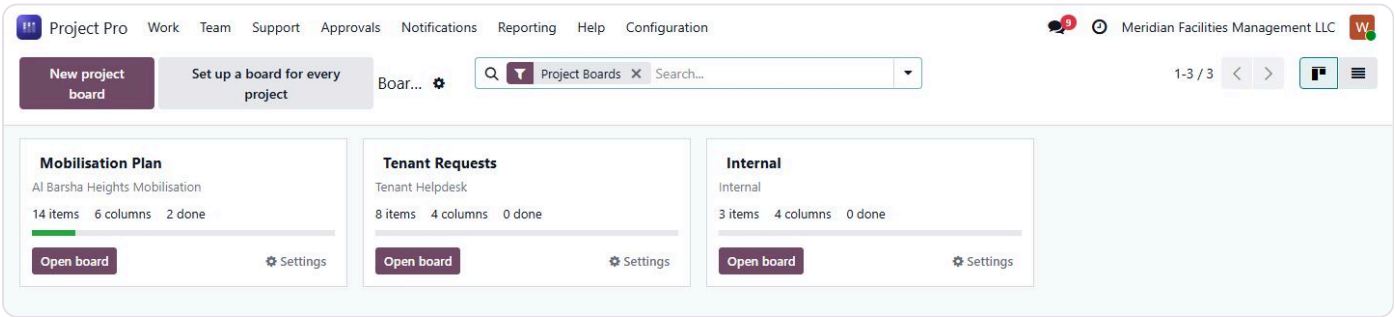

Press **Create and open the board** and you land on it. The first board made on a project becomes its default.

A board for every project MANAGERS

Work, Boards, **Set up a board for every project** gives every project that has none a board with the starter statuses (Not Started, Working on it, Stuck, Done). Pressing it twice creates nothing new.

Your own template

On any board's settings, **Save as Template** copies its configuration (statuses, colours, done flags, columns, options) into a new template with no project and no items. A board made from it points at its own copied columns, never at the source.

Work, Boards: the work boards you can see, each card with its accent colour, project, item count, column count and done percentage. Click a card to open the board.

PART 7 Board settings and columns

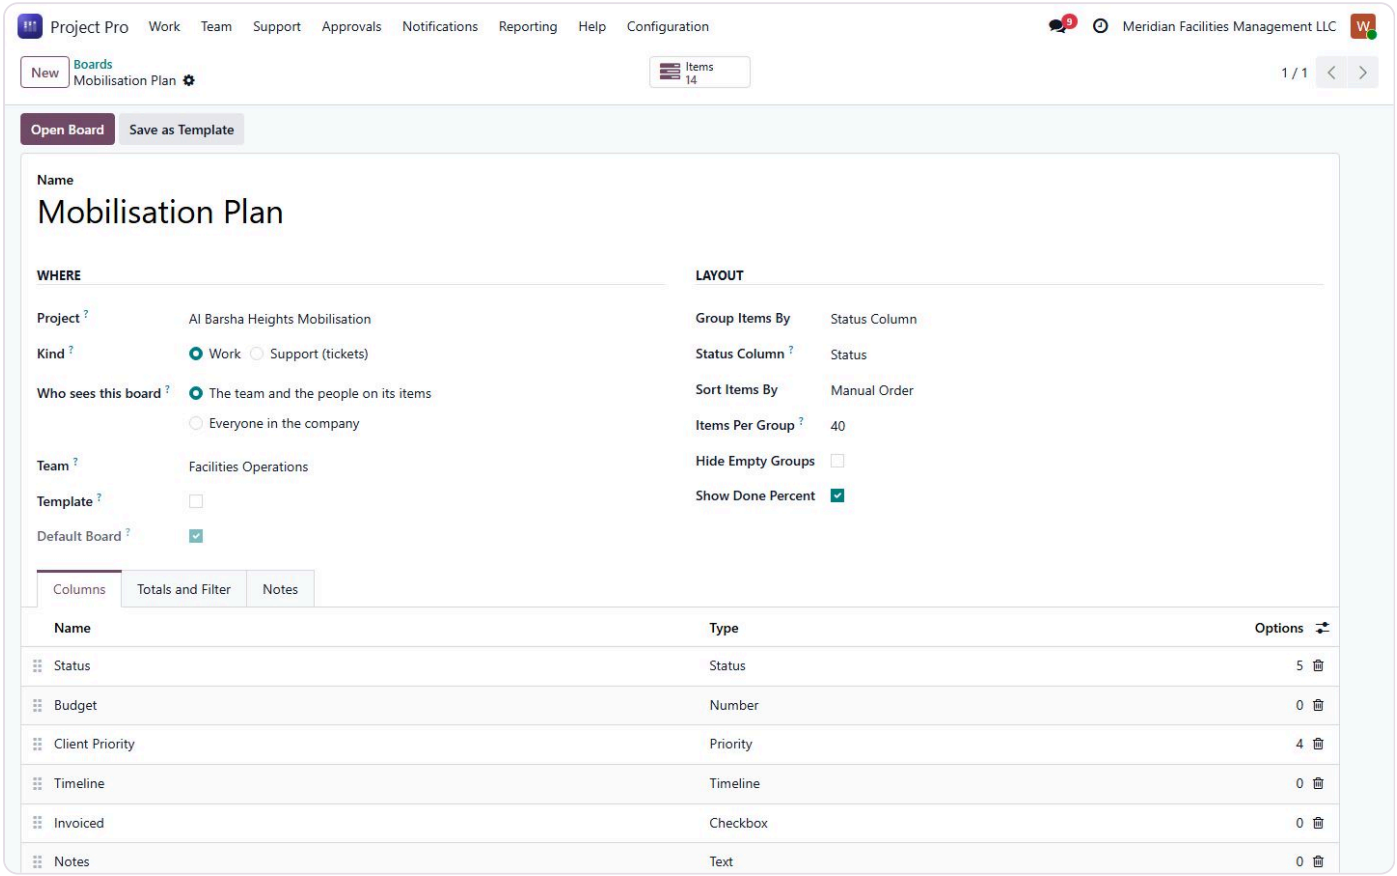

Every board is a record with its own layout, its columns and, for a support board, its service level. Board settings is one button away on the board itself.

IN THIS PART YOU WILL LEARN

- Every field on the board settings form, tab by tab
- The ten column types and how each one is edited
- Status options: colour, order and which count as done
- Group totals and the board filter

TRY IT YOURSELF ON THE DEMO

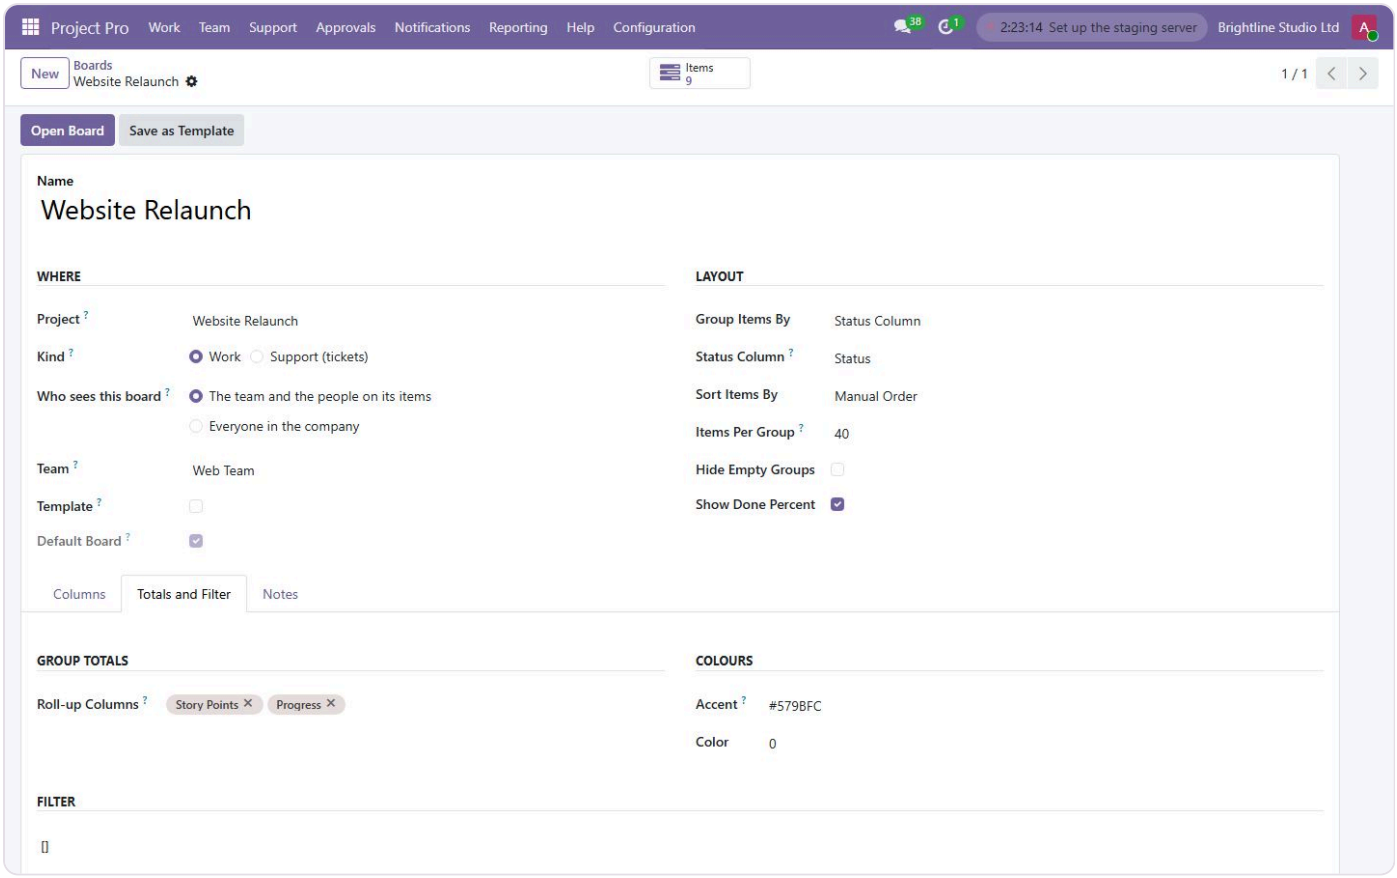

1. Open a board and press Board settings
2. Open the Columns tab, then open the Status column and read its options

Board settings for Mobilisation Plan. Header buttons: **Open Board**, **Add Starter Columns**, **Make Default**, **Save as Template**; the smart button counts the items.

Field	What it does
Project	The project whose tasks this board shows
Kind	**Work** or **Support (tickets)**. A support board adds the ticket fields and the Support tab
Who sees this board	The team and the people on its items, or everyone in the company
Team	The team that works the board; its members see it
Template, Default Board	Template boards have no project. A project has one default board, where new tasks land
Group Items By	Status Column, Project Stage, Assignee, Priority or No Grouping
Status Column	The column whose options are the lanes
Sort Items By	Manual Order, Deadline, Priority, Name or Newest First
Items Per Group	How many rows each lane loads before Load more (40 by default, at most 200)

Hide empty groups, Show done percent	Display switches

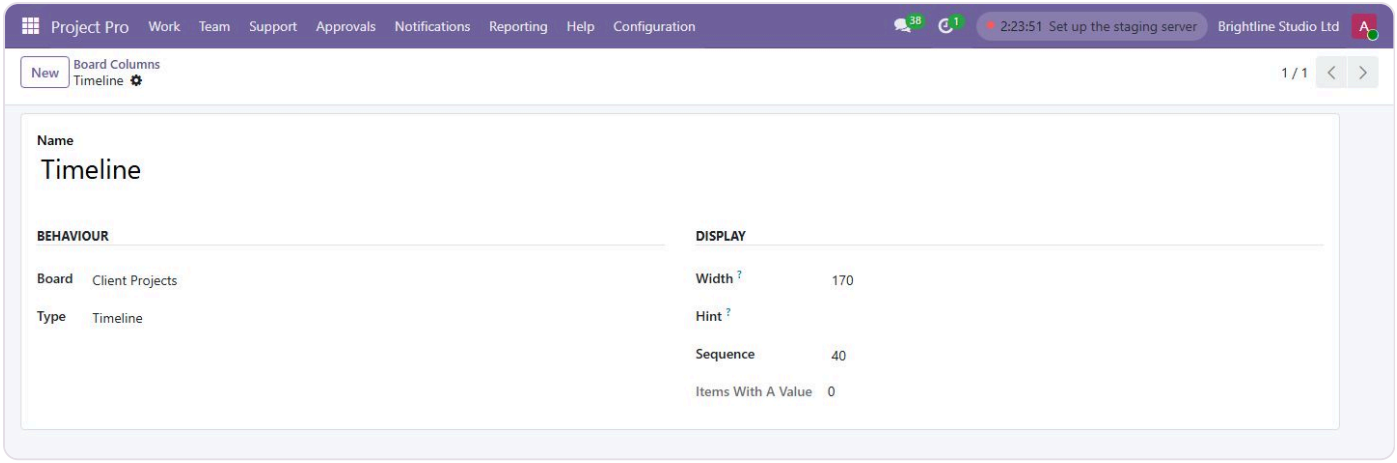

The **Totals and Filter** tab: **Roll-up Columns** whose totals show under each group, the board's accent and kanban colours, and a **Filter** that narrows which of the project's tasks appear on the board.

Column types

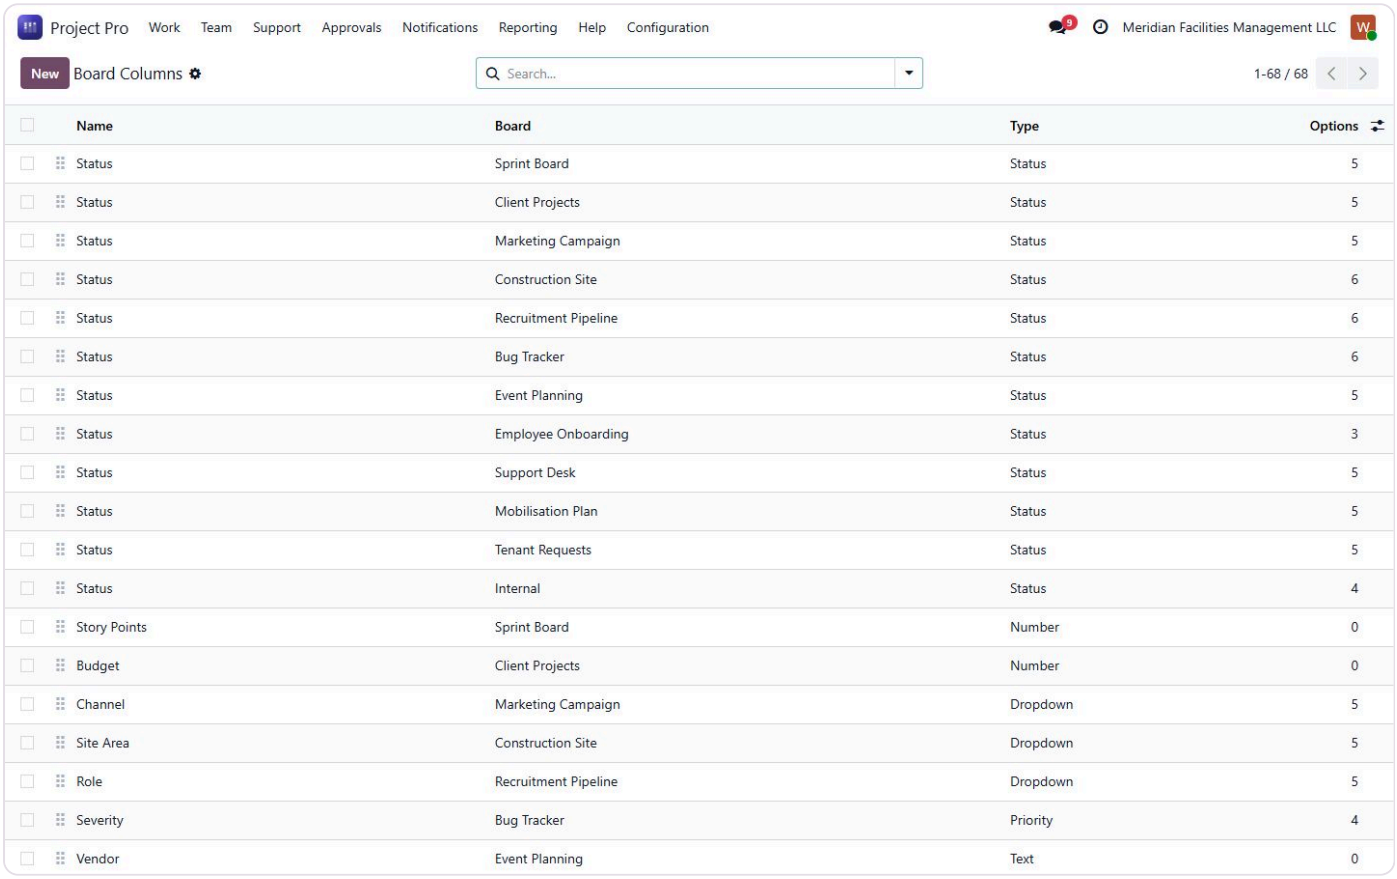

Type	On the board	Edited by
Status	A coloured pill; its options are the lanes	Picking from the board's statuses
People	Faces	Picking names
Date	A date	A date picker
Timeline	A start and an end	Two dates; the end cannot be before the start
Number	A number with Sum, Average, Minimum or Maximum under each group	Typing a number
Progress	A bar, averaged under each group	Typing a percentage, 0 to 100
Text	Text	Typing
Dropdown	A pill in the option's colour	Picking an option
Checkbox	A tick box	One click
Priority	Stars	One click

A value is stored only once somebody types one, so a large project with ten columns does not become ten rows per task. An item nobody has touched sits in the first status without a value being written. A column's type is locked once items carry values, and an option from another column or a column from another board is refused.

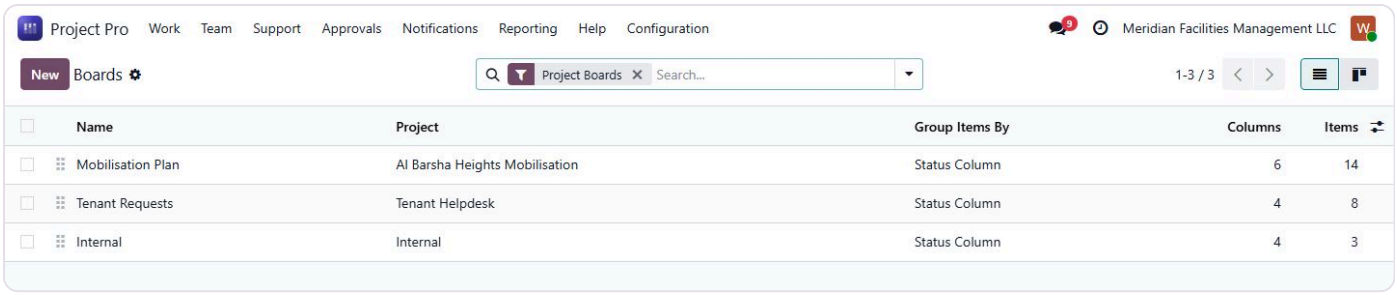

A column: its board, type and roll-up, width and hint, and for a status or dropdown the **Options** with their colour (exact hex colour and kanban colour), order and **Counts as Done**, plus the default option.

> More than one status can count as done. A team that treats Done and Cancelled as off its plate gets an honest done percentage on the Boards screen.

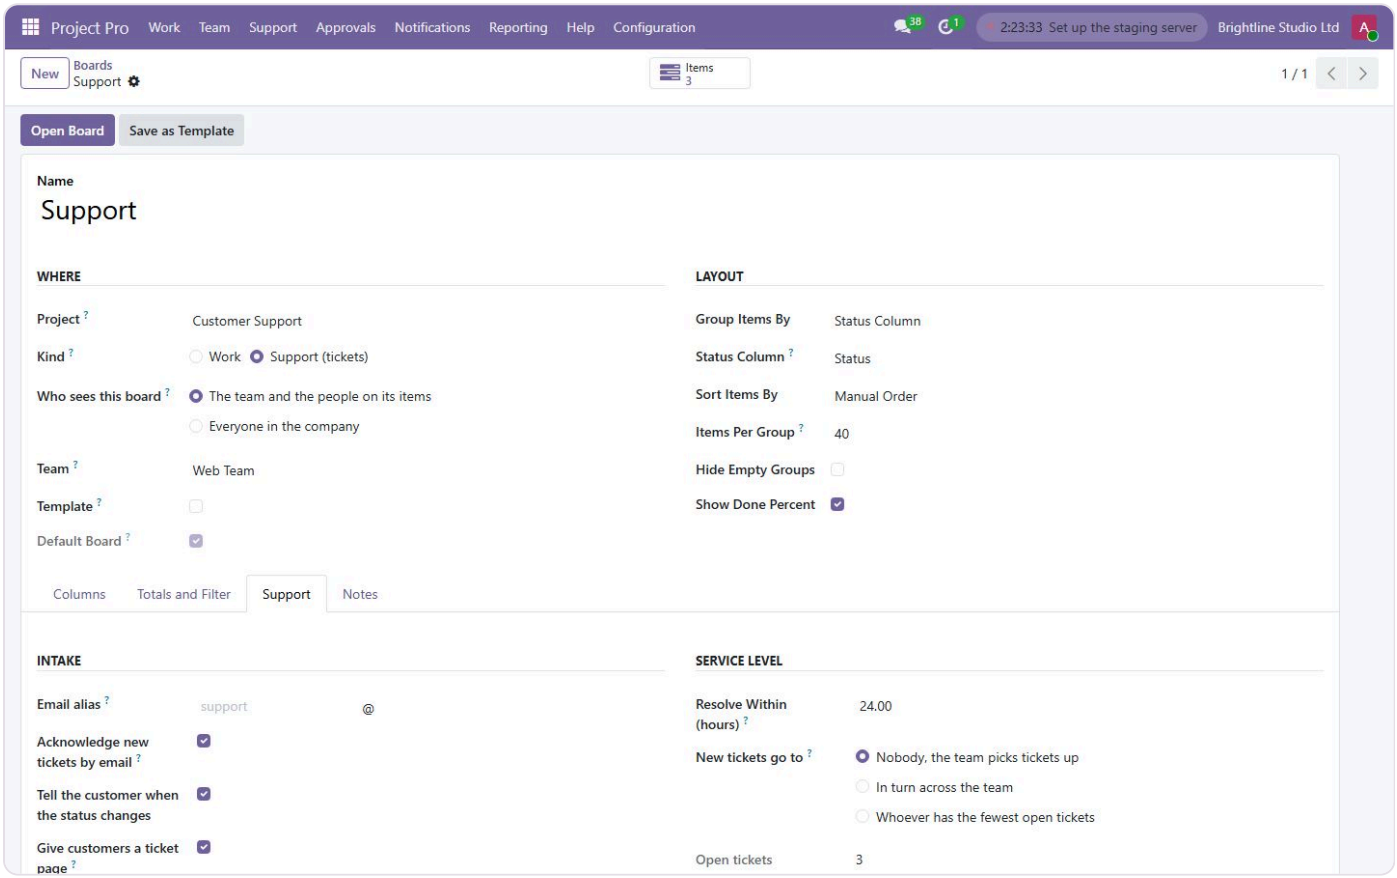

Configuration, Columns: every column on every board, with its type, option count, how many items hold a value, the roll-up and the width.

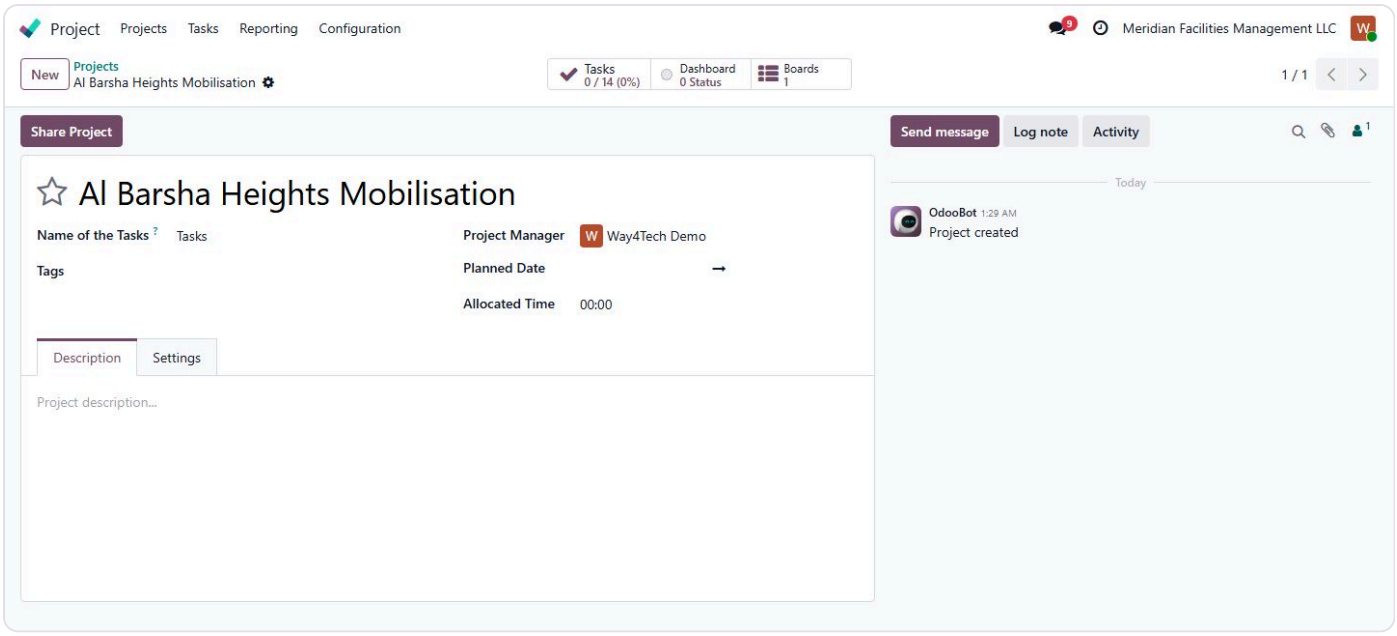

Configuration, Board Settings: every board record, templates included, with grouping, columns, items, done percentage and the default and template flags.

The Support tab

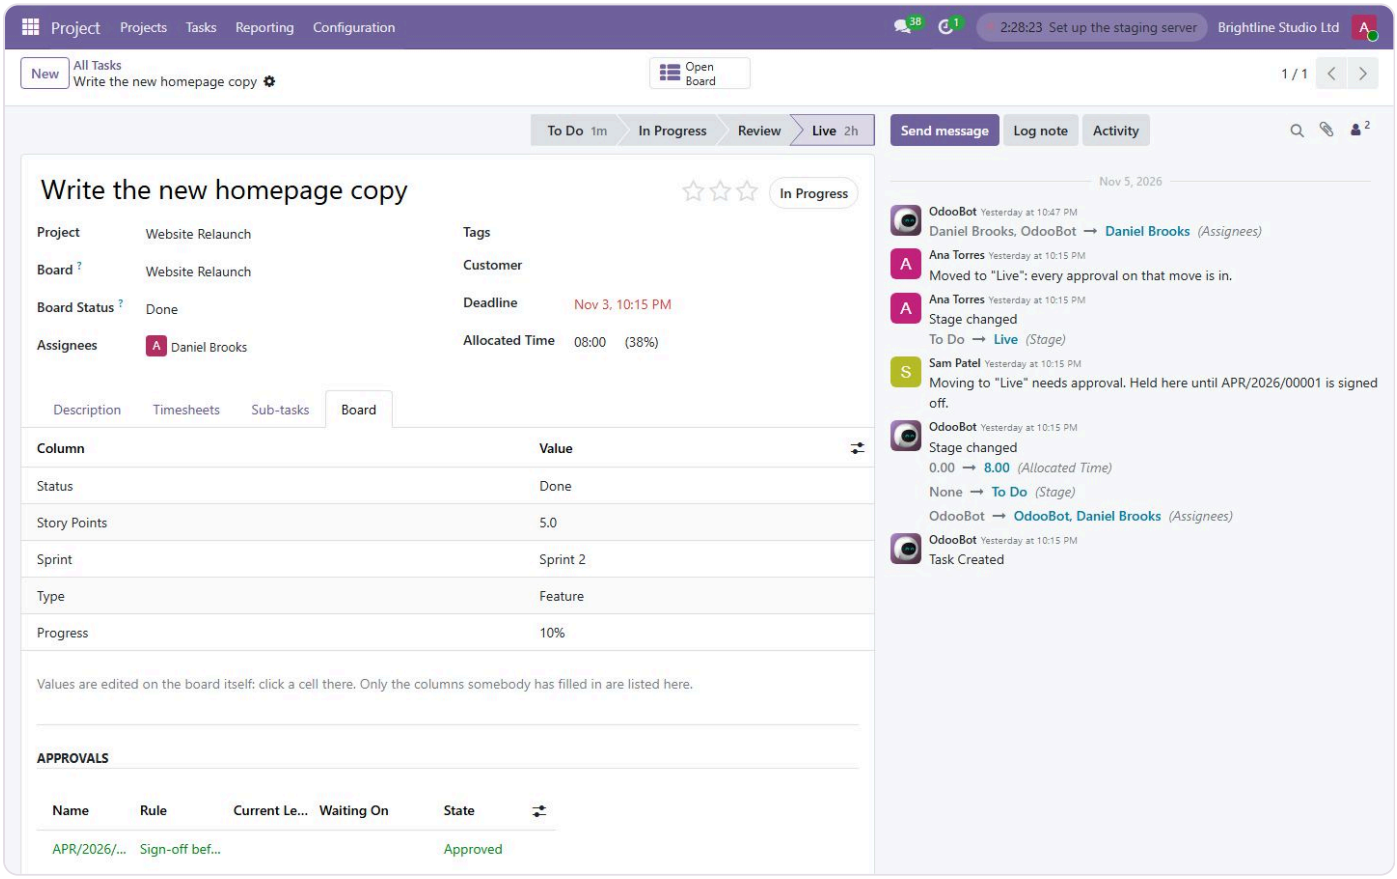

On a support board: **Intake** (email alias, acknowledge new tickets by email, tell the customer when the status changes, give customers a ticket page, signature on customer mail) and **Service level** (resolve within so many hours, who new tickets go to, the last person assigned, open tickets and how many are past their SLA).

On the project and the task

The standard project form gains a **Boards** smart button, and the menu on each project card in the Project app gains a **Board** entry.

The standard task form shows the board, its status column and the **Board Status** as a dropdown, an Open Board button, and the board's values read-only on a **Board** tab. Custom columns are edited on the board.

PART 8 Working on a board

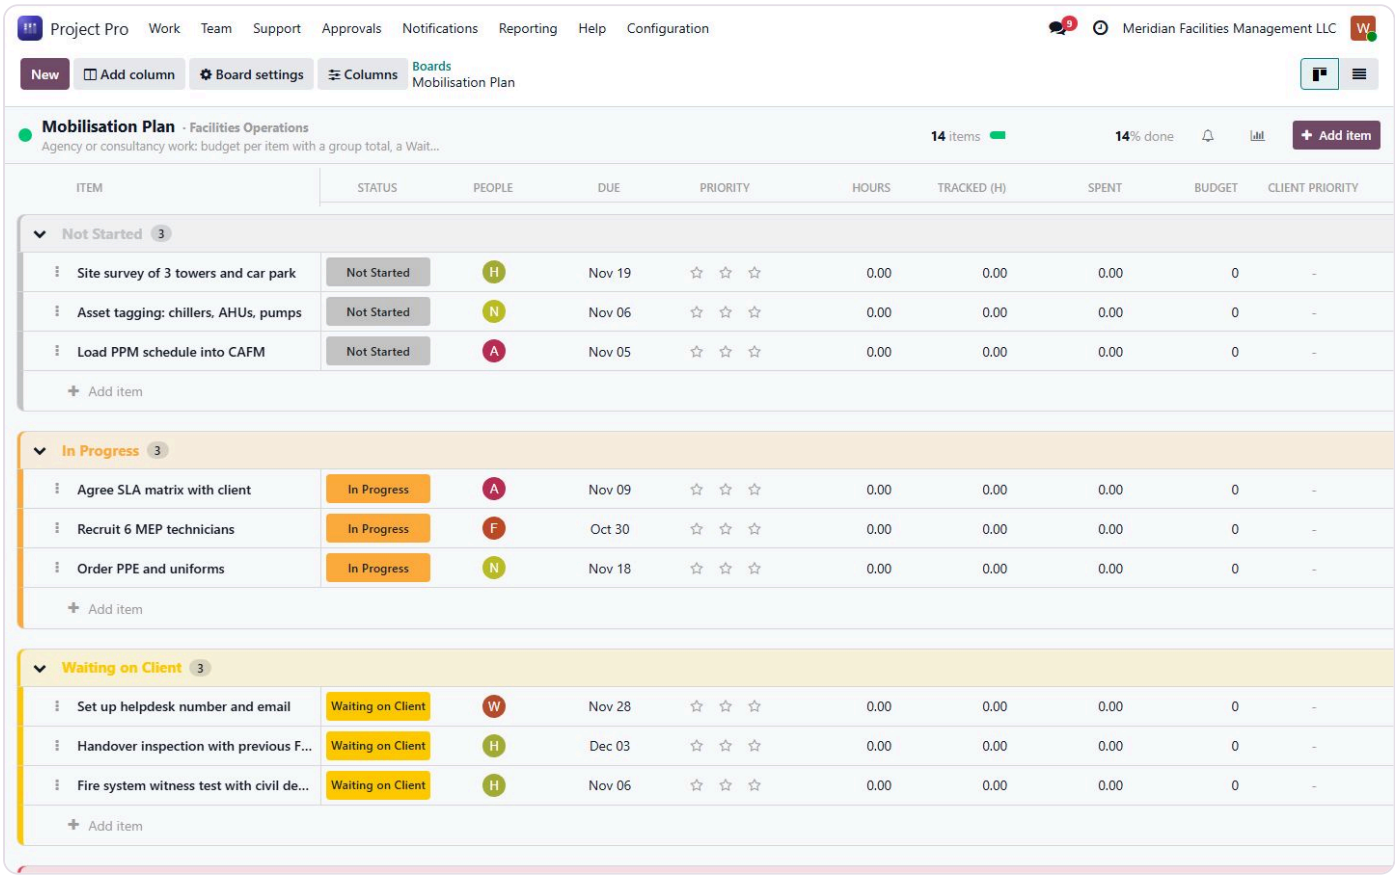

The board is a real Odoo view type, so it sits in the view switcher next to the list. Rows are tasks, lanes are statuses, and every cell is edited with a click. Dragging a row into another lane changes its status, and the task's own rules, the approval hold included, are in the path of every move.

IN THIS PART YOU WILL LEARN

- Reading a board: the strip, the lanes, the columns, the totals
- Changing a status, editing a cell, adding an item
- Selecting many rows and acting once
- Grouping, loading more, and the overview chart
- All Items: every board in one view

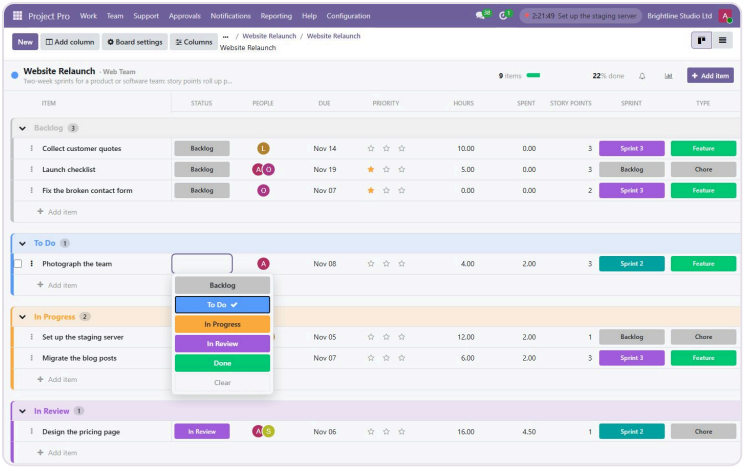

TRY IT YOURSELF ON THE DEMO

1. Open Work, Boards, then the Mobilisation Plan card
2. Press Columns and look at which columns can be hidden
3. Open Work, All Items and see the same rows grouped by project

Mobilisation Plan on the demo. The strip along the top carries the board's name, project, description, item count and done percentage, the mute bell, the overview chart and **Add item**. Lanes are the board's statuses, each in its colour, with the true item count on the header.

The first columns are the task's own fields: **Item**, **Status** (filling its cell in the status colour), **People**, **Due**, **Priority** and **Hours**; with Timesheets, **Spent**; on a support board, **Customer**, **SLA due**, **SLA** and **Channel**. Then come the board's own columns. On a wide board the item name stays put while the columns scroll sideways.

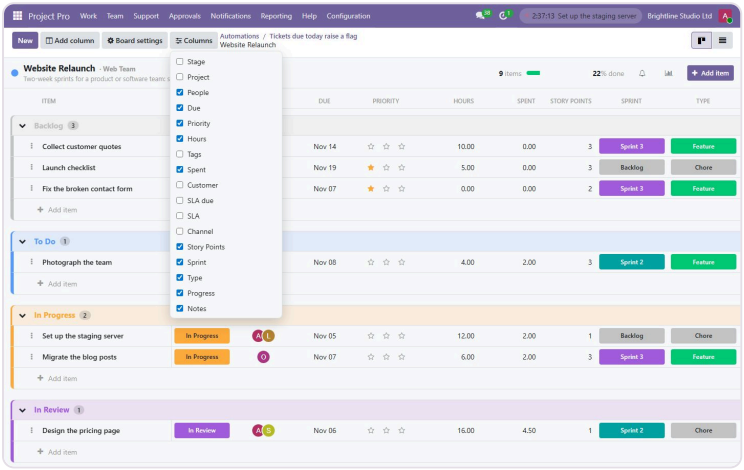

1

Change the status

Click the status pill. The board's statuses drop down in their colours; pick one and the row moves to that lane. Dragging the row by its handle does the same.

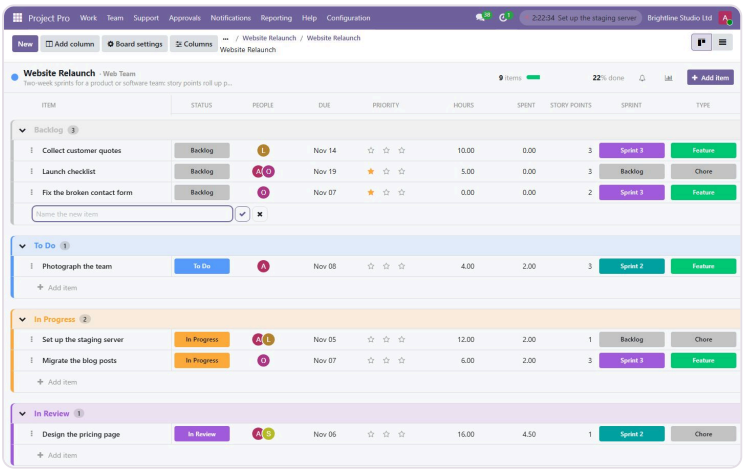

If an approval rule guards the move, the status change is held and the rest of what you changed is kept. See Part 15.

2

Show or hide columns

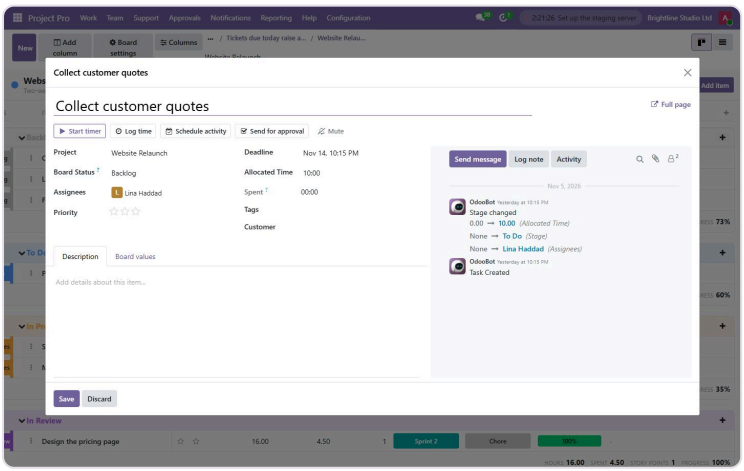

Columns in the control panel lists every column with a tick to show or hide it on this board. **Add column** (managers) adds one straight from the board.

3

Add an item into a lane

Each lane ends in an **Add item** row: type a name and press Enter, and the task is created straight into that lane, on this board and project. The plus on a lane header and Add item in the strip do the same.

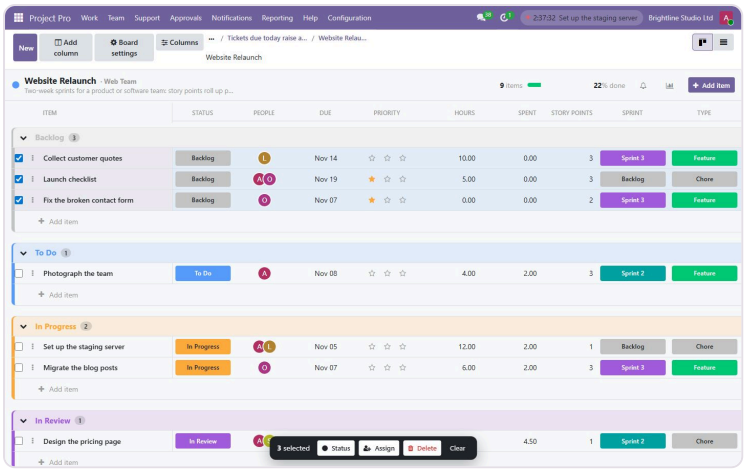

4

Open the item dialog

The expand icon at the end of a row opens a compact dialog: name, status, people, priority, deadline, hours, tags, customer, description and the board values, the comments beside it, and the row of verbs. **Full page** opens the item's own page.

A row with a conversation shows the comment count.

5

Select many, act once

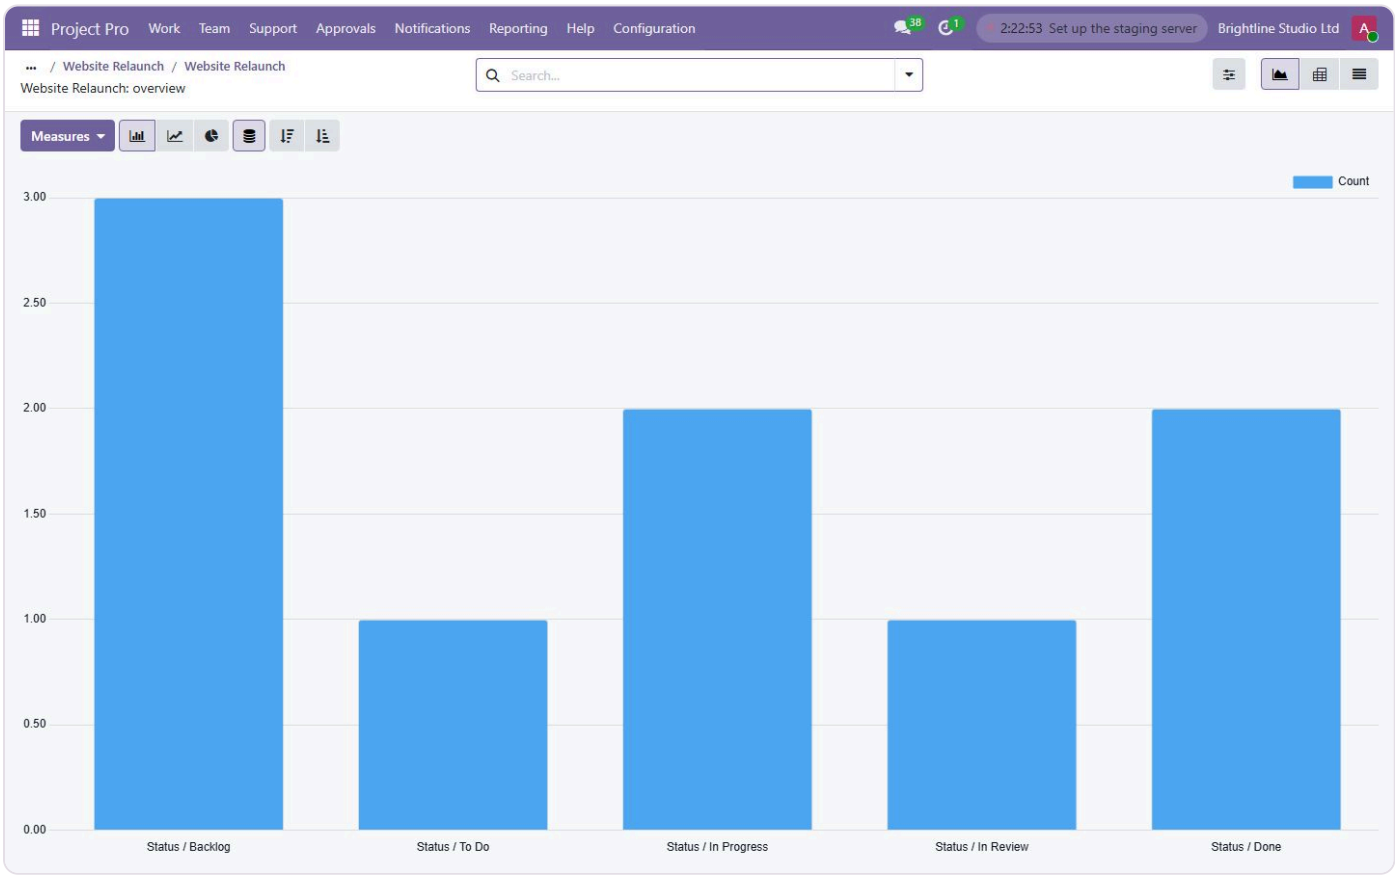

A checkbox appears on each row on hover. Tick a few and a bar appears: **Status** (the board's statuses as coloured buttons), **Assign** (a person to add to all of them), **Delete** (with a confirmation) and **Clear**.

Grouping

A board groups by its board status out of the box. **Group Items By** in Board settings changes that to the project stage, the assignee, the priority or no grouping. The list button at the top right switches the same items to a plain list, where Odoo's usual search, filters and Group By are at hand.

Totals, paging and order

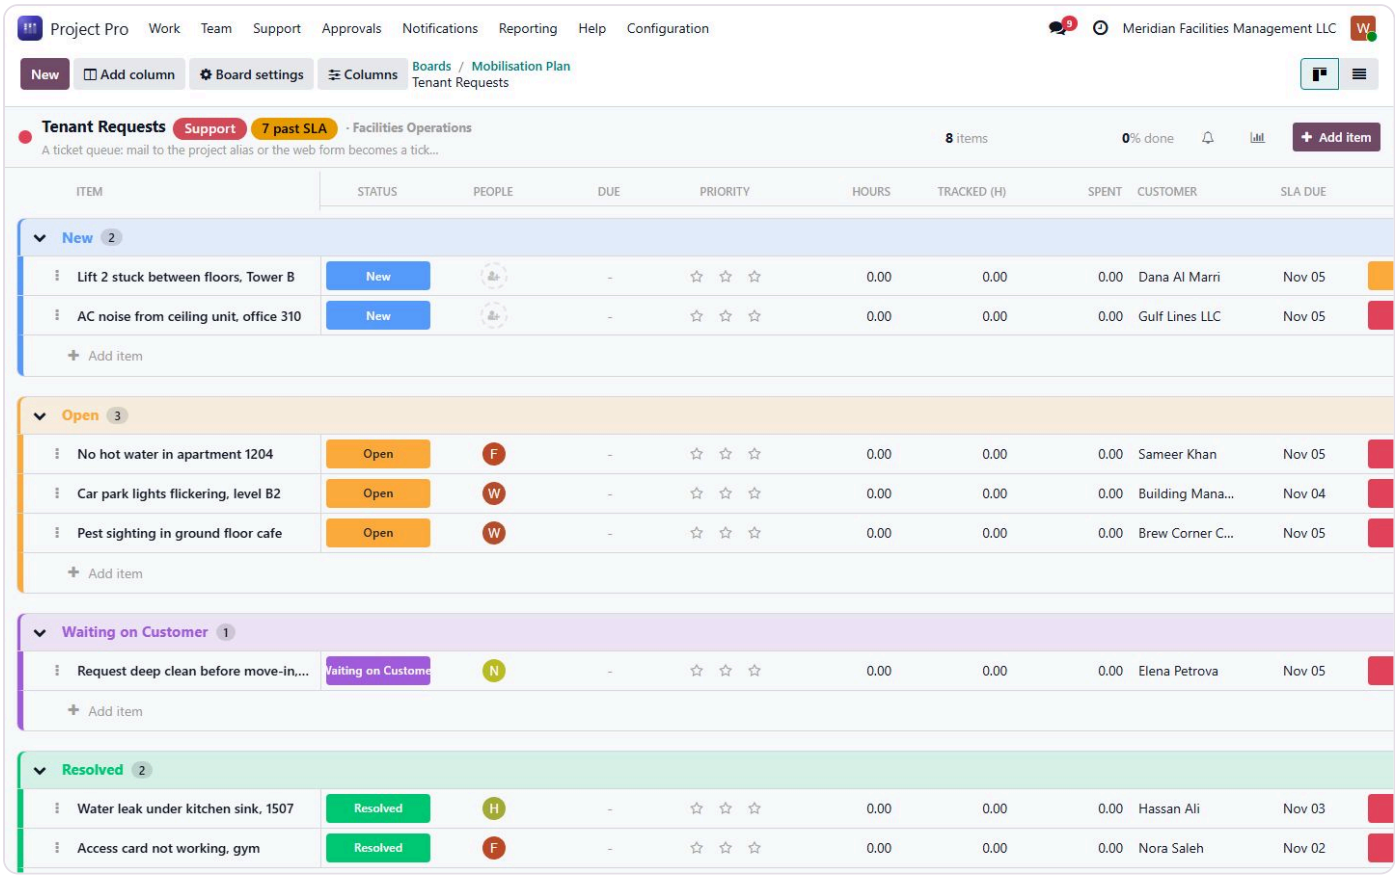

Under each lane sit the totals of the roll-up columns: the sum, average, minimum or maximum the column asks for, and the average of a progress bar. Each lane loads one page of rows (40 by default) and offers to load more; when a lane holds more rows than are loaded, its total carries a marker saying it is partial. Reordering rows inside a lane writes only the items whose position changed, and the board keeps that manual order.

The chart icon in the strip opens the board overview on the board's own items: a bar chart of items per status, a pivot of status by person, and the list.

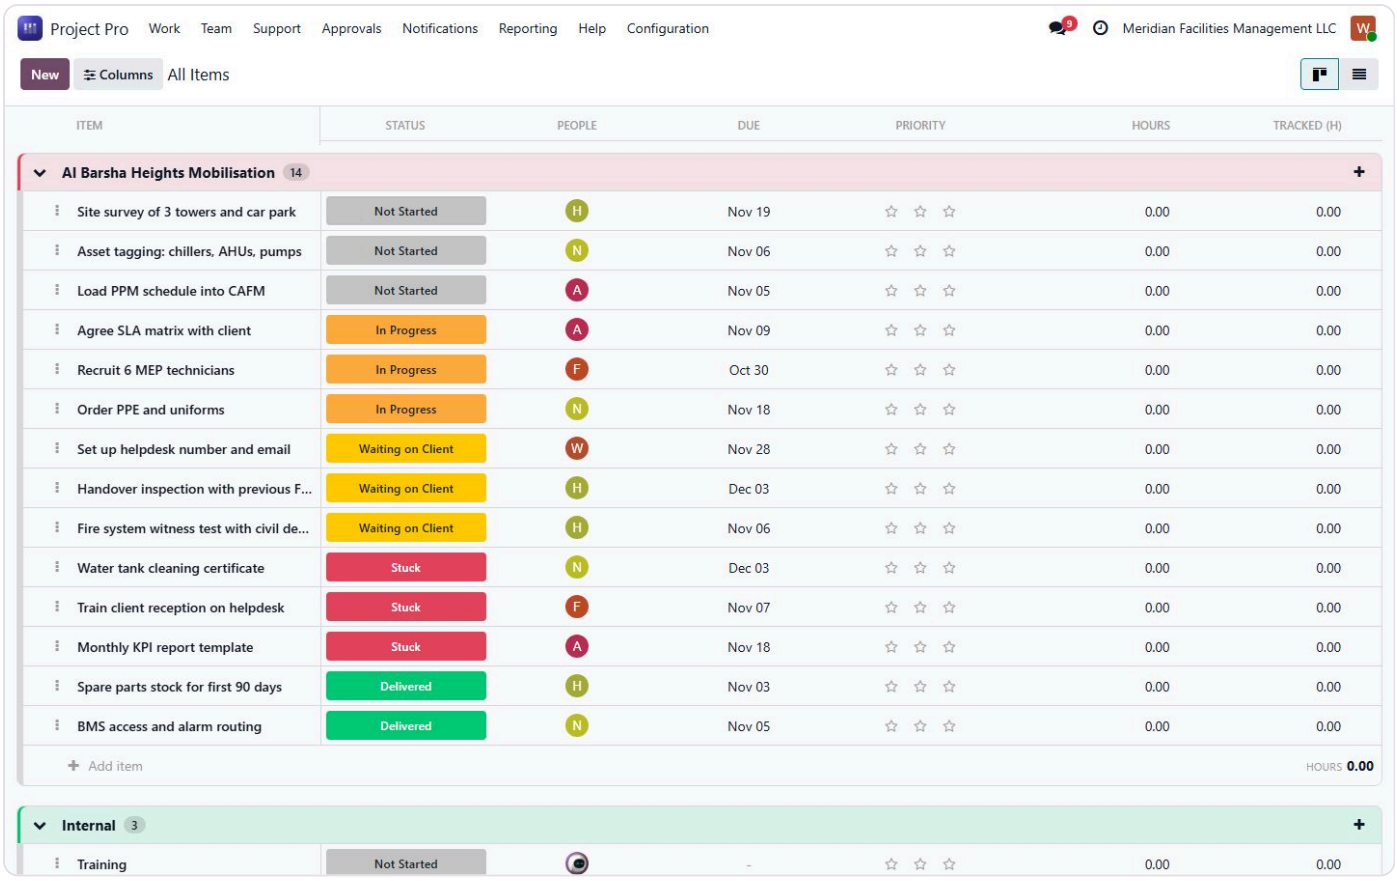

Mute a board

The bell in the strip mutes the board for you: email and phone messages about its items stop, while the inbox and digest still record what happened. Press it again to unmute. Your mutes are listed under Notifications, My Settings, Muted Items.

A support board (Tenant Requests): the same view with the ticket columns, the SLA state as a coloured pill and the channel each ticket came in by. Part 12 covers tickets.

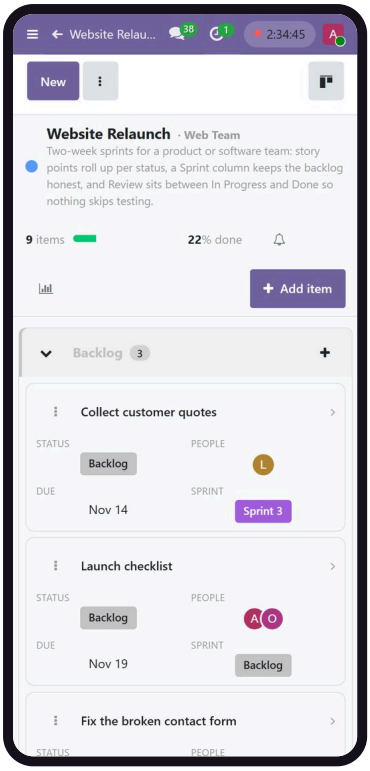

All Items

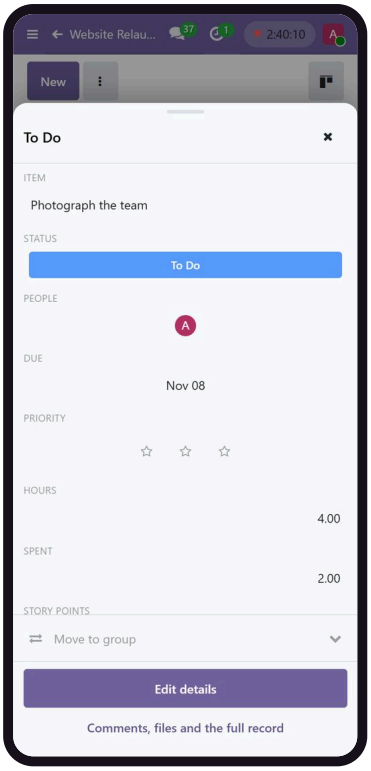

Work, All Items: every board item you can see, in the board view, grouped by project. Personal to-dos with no project are left out. The list button switches to a plain list.

On a phone

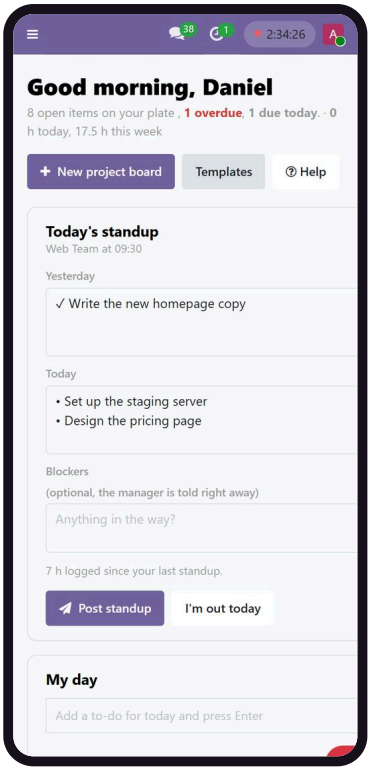

Below tablet width the grid turns into cards showing the status, people, due date and the board's columns. Tapping a card opens a sheet with every column editable and a **Move to group** list, because dragging is not reliable on a touch screen.

A board as cards

The item sheet

Home on a phone

PART 9 The item: its page and its verbs

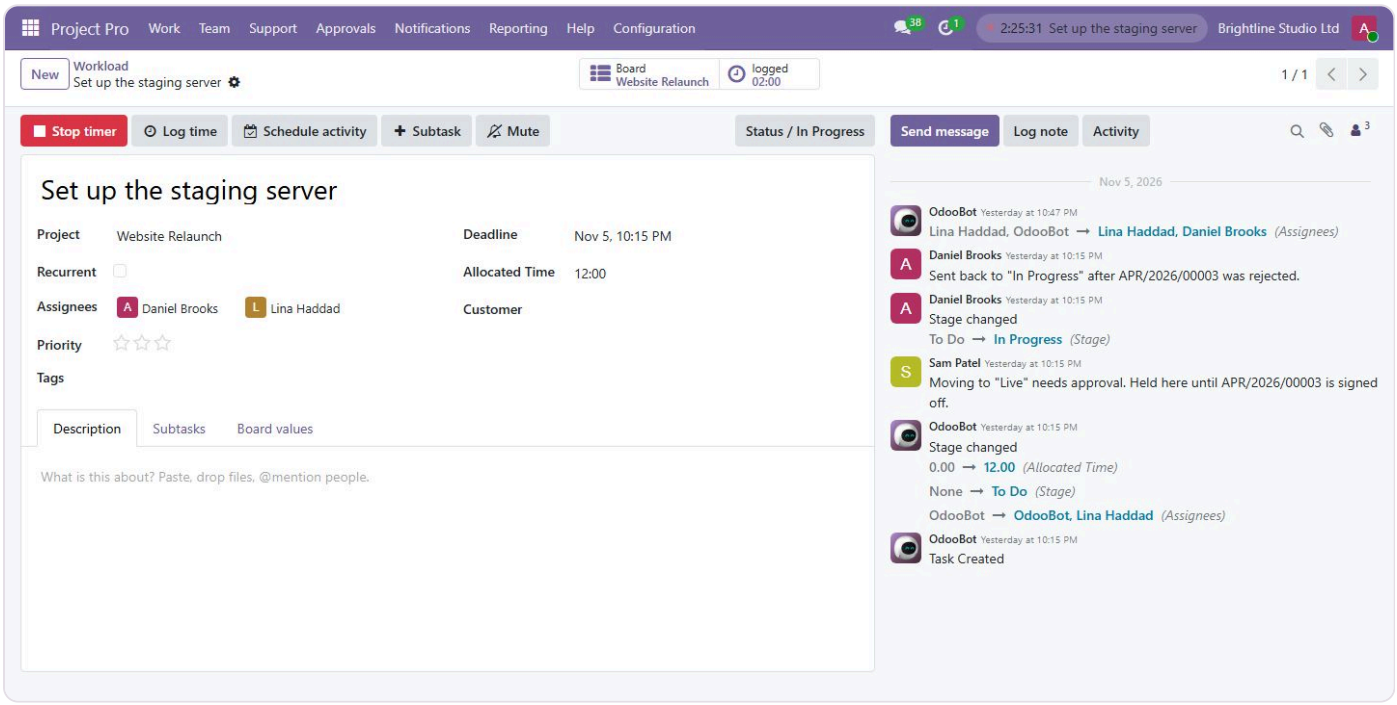

Every item has its own page: the verbs in the header, the status, the conversation beside it, subtasks with their own status, the board values, the linked ticket and the hours logged. It opens from the dialog, from standup chips, from My Time and from Ctrl+K.

IN THIS PART YOU WILL LEARN

- The row of verbs on every item
- Subtasks, recurrence and board values on the item page
- Scheduling an activity that reaches the person's phone
- Muting one item

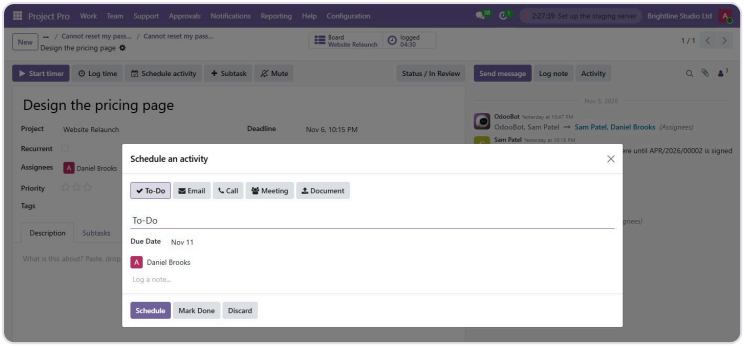

TRY IT YOURSELF ON THE DEMO

1. Open an item from a board, then press Full page
2. Read the verbs across the top and the tabs below

The item page. Header verbs, then project, board and Board Status, people, priority, deadline, allocated hours, Spent with a link to the time lines, tags and customer; tabs for Description, Subtasks and Board values; the chatter on the right.

Verb	What it does
Start timer / Stop timer	One running timer per person; starting one stops the other. Stopping writes the timesheet line NEEDS TIMESHEETS
Log time	Hours, date and what you did, in a small dialog NEEDS TIMESHEETS
Schedule activity	An Odoo activity (to-do, call, meeting) for anyone; it reaches their phone and fires again when due
Subtask	A new subtask under this item, on the same board
Send for approval	Asks named people to sign off this item (Part 15)
Approve / Reject	Shown to an approver whose turn it is
Send to a work board	On a ticket: makes a linked item for the team that fixes the cause (Part 12)
Open linked item	Jumps between a ticket and the work item made from it
Mute / Unmute	Silences email and push about this item for you

1

Schedule an activity

Schedule activity opens Odoo's activity dialog on the item: type, summary, due date, the person it is for. That person gets it in Odoo as usual and, with the Web Push add-on, on the phone, again on the day it is due or overdue.

A self-scheduled activity does not notify you about yourself.

Subtasks and repeating items

The Subtasks tab lists the children with their people, status, deadline and whether their status counts as done; the header shows how many are done. Recurrence is Odoo's own: with recurring tasks allowed on the project, an item can repeat weekly or monthly, and the next one appears on the board when this one is done.

Comments

The conversation lives on the item, in the dialog and on the page: write, @mention a colleague (they are told in the inbox and on the phone), attach files and log notes. Copying an item copies its board values; moving it to another project puts it on that project's default board.

PART 10 Home, My Day and the daily standup

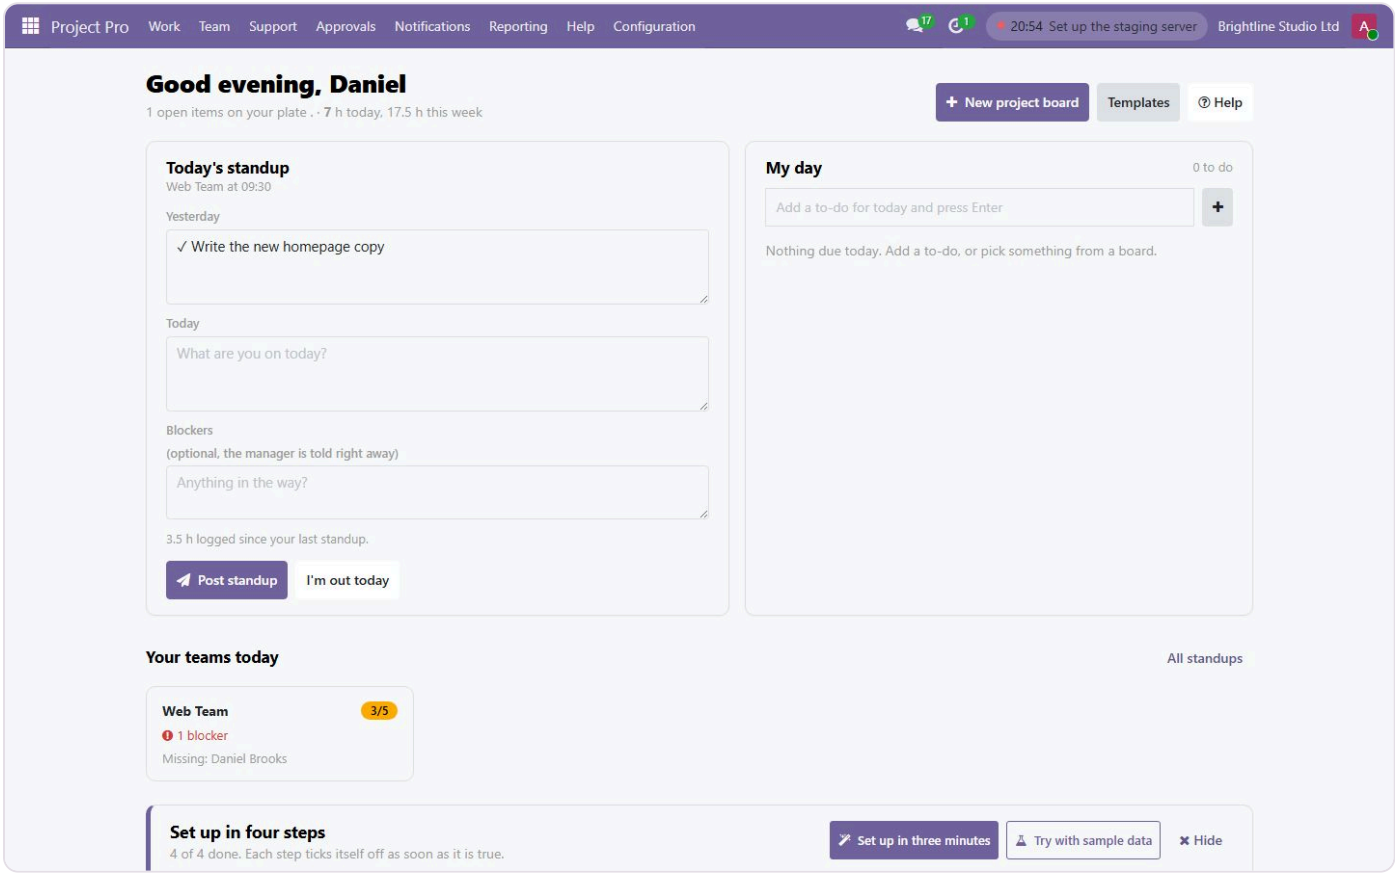

The app opens on Home: the person's own day, today's standup, the teams they are on and the boards they work. Nothing on Home is configuration.

IN THIS PART YOU WILL LEARN

- Every part of Home
- Posting a standup from Home, from Discuss, or marking yourself out
- The team page a manager reads each morning
- The Standup Log

TRY IT YOURSELF ON THE DEMO

1. Open Home and read the line under the greeting
2. Open Team, Standups and step back a day on the week strip

Home. Under the greeting: open items on your plate, overdue and due today, and the hours logged today and this week. Buttons: New project board, Templates, Help. Below: today's standup on the left, My Day on the right.

My Day

One list of what is yours today: personal to-dos (Odoo's own To-do app, so nothing is typed twice), board items due today and anything overdue, each marked. Type in the box and press Enter to add a to-do; tick an item to finish it. With Timesheets, each item has a play button that starts or stops its timer. A to-do opened from My Day can be given a project and then lands on that project's board.

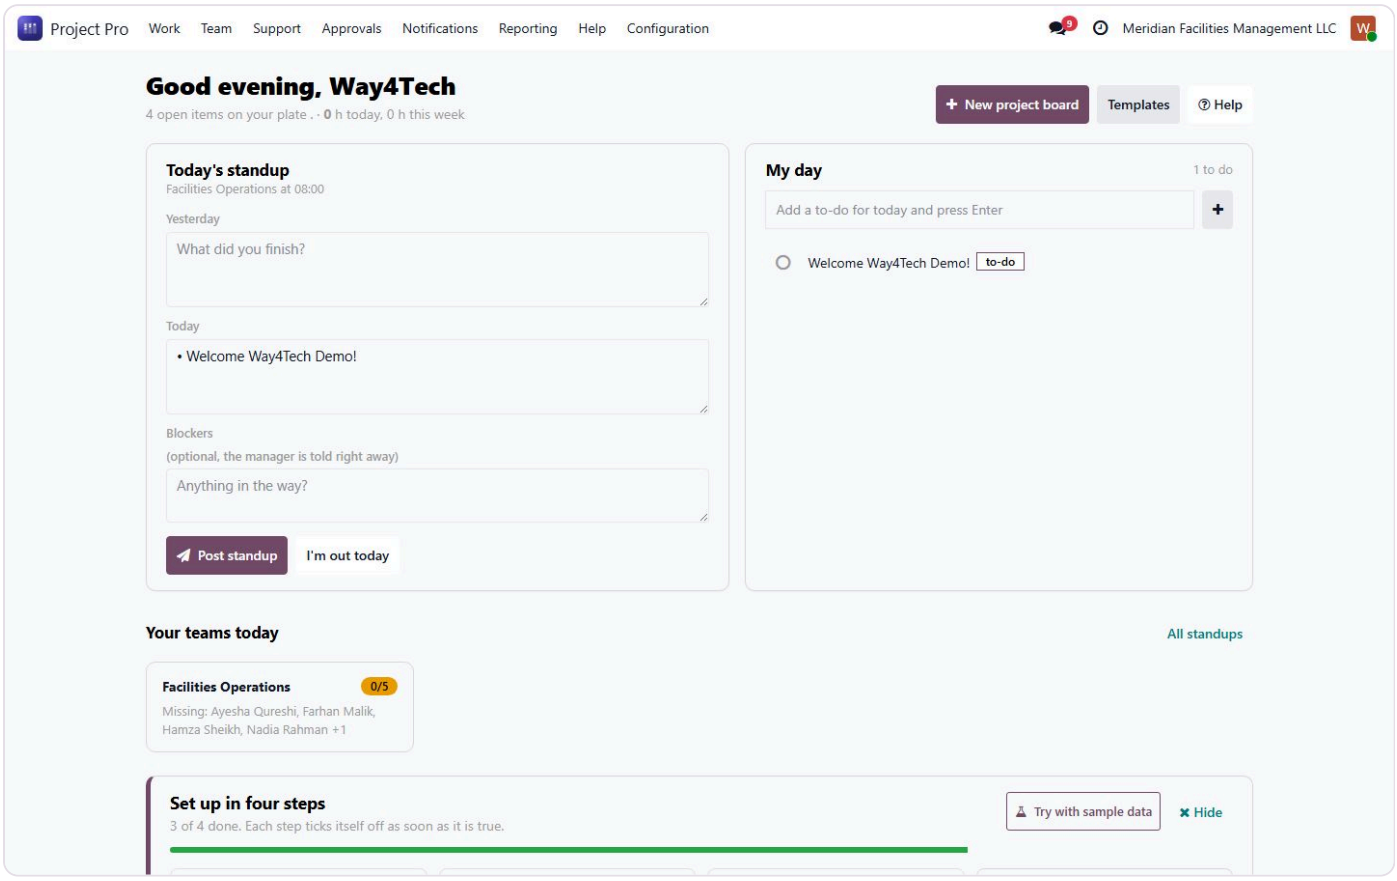

Today's standup

Three boxes: **Yesterday**, **Today**, **Blockers**. They arrive pre-filled from the data: the items you finished since your last standup, what is on your plate today and, with Timesheets, the hours logged since the last one. On a Monday it looks back over the weekend. **Post standup** posts it; **I'm out today** marks a day off so nobody chases you. Once posted, the card shows the finished and planned items as chips that open the item, **Edit**, **Make to-dos from today** (every line of Today that is not yet an item becomes a to-do) and **See the team**.

> In any Discuss channel or chat, type **/standup yesterday | today | blockers** to post the day's standup without leaving the conversation.

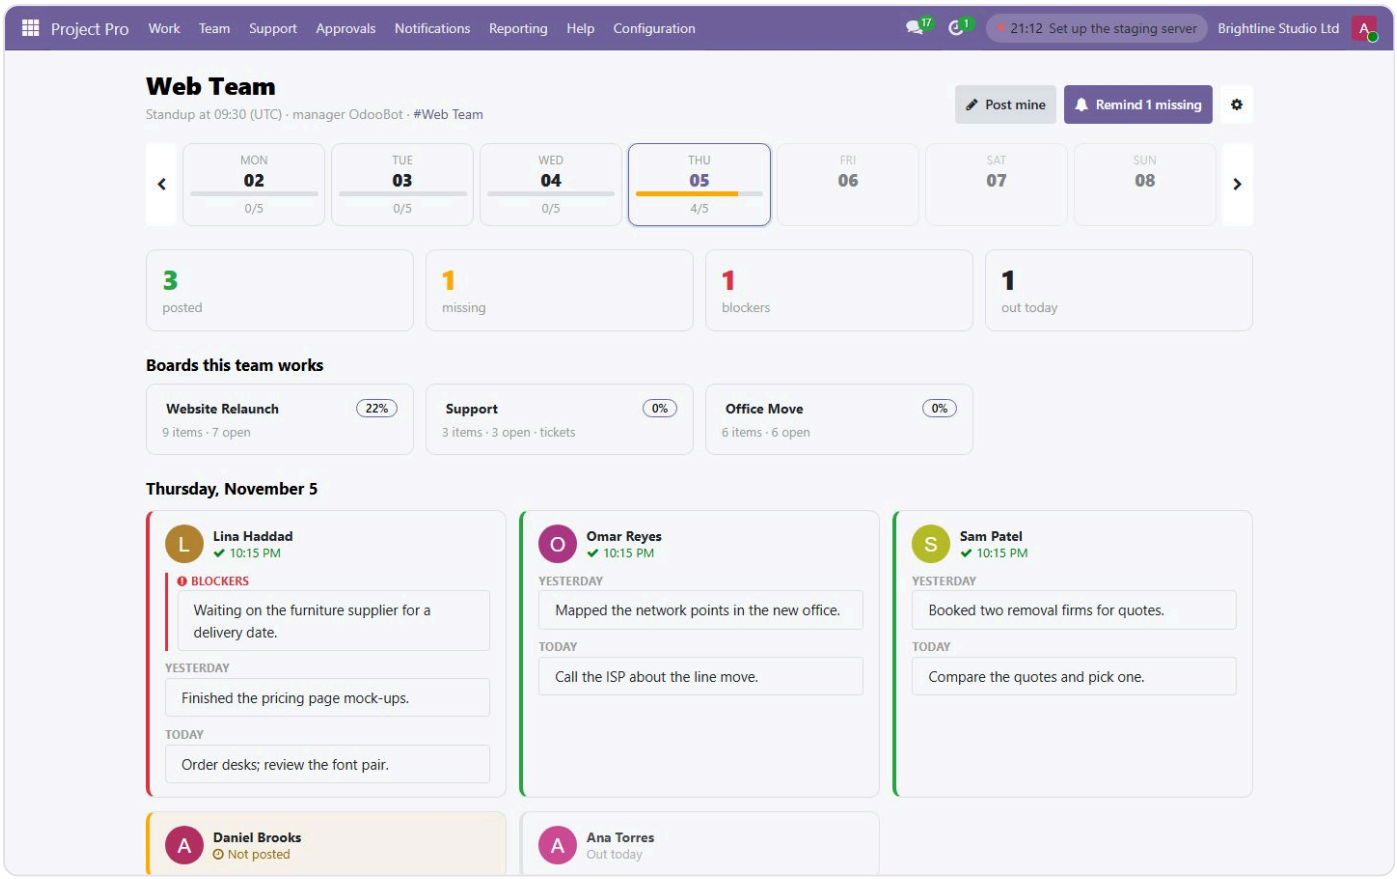

Your teams and your boards

Your teams today shows each team with posted over expected, the blockers and who is missing. Then the four-step checklist (Part 4), the tiles (My open items, Due today, Overdue, Done this week, and for managers Nobody's items, each opening the matching list), every board you are on as a card with its colour, progress and how many items are yours, and the recent changes, which open the item dialog.

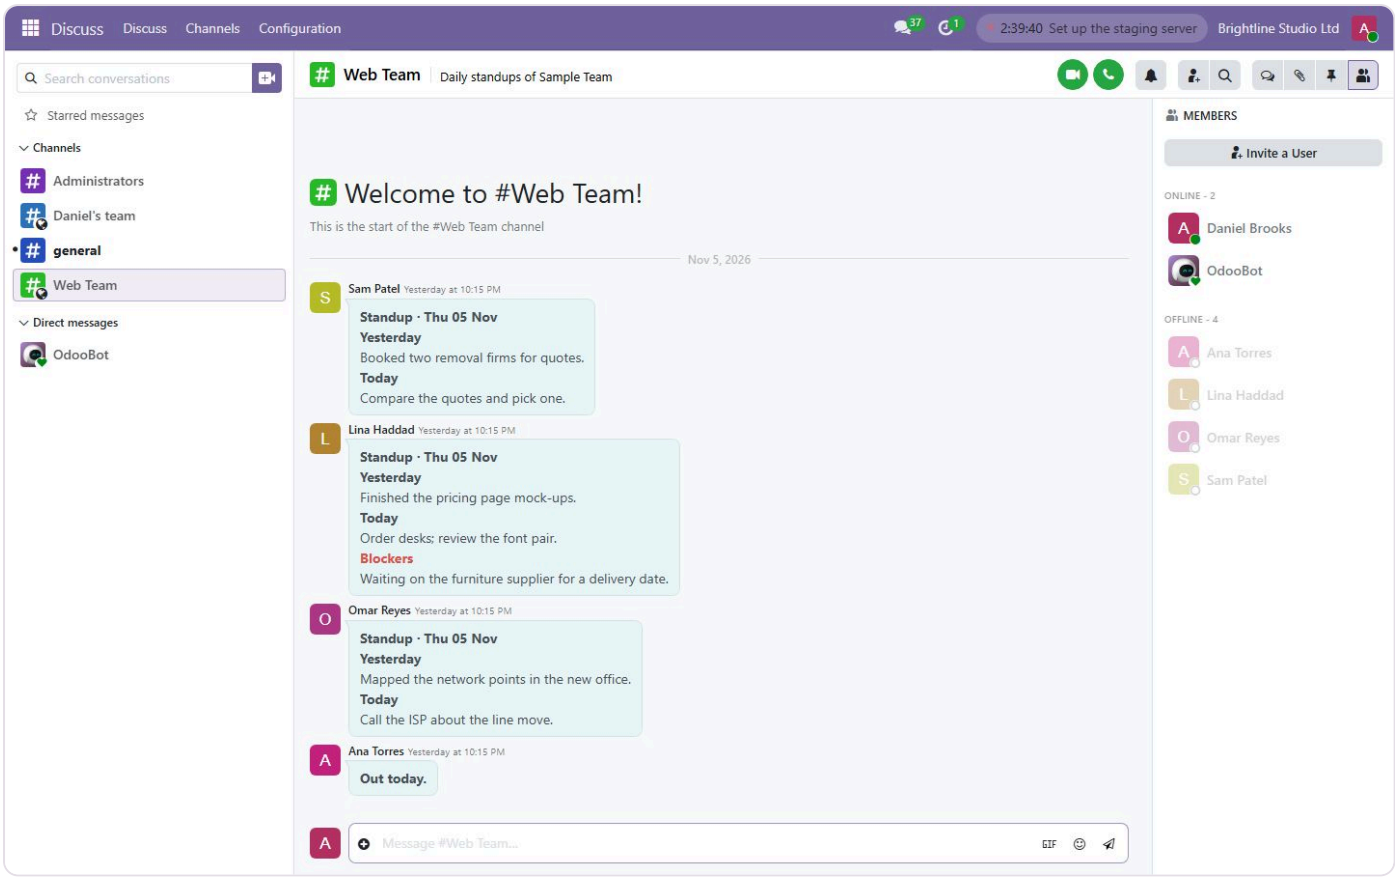

Home on the live demo, for a person on the Facilities Operations team.

The team page

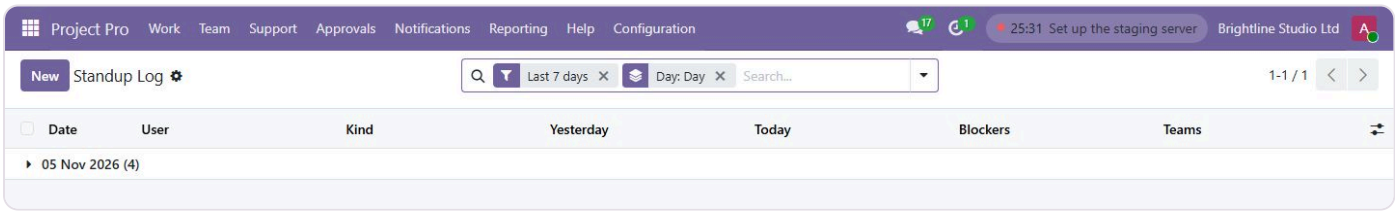

Team, Standups: one team, one day. The header carries the standup time, the manager and the Discuss channel, with **Post mine**, **Remind missing** and the team settings. A week strip shows posted over expected per day; the tiles count posted, missing, blockers and out today; the boards this team works follow; then each person's card, blockers first in red.

Remind missing sends the nudge right now to everyone who has not posted. Step through days with the arrows on the week strip. With several teams, pick the team at the top.

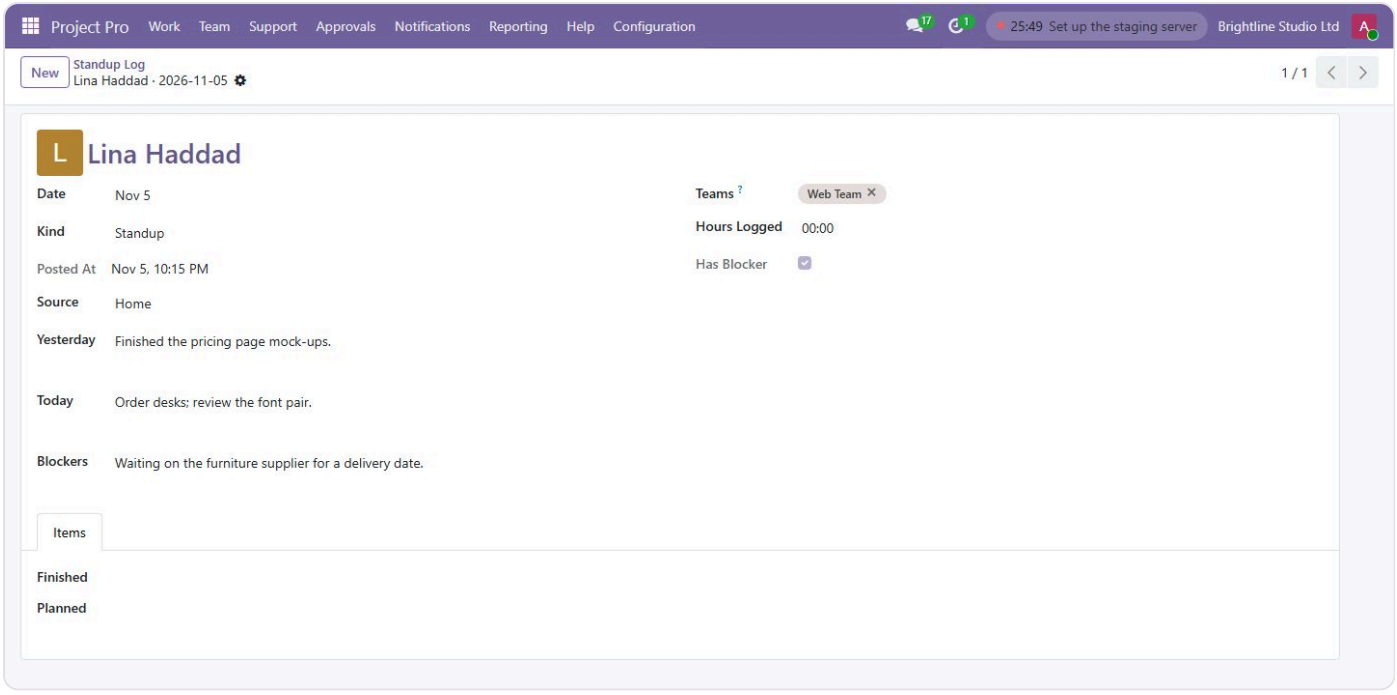

Each team has its own Discuss channel. Every standup lands there as a message from its author, blockers in red, so replies happen where people already talk.

The Standup Log

Reporting, Standup Log: every standup, with the date, person, kind (Standup or Out today), the three texts, the blocker flag, hours logged, when it was posted, teams and source (Home, Discuss or Form). Filters: Mine, With a blocker, Today, Last 7 days, Last 30 days.

One standup: the person, date and kind, when and where it was posted, the hours, and on the Items tab the items it finished and planned. A teammate can read another person's standup but not edit it.

PART 11 Time: timer, Log time, My Time and Team Hours

Odoo's own Timesheets app is free and Community, but it has no timer. With it installed, every item gets one, and the hours show up on the board, on Home, in the standup and in two time screens.

IN THIS PART YOU WILL LEARN

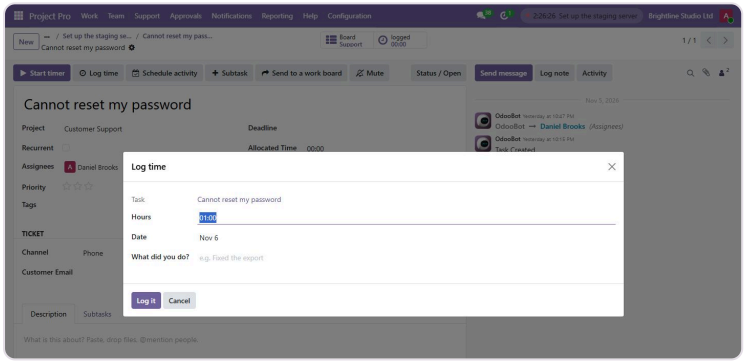

- Starting and stopping the timer, from the item, My Day, Ctrl+K or the top bar
- Logging time by hand
- My Time, the week grid, and Team Hours

TRY IT YOURSELF ON THE DEMO

1. Open Team, My Time and move back a week

The timer NEEDS TIMESHEETS

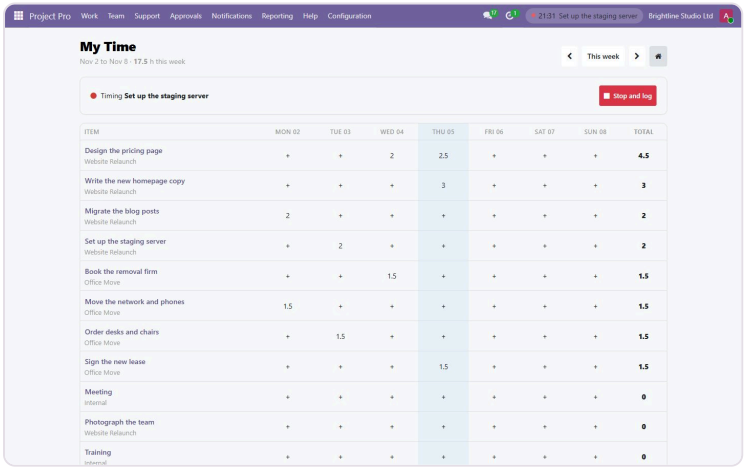

Start timer on an item, the play button on My Day, or Start timer in Ctrl+K. One timer runs per person: starting another stops the first and logs it. The running timer sits in the top bar of every page with **Stop** and **Open**. Stopping writes a timesheet line for the minutes. A person without an employee record gets one the first time they log, so it works on day one. A bare to-do with no project refuses time until it is put on a project.

1

Log time by hand

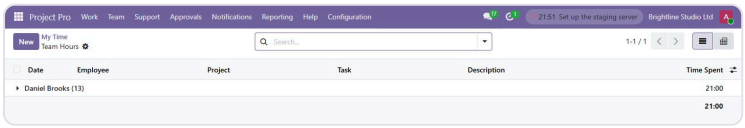

Log time asks for the hours, the date and **What did you do?**, then **Log it**. The line lands in Timesheets against the item's project.

2

My Time

Team, My Time: a week grid, a row per item and a cell per day. Click a cell to add hours there; the row and day totals update. Arrows move between weeks; the running timer shows at the top with Stop.

3

Team Hours

Team, Team Hours (managers): the timesheet lines as a pivot, per person per week, on project work.

Boards show a **Spent** column with a total per lane, Home shows hours today and this week, and the standup carries the hours logged since the last one. Without the Timesheets app, none of these buttons or columns appear.

PART 12 Support: tickets with an SLA

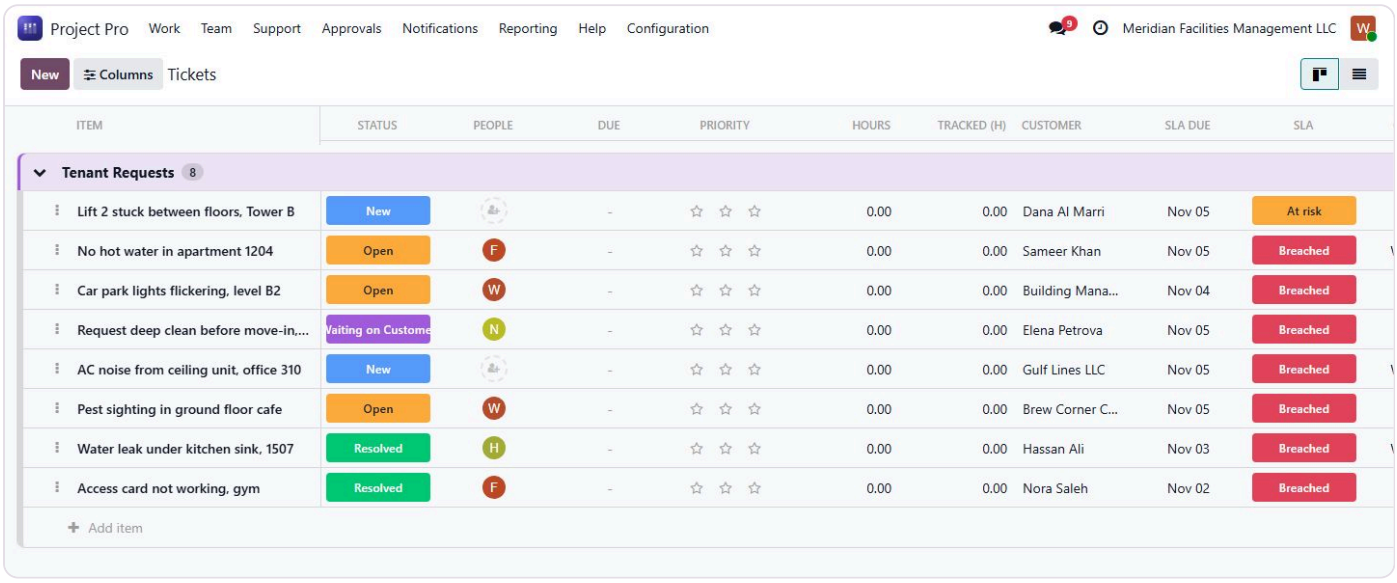

Community has no Helpdesk. Here a ticket queue is a board of kind Support. Every item on it carries a customer, a channel and an SLA deadline worked out from the board's hours, and the customer hears about it by email.

IN THIS PART YOU WILL LEARN

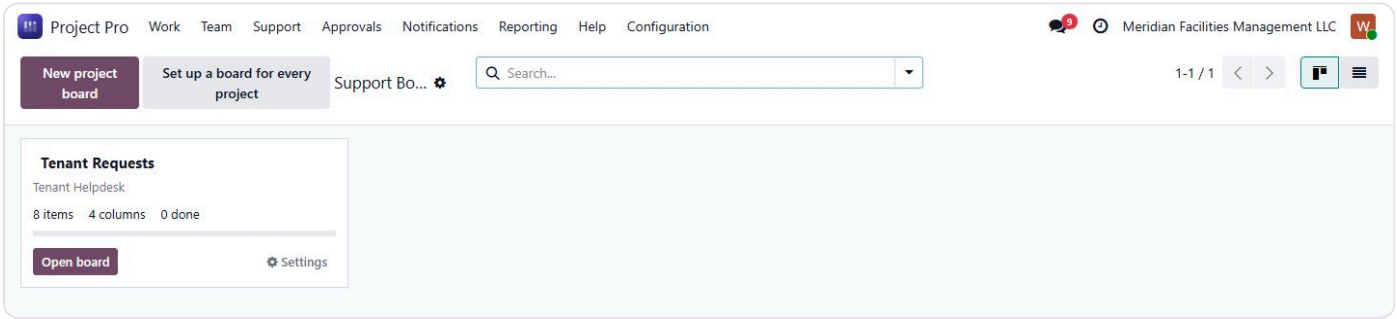

- How a ticket arrives: email, the public web form, or typed in
- The SLA deadline and its four states
- Who a new ticket goes to
- The customer's mail and ticket page
- Sending a ticket to a work board

TRY IT YOURSELF ON THE DEMO

1. Open Support, Tickets, switch to the list and use the SLA breached filter
2. Open a ticket and read its Ticket block

Support, Tickets: every ticket on every support board, in the board view, with the customer, SLA due, SLA state and channel. Switch to the list to search by ticket, customer, email, owner or board and use the filters Open, Mine, Nobody's, SLA breached, SLA due today, Never answered, By email and By web form.

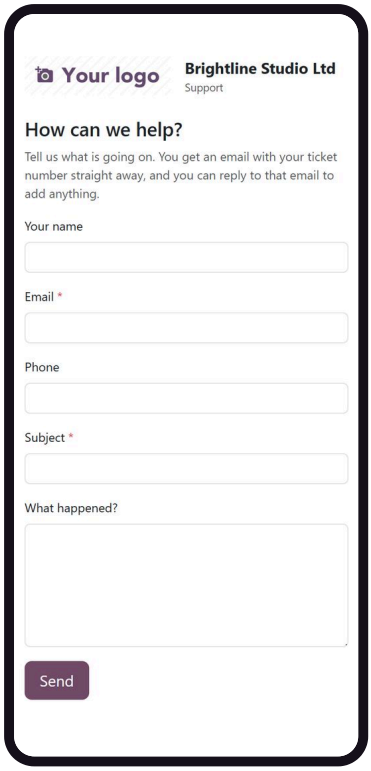

Support, Support Boards: each queue with its open and breached counts.

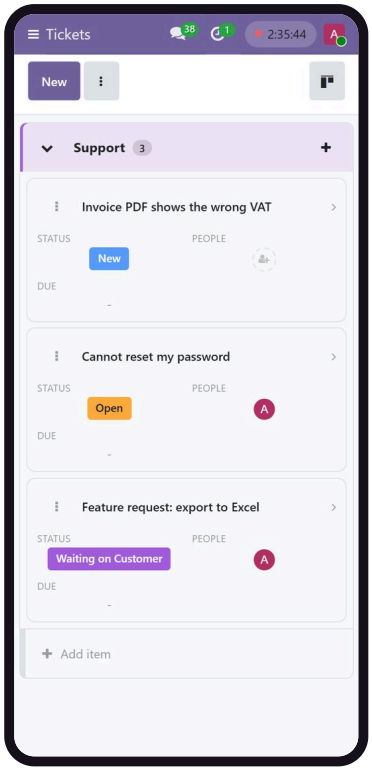

How a ticket arrives

Route	What happens
Email to the alias	Mail to the board's project alias becomes a ticket with channel Email; replies to the thread land in the ticket's chatter
The web form at /support/new	A public page, no Website app needed: name, email, phone, subject, the problem. A ticket with channel Web form lands in the first status. Rate limited to ten per hour per connection, with a

	hidden honeypot field that drops bots
Typed in	Add item on the board, with channel Phone, Chat or Other

The public web form

Tickets on a phone

The SLA

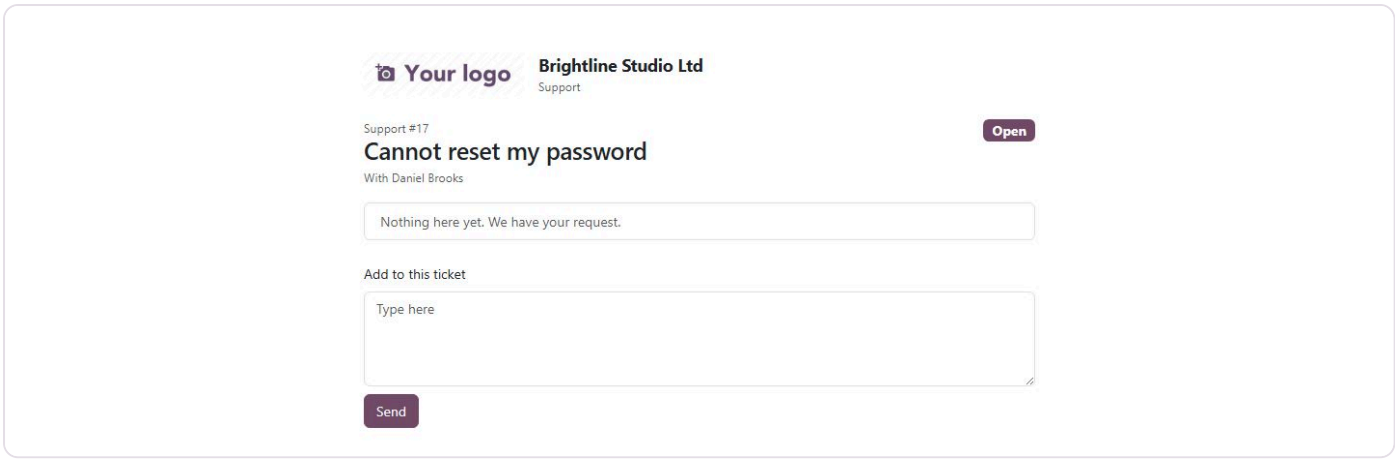

The SLA deadline is the ticket's creation time plus the board's **Resolve Within (hours)**. Its state shows as a coloured pill: **On track** (green), **At risk** (amber, under a quarter of the time left), **Breached** (red) and, once a done status is reached, **Met** (blue) or Breached by the done date. The first internal reply is stamped once as **First Reply**; the acknowledgement does not count. The recipe **Tickets due today raise a flag** tells the manager and the owner on the day the SLA runs out.

Who gets a new ticket

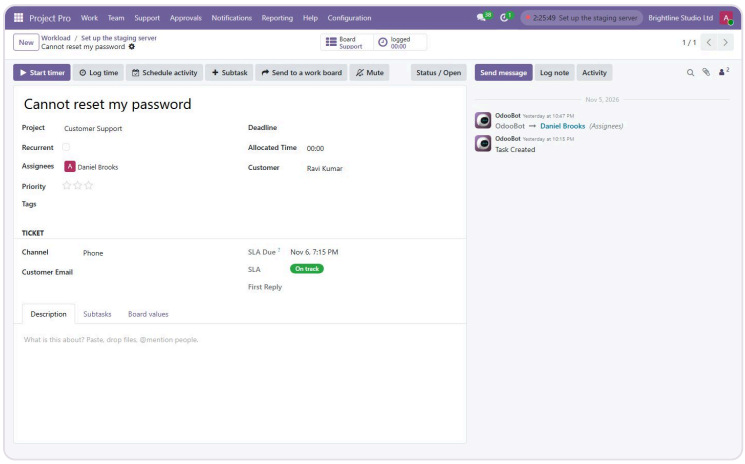

The board's **New tickets go to**: **Nobody, the team picks tickets up**, **In turn across the team** (the board remembers who was last), or **Whoever has the fewest open tickets**.

What the customer receives

With **Acknowledge new tickets by email** on, the customer gets an acknowledgement with the ticket number; with **Tell the customer when the status changes** on, a mail at each status change, once per change. Every mail closes with the board's own signature, robot mail is signed by the company, and with **Give customers a ticket page** on, it carries a link to a page where the customer sees the status and the replies and can answer without a login. The answer lands in the ticket's chatter.

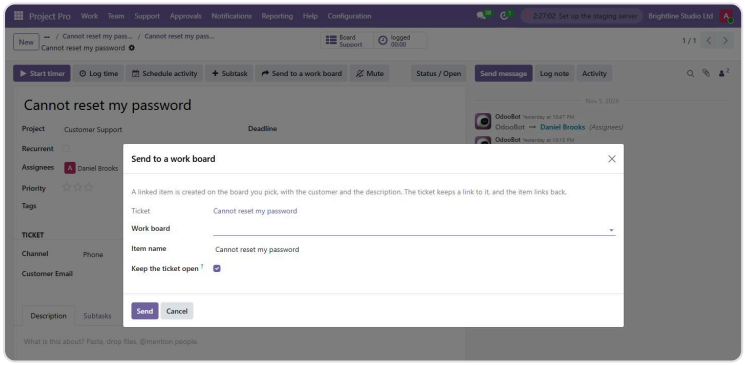

The customer's ticket page, reached by the private link in their mail.

1

Work the ticket

The ticket's page shows the Ticket block: channel, customer email, SLA due, SLA state, first reply and the linked item. The verbs are the same as any item, with timer, Log time and Schedule activity.

2

Send to a work board

When the ticket shows a fault somebody has to fix, **Send to a work board**: pick the work board, adjust the item name, and choose whether to **Keep the ticket open**. Press Send.

Both sides keep the link. The work item carries no SLA and never mails the customer.

PART 13 The timeline

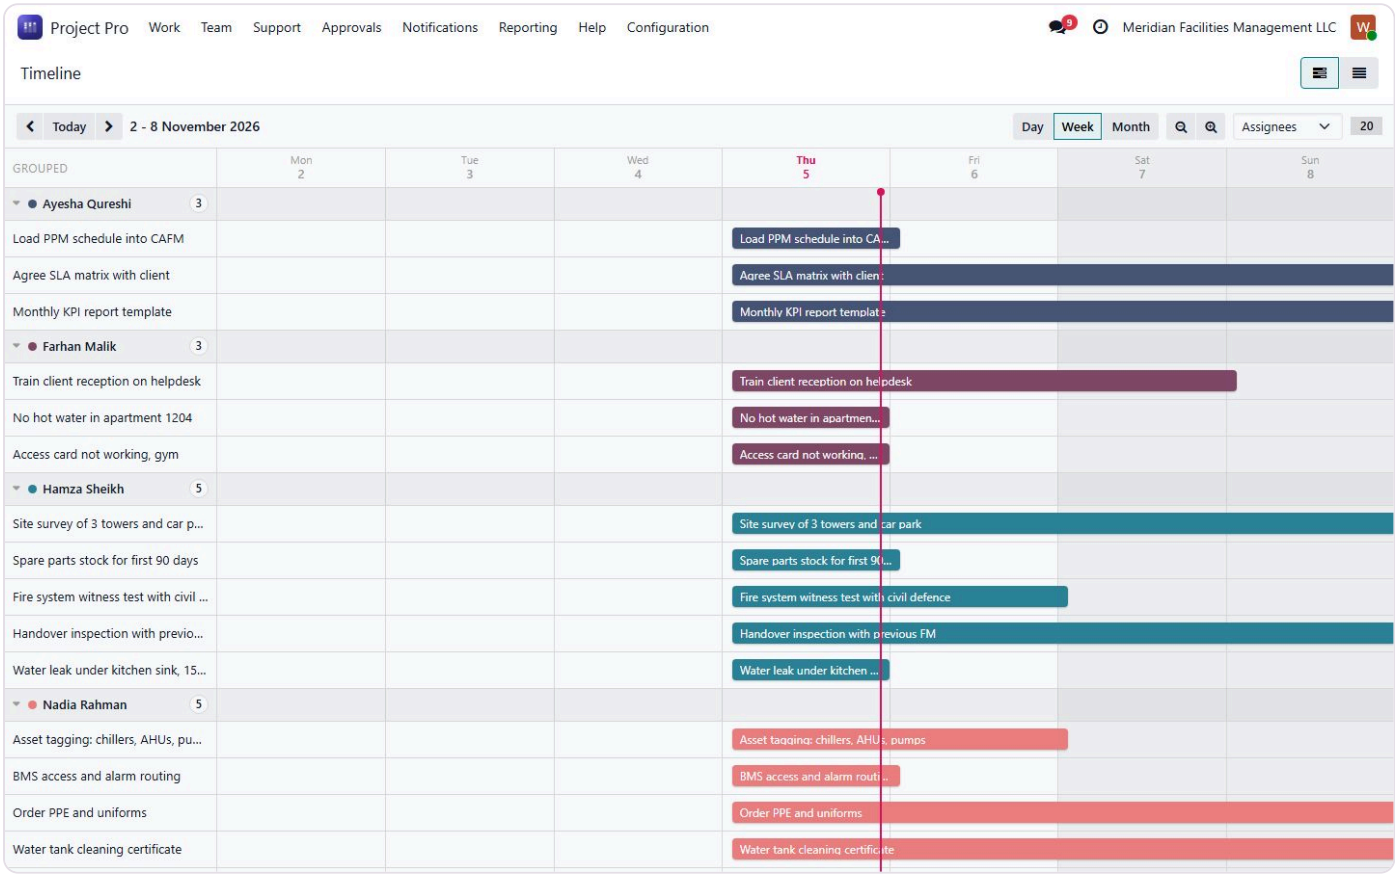

The Enterprise gantt cannot be installed on Community, so Project Pro brings its own timeline, written on the public web framework. Each task is a bar from its start to its deadline.

IN THIS PART YOU WILL LEARN

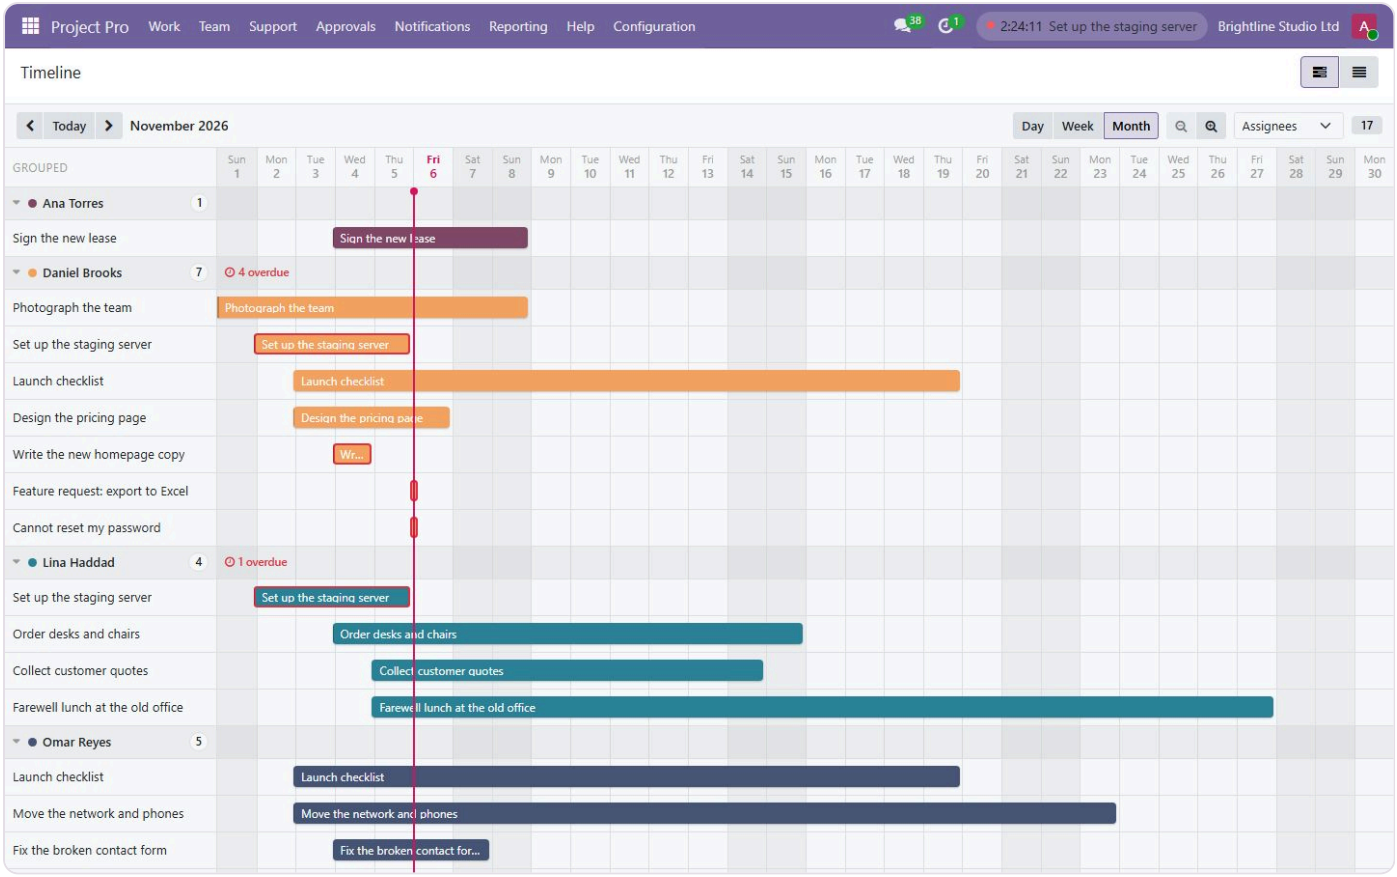

- Reading the timeline and changing its scale and grouping
- Rescheduling by dragging, and what can be dragged
- Dependency arrows and creating a task by double click
- The agenda it becomes on a phone

TRY IT YOURSELF ON THE DEMO

1. Open Work, Timeline and switch between Day, Week and Month
2. Change the grouping from Assignees to Project

Work, Timeline, a week grouped by assignee: one row per task, a bar from start to deadline, the red line is now. Group headers carry a task count and fold. The toolbar: back, Today, forward, the date range, Day, Week, Month, zoom out and in, the grouping, and the number of tasks in the window.

The same timeline by month, on the sample workspace.

Where the dates come from

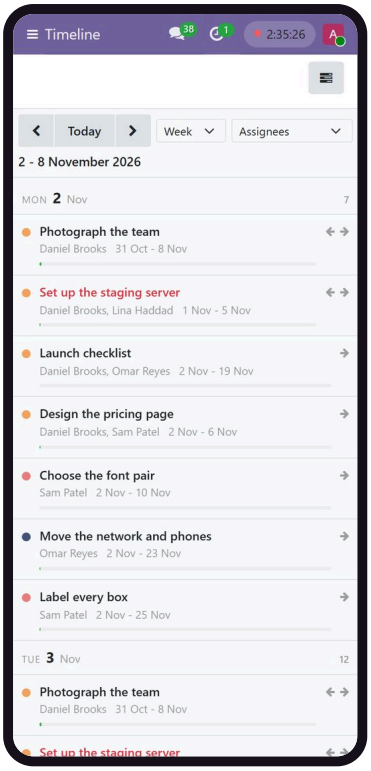

Odoo 19 Community has no planned start date on a task, so a bar runs from the **assignment date** to the **deadline**. If you add a start field of your own, point the view at it by editing the view record; the field names are read from the view, not fixed in the code.

Rescheduling

Drag the end of a bar to change the deadline, or press Shift with an arrow key while the bar has focus. Out of the box that is the only handle, because Odoo keeps the assignment date read-only. Point the view at a writable start field and both ends and the whole bar become draggable. Movement snaps to whole columns and uses calendar arithmetic, so a drag across a clock change does not land an hour off. A refused write puts the bar back and says why. Ctrl and the mouse wheel zoom; on a touch screen, pinch.

Arrows and new tasks

Where tasks depend on each other through Odoo's own **blocked by** relation, an arrow runs from the blocker to the blocked task; an arrow whose target starts before its source finishes is flagged as violated. Double click an empty cell to open a new task dated to that cell and assigned to that row's person. At most 500 tasks are drawn per window, and the toolbar says so when the limit is hit.

On a phone the timeline becomes an agenda, one section per day

PART 14 The workload view

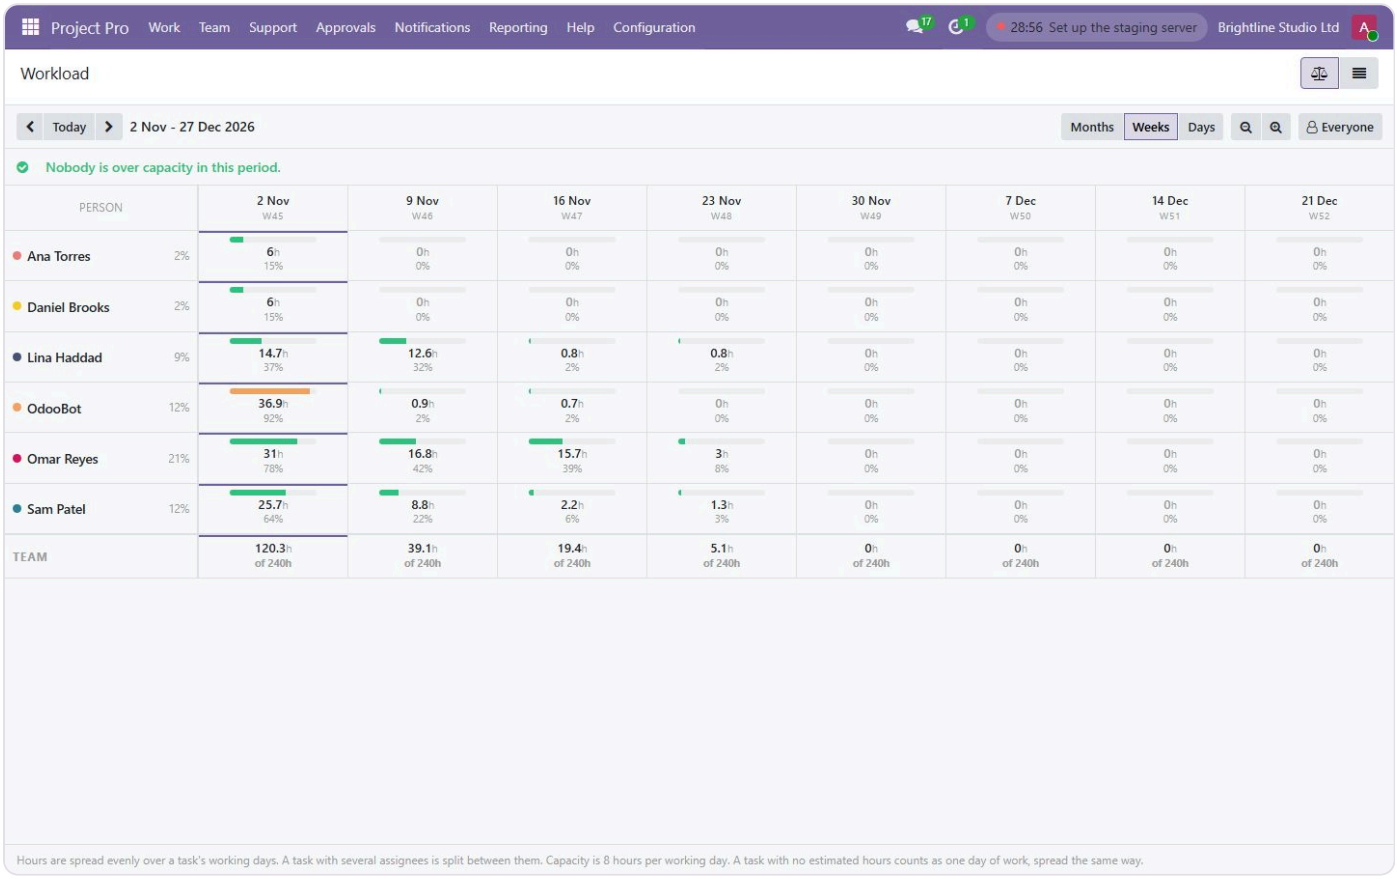

People against periods: who is booked past what they can do, and in which week. The arithmetic is stated under the grid, so nobody has to guess what a red cell means.

IN THIS PART YOU WILL LEARN

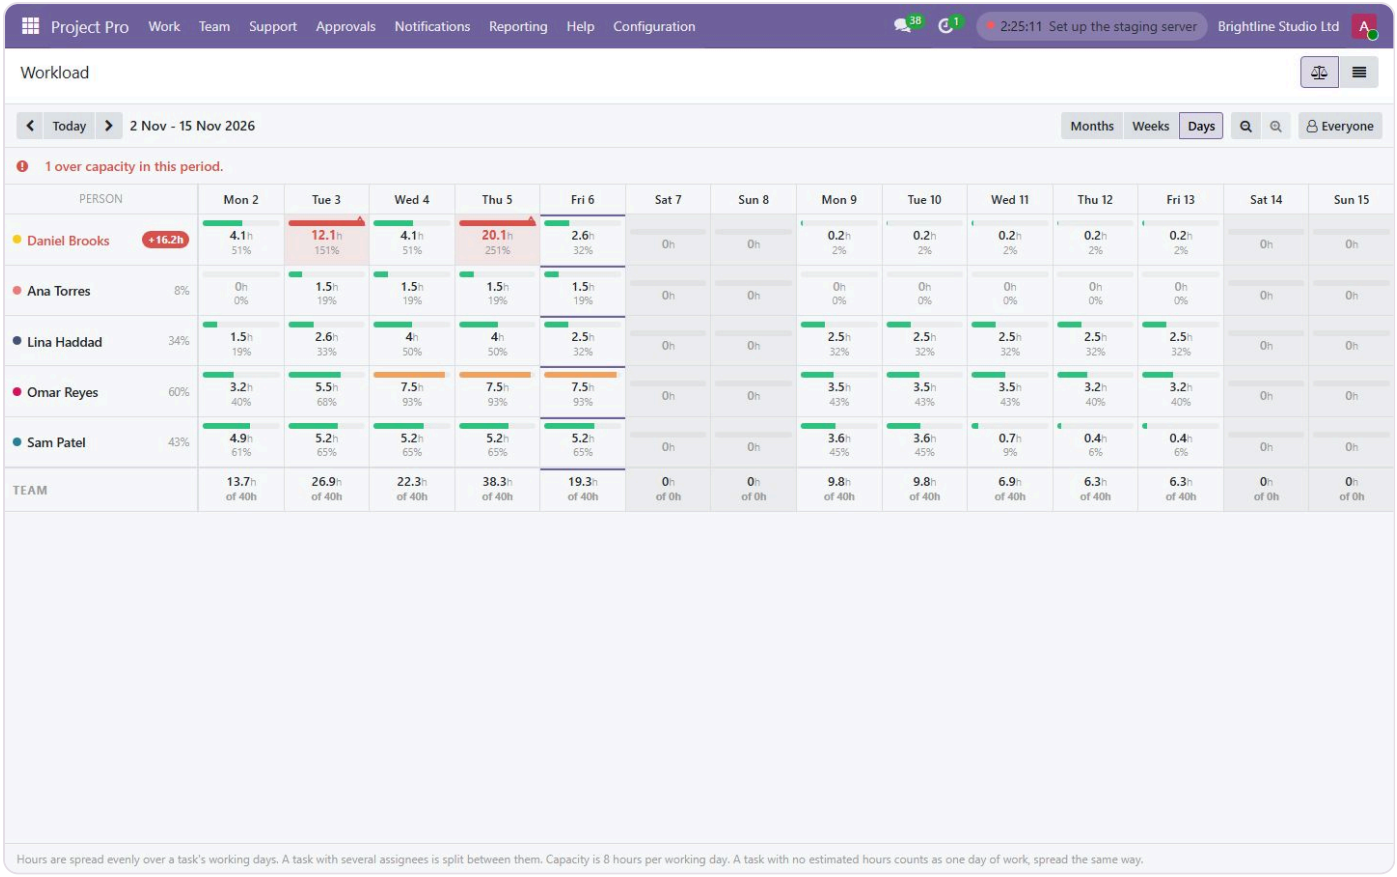

- Reading a workload cell
- How hours are spread and capacity worked out
- Months, weeks and days, and showing everyone

TRY IT YOURSELF ON THE DEMO

1. Open Work, Workload and switch to Days
2. Press Everyone to add people with nothing booked

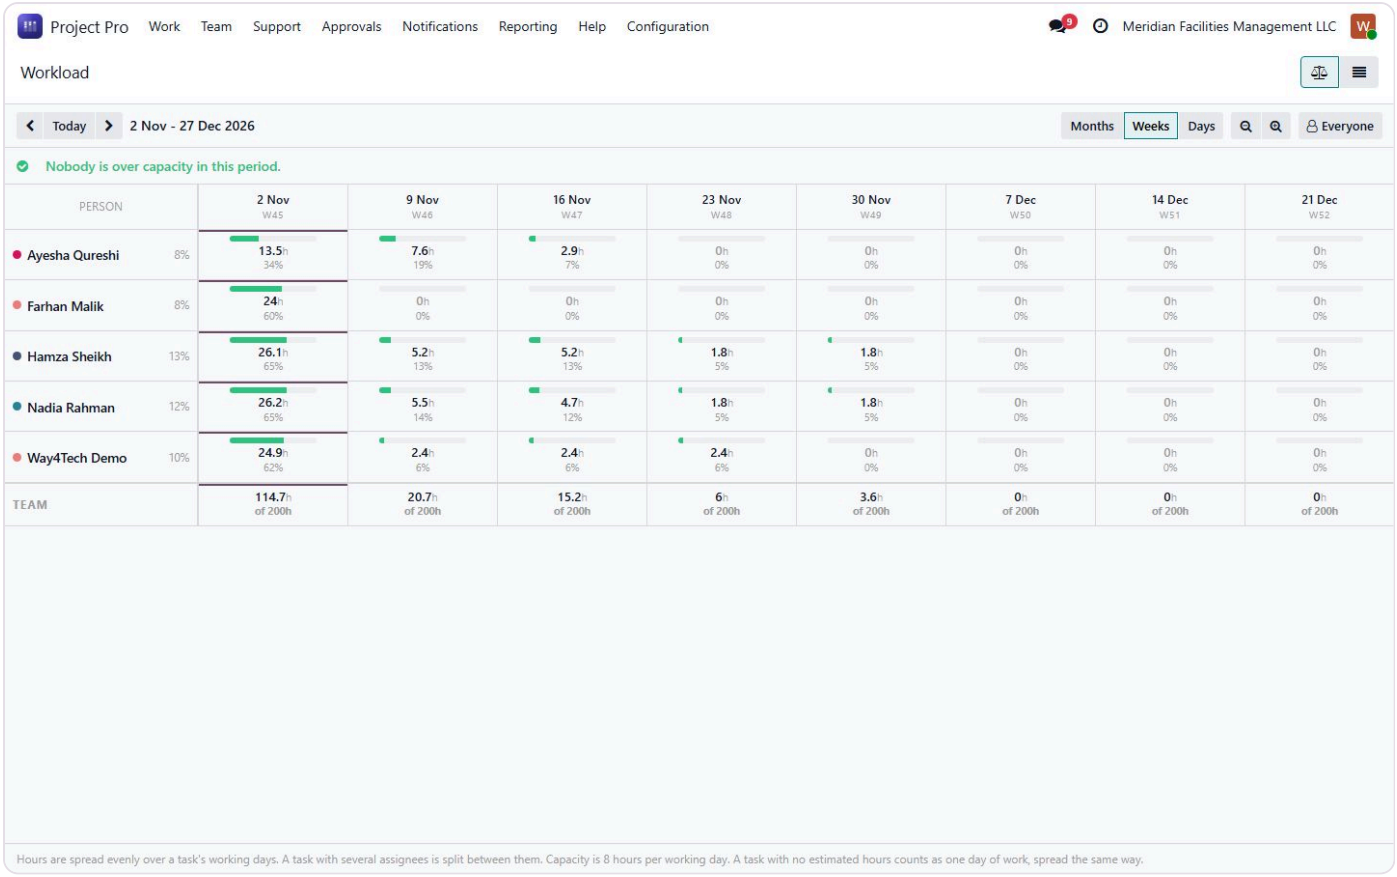

Work, Workload: one row per person, and in each cell the allocated hours, the share of that person's capacity they fill and a bar. The percentage beside each name is their load over the whole window; the TEAM row adds everyone up. A banner says who is over capacity.

The same by day. The toolbar switches Months, Weeks and Days, and **Everyone** adds people with nothing booked, so an idle person is visible rather than absent.

The arithmetic

Rule	How it works
Spreading	A task's allocated hours are spread evenly over its working days between start and deadline, not dropped on the deadline
Several assignees	The hours are split between them: two people on a 16 hour task is 8 hours each
No estimate	A task with no allocated hours counts as one day of work, spread the same way
Capacity	8 hours per working day, set on the view; a person record with its own daily capacity field overrides it
Weekends	Set on the view too, so a six-day week is one attribute away
Colours	Over capacity when hours exceed capacity; tight from 85 percent

The workload on the live demo.

PART 15 Approvals that hold a task

An approval rule is configuration, not code. It says when a sign-off is needed, who signs, in how many levels, and whether the task is held while it waits. The hold lives in the task's own save, so a drag on the board, the list, an import or another program cannot walk around it.

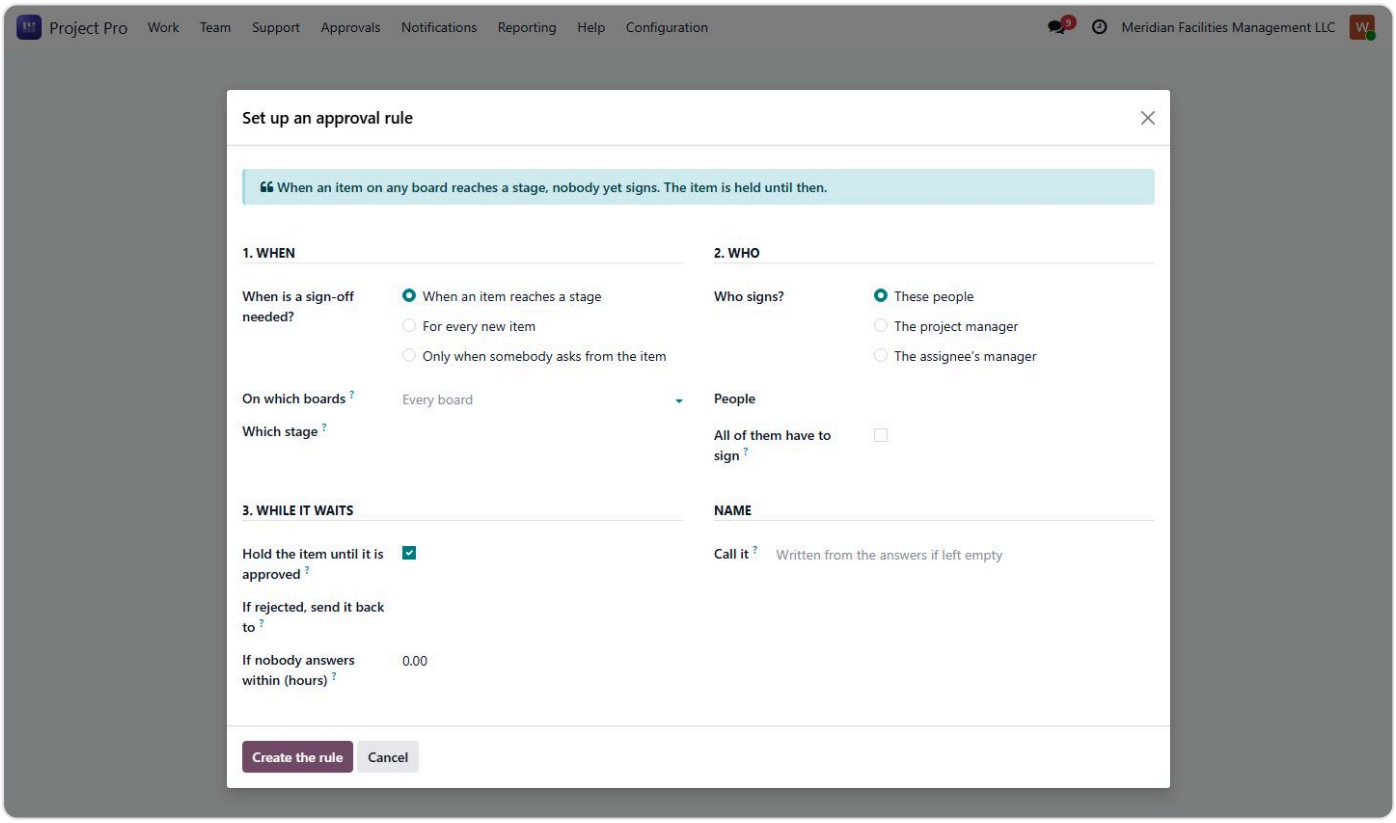

IN THIS PART YOU WILL LEARN

- Setting up a rule with the short form, and the full rule form
- The five triggers, levels and quorum
- What happens to a held move, and to the rest of the edit
- Approve, reject, request changes, send round again
- Escalation, delegation and the audit trail
- Asking for a sign-off from the item

TRY IT YOURSELF ON THE DEMO

1. Open Approvals, Set up a rule and read the sentence under In plain words as you change the answers (then Cancel)
2. Open Approvals, All Approvals and open one request

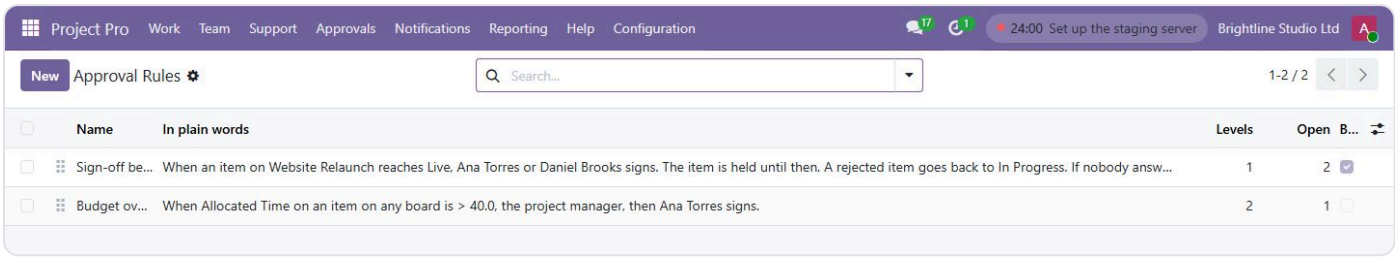

Set up a rule MANAGERS

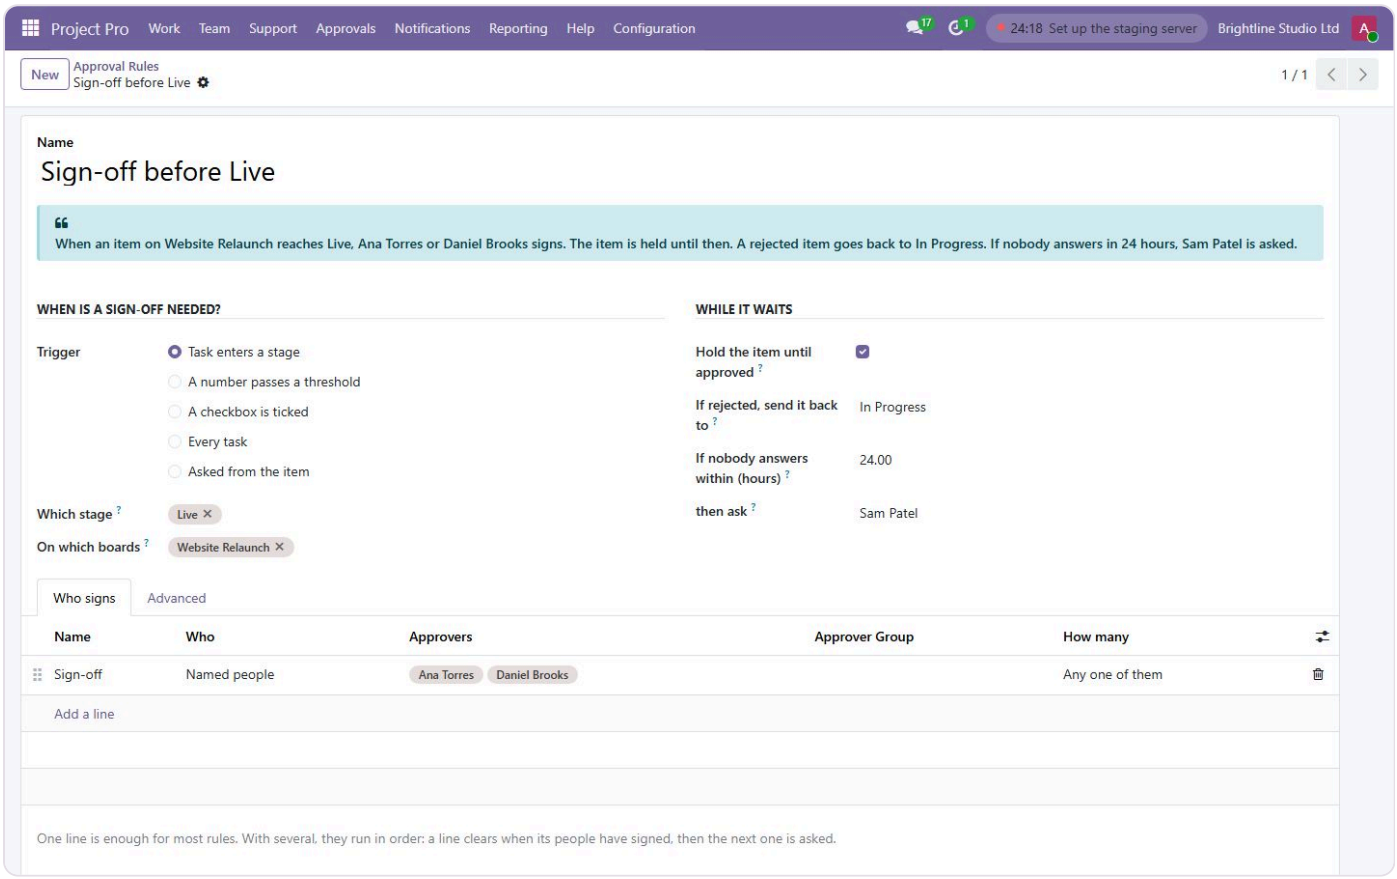

Approvals, Set up a rule: four short questions, and the rule written out in plain words at the top as you answer.

Question	Answers
1. When is a sign-off needed?	When an item reaches a stage (pick the boards and the stage), for every new item, or only when somebody asks from the item
2. Who signs?	These people (with All of them have to sign, or the first signature clears it), the project manager, or the assignee's manager
3. While it waits	Hold the item until it is approved; If rejected, send it back to a stage; If nobody answers within so many hours, then ask a named person
Name	Call it something, or leave it and a name is written from the answers

Press **Create the rule** and the full rule opens. The short form covers most needs; the full form adds levels, number and checkbox triggers and a filter.

Approvals, Rules (managers): each rule in plain words, its trigger, levels, open requests, whether it blocks, the boards, and escalation.

A rule. **When is a sign-off needed?** on the left, **While it waits** on the right, **Who signs** below as ordered levels, and an **Advanced** tab with the filter (Only items matching), Also give approvers a to-do, the order among rules, company and note.

Trigger	Fires when
Task enters a stage	An item is moved into one of the guarded stages
A number passes a threshold	Any stored number on the task, custom fields included, is greater than, at least, less than or at most a value
A checkbox is ticked	A box on the task, a "needs legal" flag for instance
Every task	Every new item, for the project where everything is signed off
Asked from the item	Somebody presses Send for approval on the item

A rule can be limited to certain boards and narrowed with a filter. A half-configured rule, such as a stage trigger that names no stage, is refused on save rather than matching nothing while you think tasks are guarded.

Levels and quorum

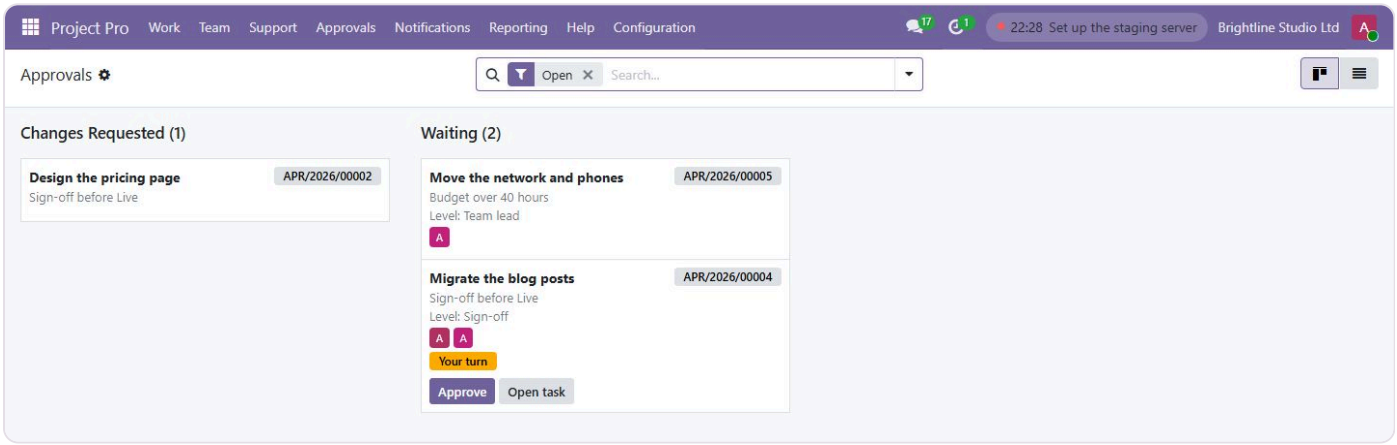

Who	Resolved as
Named people	The people listed on the level

Anyone in a group	Every user in an Odoo group, read at the moment the level opens
The assignee's manager	From the Employees tree when it is installed, otherwise the project manager USES EMPLOYEES
The project manager	The project's manager
The people named when asked	Whoever was picked in Send for approval

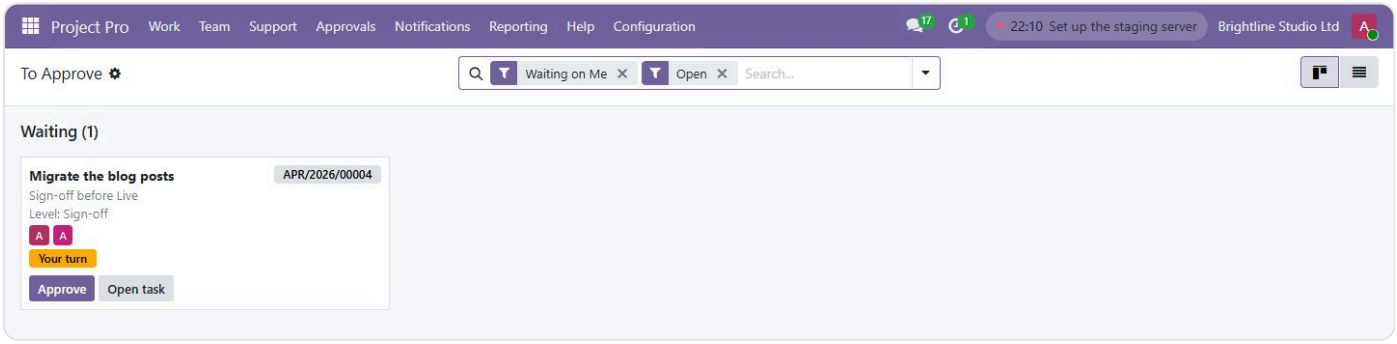

Levels run in order: level two opens only when level one is approved. **How many** is **Any one of them** or **All of them**; all of them is allowed on named people only, because a group has no fixed membership. If a level still resolves to nobody, the request says so plainly instead of sitting blocked in silence.

What a held move looks like

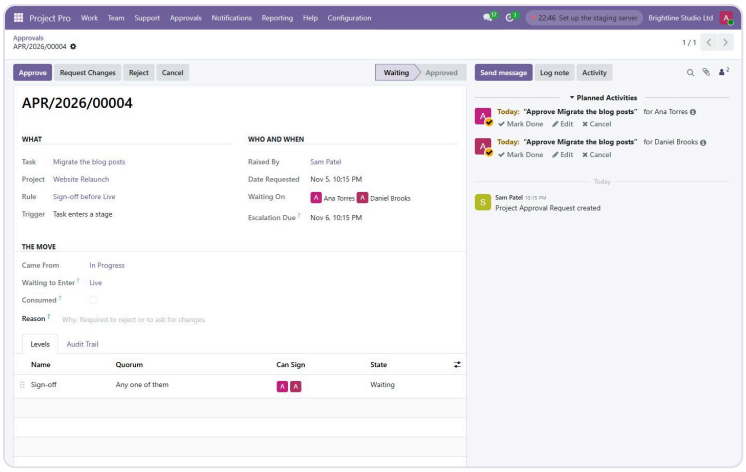

Drag a guarded item into Live, or change its stage anywhere else, and only the stage change is dropped from the save. The comment, deadline or assignee changed in the same save are kept. The request is raised with a number (APR/2026/00001), the chatter says the item is held and who it is waiting on, and each approver gets an Odoo to-do activity. While it waits, the item cannot change stage and cannot be marked done, from any screen.

Approvals, All Approvals, grouped by status. A card carries the item, the rule, the current level and the faces of who can sign. **Your turn** marks the ones you can act on, with **Approve** and **Open task** on the card.

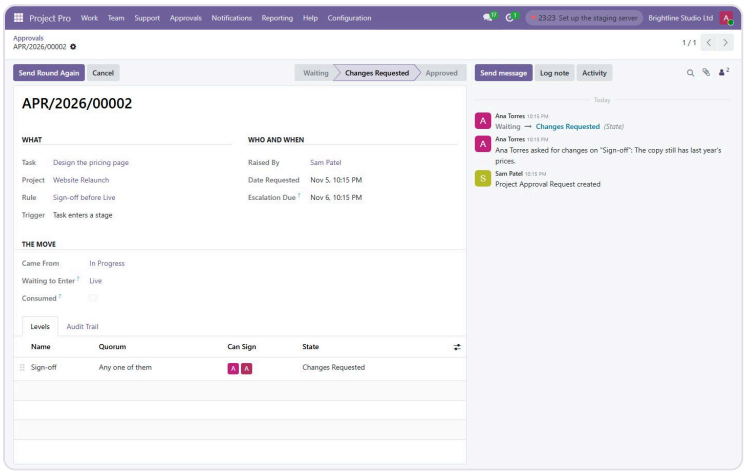

Approvals, To Approve: the same, filtered to Waiting on Me. Filters also offer Raised by Me, Open, Escalated, Past Escalation Time, Approved and Rejected.

1

Read the request

The request form: what (item, project, rule, trigger), who and when (raised by, on, waiting on, escalation due), the move (came from, waiting to enter), the **Levels** tab and the **Audit Trail**.

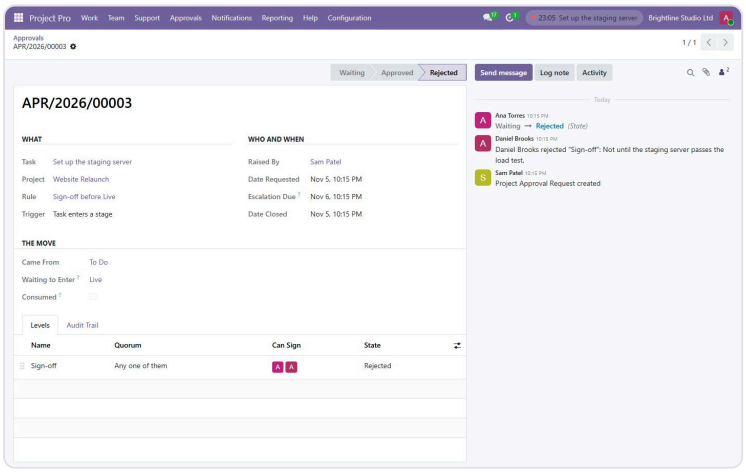

2

Request Changes

Type a **Reason**, then **Request Changes**. The item stays held and the requester is told. When they have changed it, **Send Round Again** reopens the level; signatures already given on it are marked superseded, because the item has changed since.

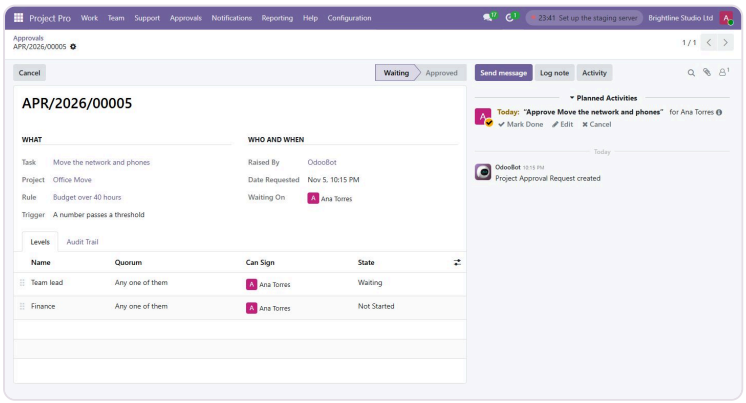

Reject and Request Changes both need a reason typed first.

3

Reject

Type a reason, press **Reject**. The item lands on the stage the rule names under If rejected, send it back to, or stays where it came from. Rejecting one rule cancels any other rule guarding the same move.

4

A threshold request

Raised by Budget over 40 hours when the allocated hours crossed 40. Two levels: Team lead (the project manager) and Finance. This rule does not block: it asks somebody to look and holds nothing.

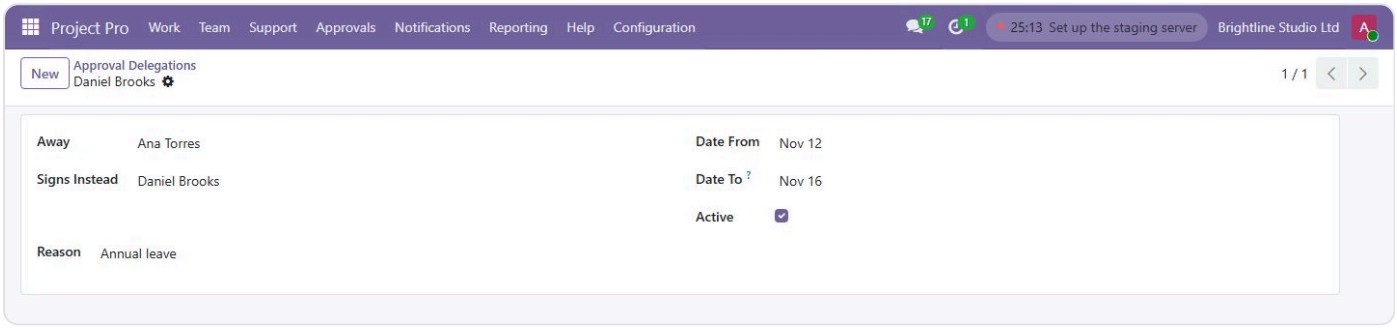

When the last level signs, the held move is applied and the approval is marked **consumed**, so the same signature cannot let the item through twice. Two rules guarding the same move both have to clear. **Cancel** withdraws a request.

Only one open request per rule per item can exist; that is a database index, so two people pressing the same button at once cannot raise two.

Escalation

A rule can name a fallback approver and a number of hours of silence. An hourly job hands a silent request to the fallback, who is added to the open level; the original approvers keep their say. Running the job twice never escalates twice.

Delegation while you are away

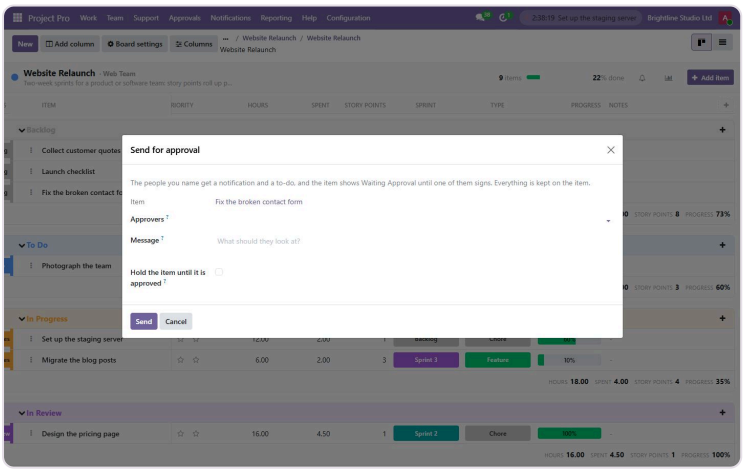

Approvals, Delegations: who is away, who signs instead, from and until, and a reason. An end date is required.

Delegating to yourself is refused, and so is a second delegation overlapping the first. Chains are followed: if the delegate is also away and has delegated, their delegate can sign. The audit trail records who pressed the button and on whose behalf.

The audit trail

Every decision is an entry: who, when, approve, reject or changes, the reason, and on whose behalf. The engine never edits or deletes an entry; one that no longer counts is marked superseded and stays. The approvers' to-do activities are cleared for everybody once a level is decided.

Ask from the item

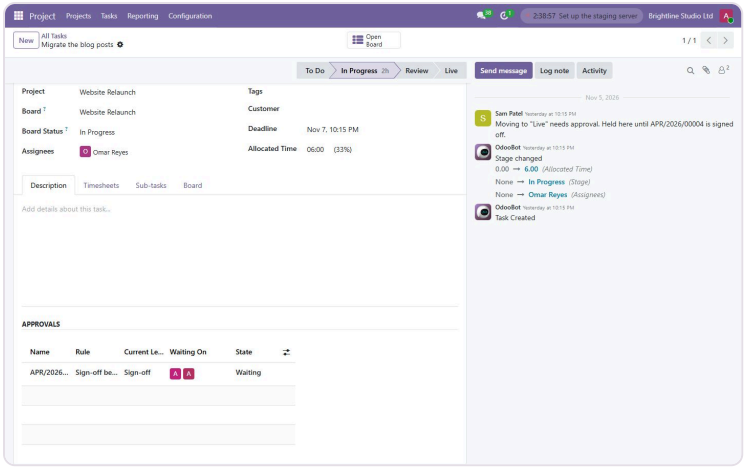

5

Send for approval

On any item, **Send for approval**: pick the **Approvers** (any one of them can sign), write a message, and tick **Hold the item until it is approved** if it must not move meanwhile. The request runs under the rule **Sign-off asked from the item**.

To require all of them, change the level of that rule to All of them.

6

On the task

The task form shows a banner with the approval state and a summary, with **Open the request**, and an **Approvals** section at the bottom listing every request on it.

PART 16 Automations, with a dry run

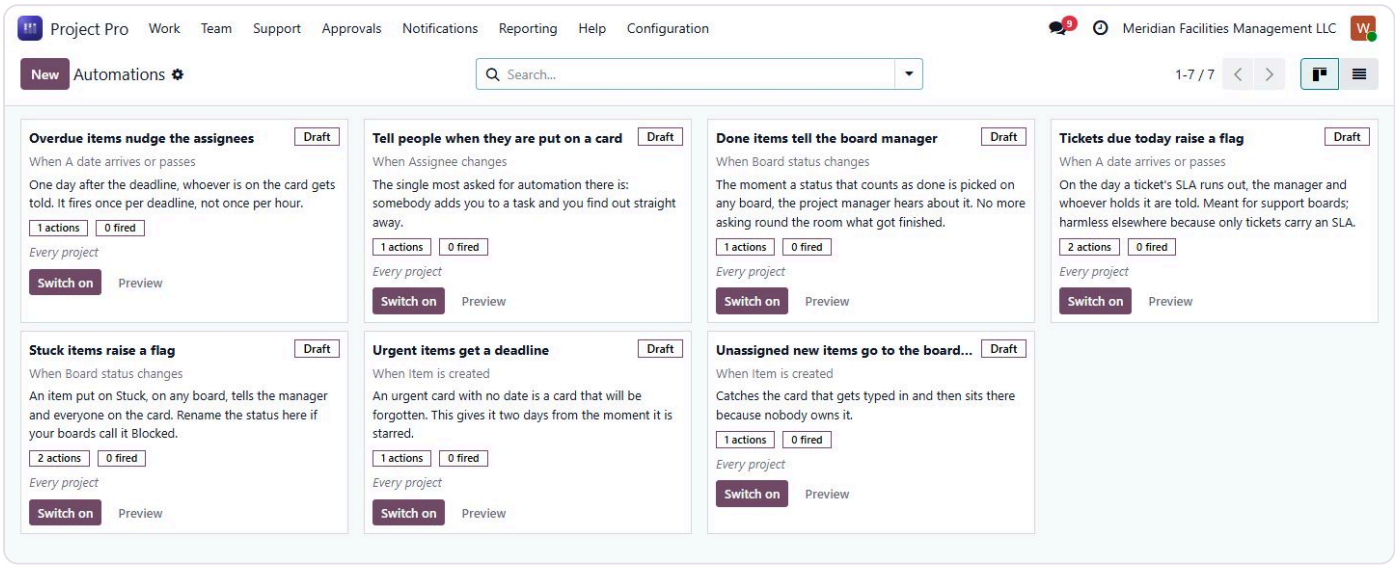

When this happens, do that. No code: eight triggers, seven typed actions, a dry run against real items before a rule goes live, and a log that answers why a task changed.

IN THIS PART YOU WILL LEARN

- The seven starter recipes and switching one on
- Every trigger and every action on the rule form
- Placeholders in messages
- The dry run
- The automation log, and the limits that stop a loop

TRY IT YOURSELF ON THE DEMO

1. Open Configuration, Automations and read the cards
2. Open Stuck items raise a flag and read When and Then do this

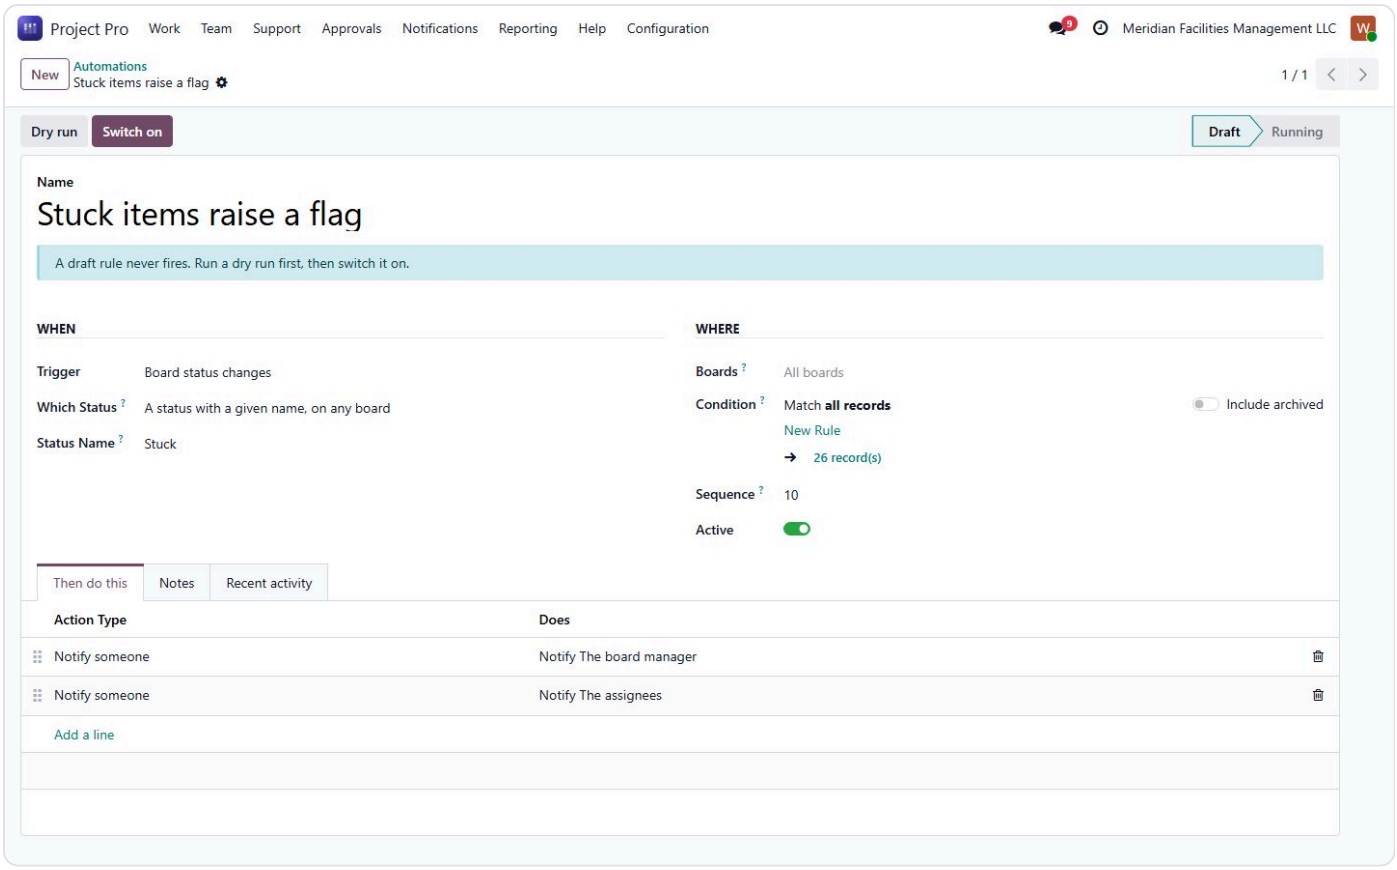

Configuration, Automations: each rule as a card with its state (Draft, Running, Paused), trigger, description, how many actions, how often it fired and failed, and the boards. Buttons on the card: Switch on, Pause and Dry run.

The starter recipes

Recipe	Trigger	Does
Overdue items nudge the assignees	A date passes: one day after the deadline	Notifies the assignees, once per deadline
Tell people when they are put on a card	Assignee changes	Notifies the people just added
Done items tell the board manager	Board status changes to one that counts as done	Notifies the project manager
Tickets due today raise a flag	A date arrives: the SLA deadline, today	Notifies the manager and the assignees
Stuck items raise a flag	Board status changes to one named Stuck, on any board	Notifies the manager and the assignees
Urgent items get a deadline	Item is created, with the priority star set	Sets the deadline two days out
Unassigned new items go to the board manager	Item is created with nobody on it	Notifies the project manager

All seven are installed in **draft**. None fires until somebody switches it on, because a rule that starts mailing people about two-year-old overdue tasks the moment a module installs is a rule nobody asked for. The New Project Board dialog switches the recommended ones on for the new project only.

A rule. Header: **Dry run**, **Switch on**, **Pause**, **Back to draft**. **When** holds the trigger and its details, **Where** the boards, the condition, the order and the batch size; tabs for **Then do this**, **Notes** and **Recent activity**.

The eight triggers

Trigger	Details you set
Item is created	-
Board status changes	Any board status; a status that counts as done; a status with a given name on any board; or one specific status of one board
Project stage changes	To a stage, optionally from a stage
Assignee changes	Optionally only when a named person is added
Item moves to another board	Optionally to a named project
A number crosses a threshold	The number, rising to or above, or falling to or below a value. Fires on the crossing only
A date arrives or passes	The date field, before, on or after, by so many days, and a catch-up window. Run hourly
An approval is decided	Approved, refused, or either

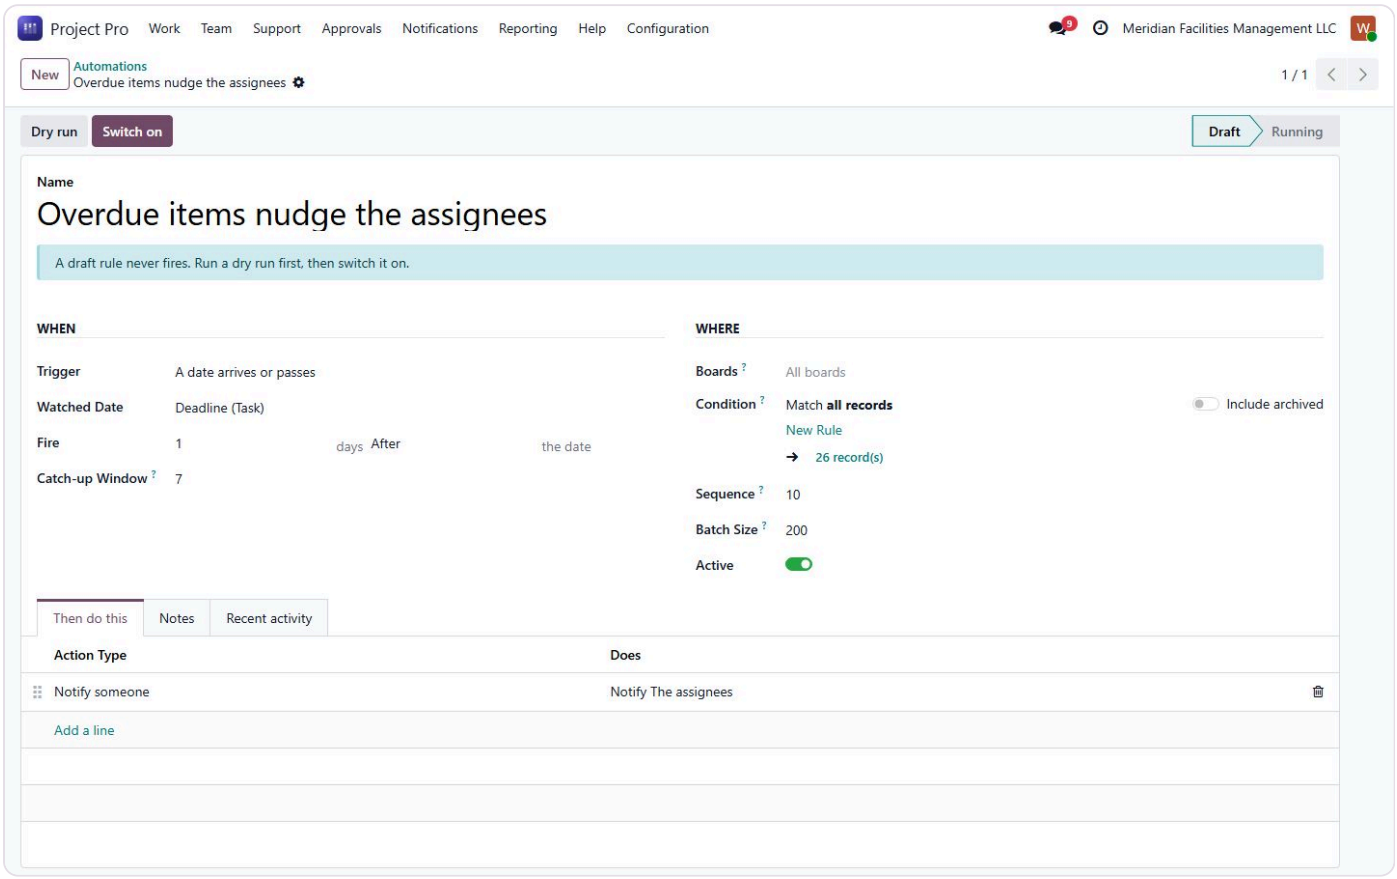

The **Condition** is a plain list of filters with literal values. Anything dynamic is refused on purpose: nothing in this engine evaluates text a user typed.

The seven actions, run in order

Action	Details
Set a column	Any task field: text, number, checkbox, date, option, link or tags; replace, add or remove

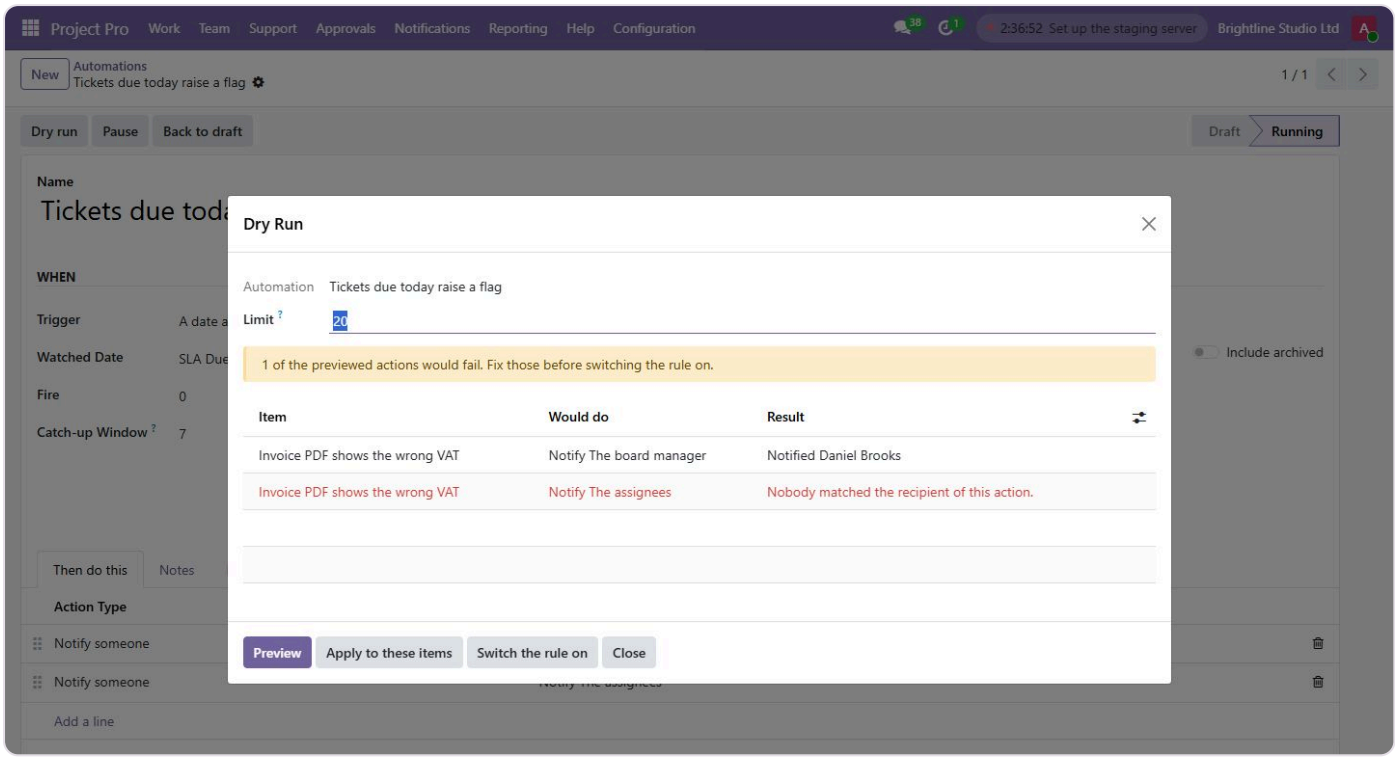

Assign people	Replace, add or remove people
Move to a board or status	Another project, a stage or a board status; a stage the target project does not use is refused
Create a subtask	A title, assignees and a deadline in so many days
Notify someone	The assignees, whoever created the item, the followers, the board manager, specific people, or everyone in a role; a subject and a message
Request an approval	An Odoo to-do activity for each named person or member of a role. It does not hold the item; an approval rule does that
Set a date from another date	The date to set, counted from another date, plus so many days

Subjects, messages and subtask titles take placeholders: **{name} {id} {stage} {project} {assignees} {deadline} {priority} {user}**. They are substituted, never run, so a stray brace cannot break anything.

A date rule: Overdue items nudge the assignees, watching the deadline, after, by one day.

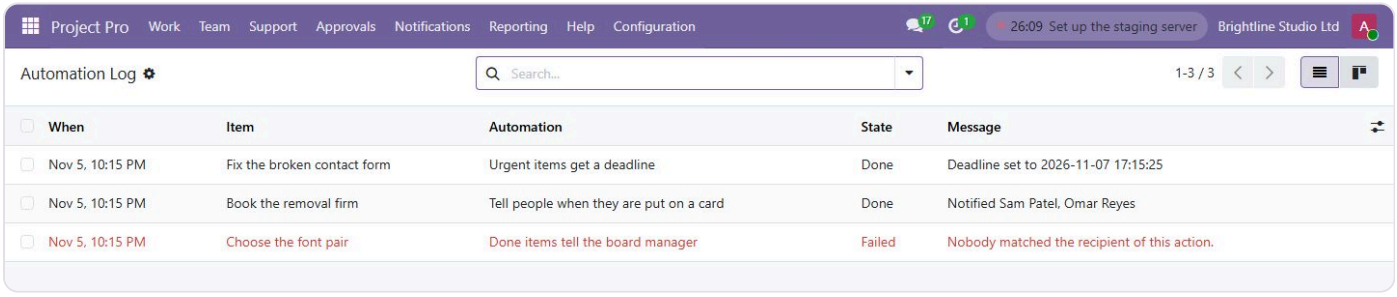

The dry run

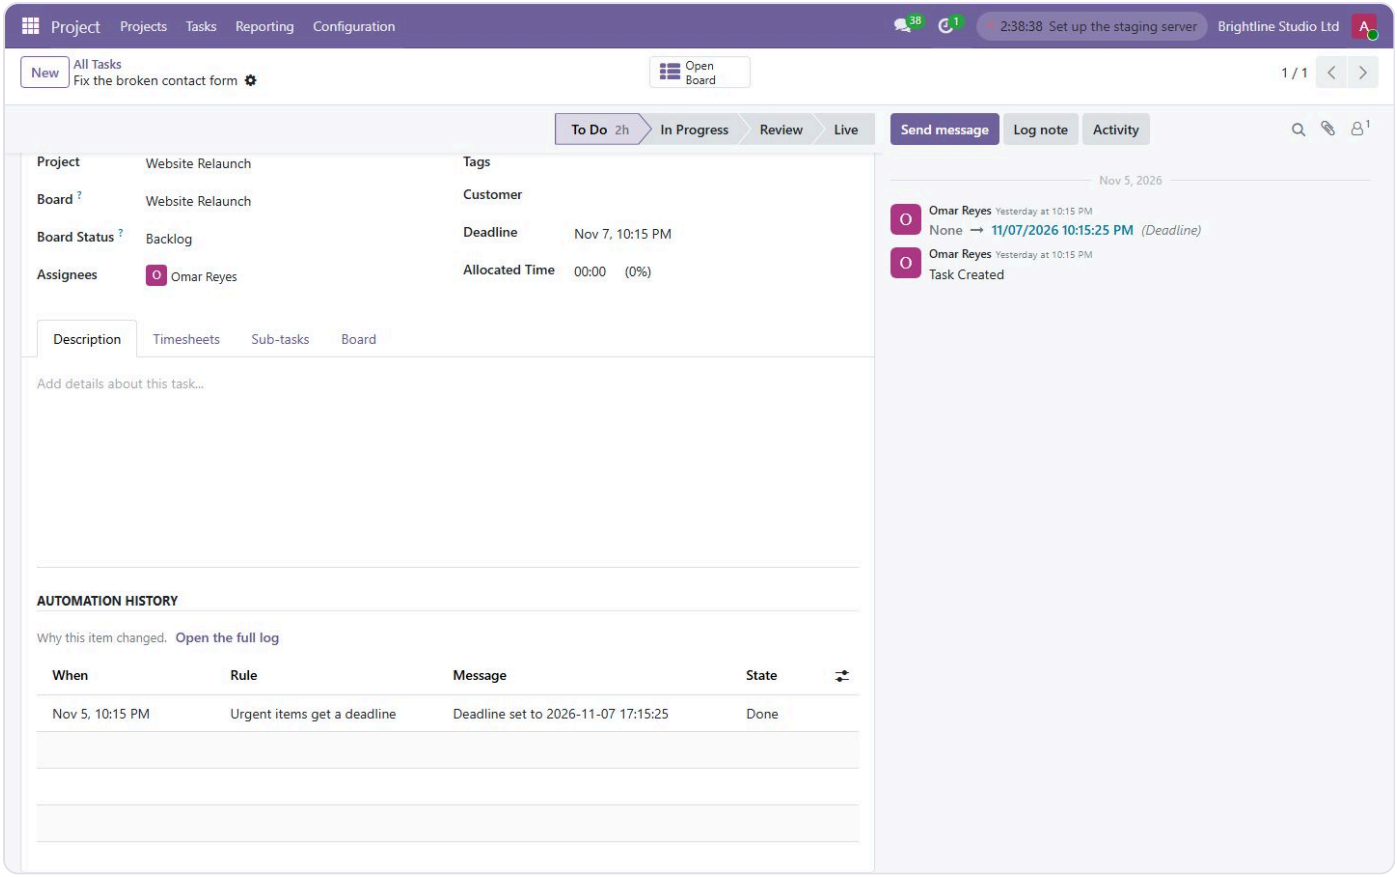

Dry run: how many recent items to try (20 unless you change it), then **Preview**. Per item and per action: **Would run** with the result, or **Would fail** with the reason. From the same window, **Apply to these items** or **Switch the rule on**.

The dry run goes through the same code as a real run with the writes switched off at the last moment, inside a transaction that is always rolled back. It changes nothing and creates no subtasks.

The log

Reporting, Automation Log (managers): when, the item, the rule, the result (Done, Blocked, Failed), the message, because, the action, the chain depth and the person whose edit set it off. Filters: Failed, Blocked, Set off by another rule.

At the bottom of the task form, the automation section lists that item's own rows; **Open the full log** shows them under the heading Why this item changed.

Why it cannot run away

A rule whose action changes the field its own trigger watches would loop. Every cascade is capped: at most 5 rules deep, at most 200 actions per edit, and one firing per rule per item per edit. Each action runs on its own, so a rule that fails rolls back its own action and nothing else; the save that set it off still stands. A draft rule never fires. The log is trimmed daily and keeps 90 days.

PART 17 Notifications people actually read

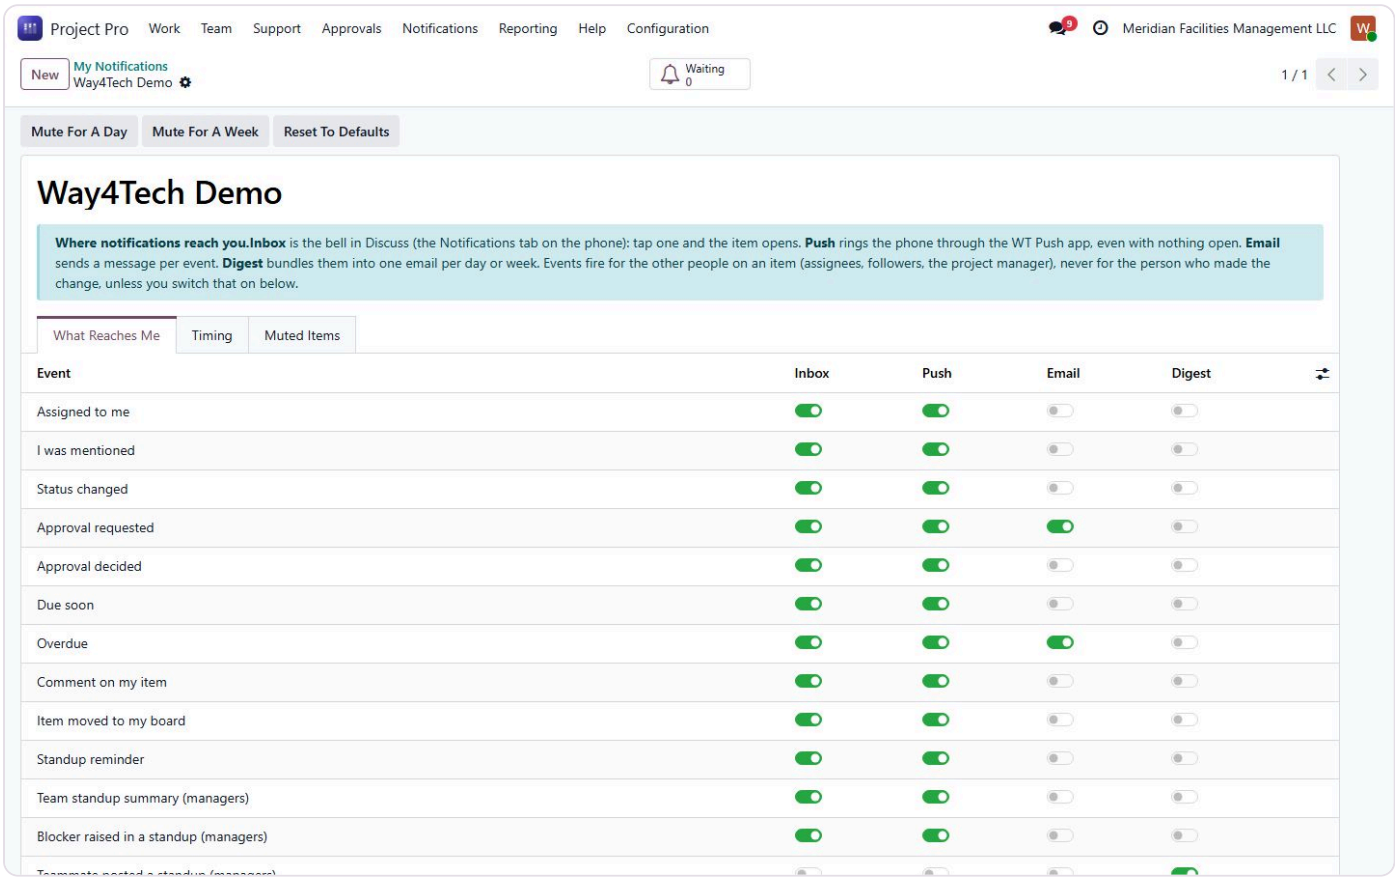

Everything Project Pro wants to tell somebody goes through one queue, and the recipient decides: per event, whether it reaches the Odoo inbox, email, the phone or a digest; when it is quiet; and what is muted.

IN THIS PART YOU WILL LEARN

- The seventeen events and the four channels
- Your own settings: the matrix, timing, quiet hours, mutes
- The feed and the queue
- Why a burst of edits is one message, not six

TRY IT YOURSELF ON THE DEMO

1. Open Notifications, My Settings and read the What Reaches Me matrix
2. Open the Timing tab and look at quiet hours

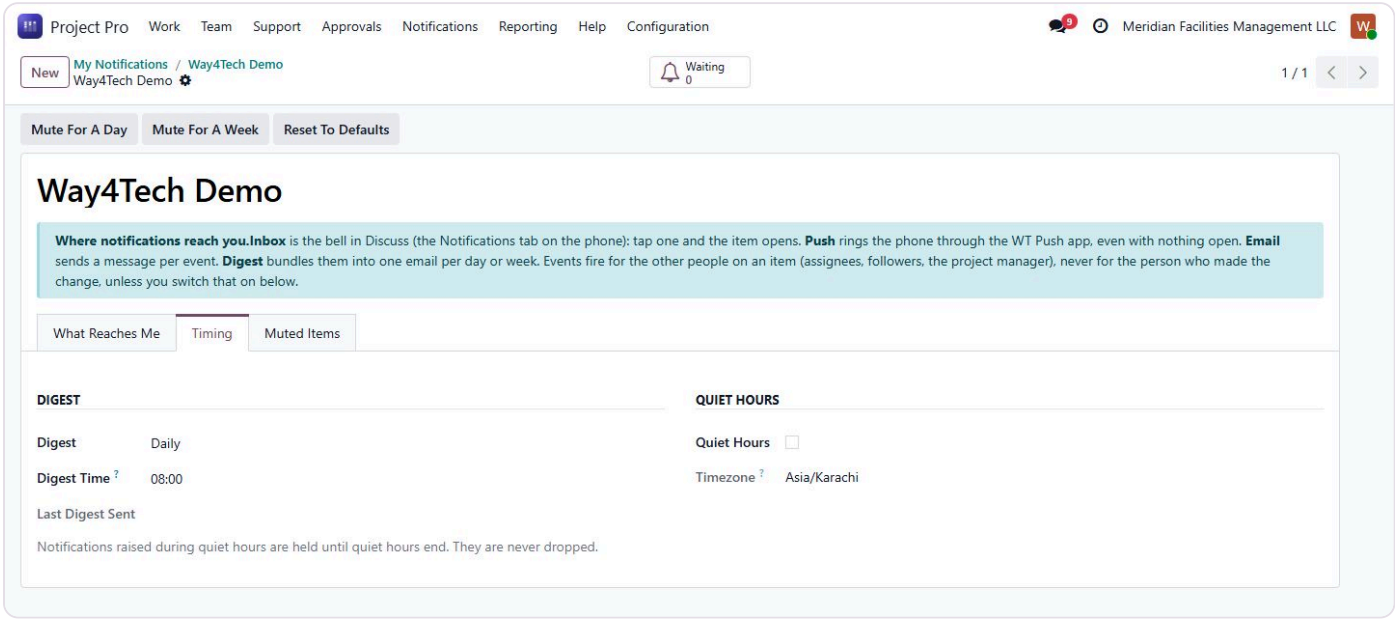

Notifications, My Settings. Across the top: **Mute For A Day**, **Mute For A Week**, **Unmute**, **Reset To Defaults**, and how many are waiting in the queue. The **What Reaches Me** tab is a matrix of events against Inbox, Push, Email and Digest.

Event	On by default
Assigned to me, I was mentioned, Status changed	Inbox, Push
Approval requested	Inbox, Push, Email
Approval decided, Due soon, Comment on my item, Item moved to my board	Inbox, Push
Overdue	Inbox, Push, Email
Standup reminder, Team standup summary, Blocker raised in a standup	Inbox, Push
Teammate posted a standup (managers)	Digest
Activity scheduled for me, Meeting invitation or starting soon	Push
Activity due today or overdue, Other project activity	Inbox, Push

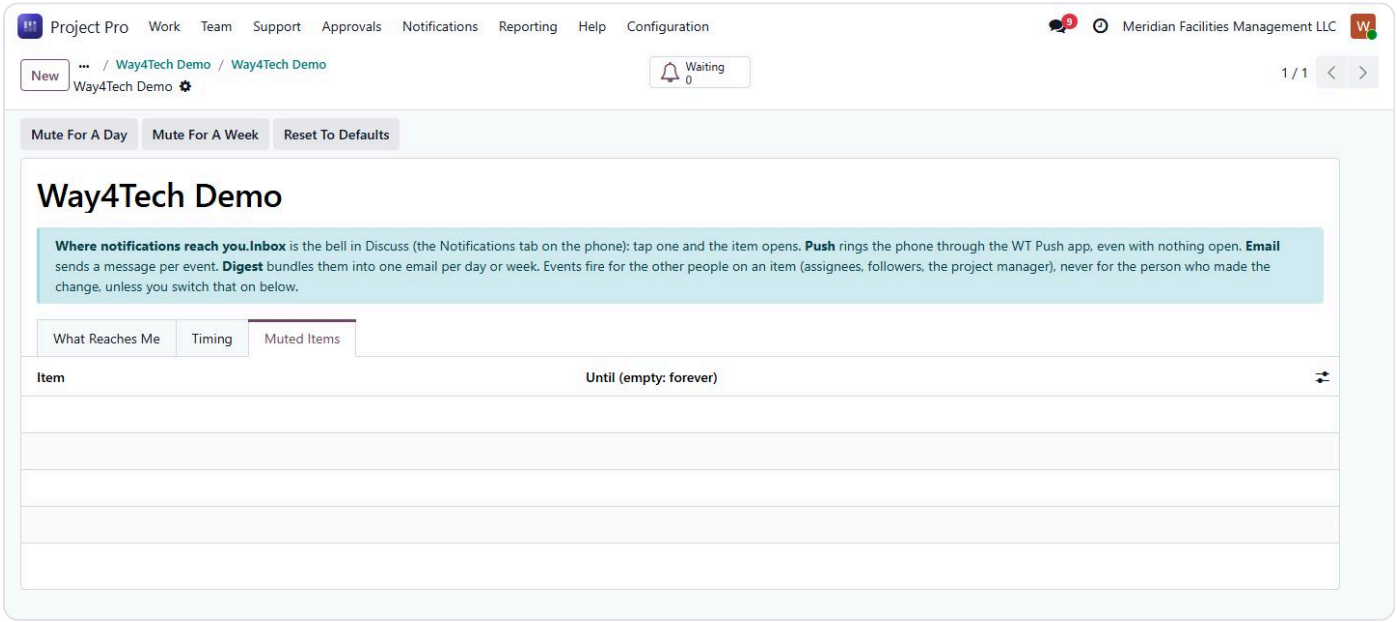

Every switch is the person's own. Below the matrix, **Notify me about my own actions** is off by default, because being told about what you just did is the most common complaint. The audience of a task event is its assignees, followers and project manager, minus whoever did it.

Channel	How it is delivered
Inbox	A real Odoo inbox notification, built so it does not send a second email behind the back of a person who asked for inbox only
Email	A queued mail that Odoo's own mail queue sends
Push WEB PUSH ADD-ON	Through the Web Push app when it is installed; skipped silently when it is not
Digest	Parked for the next daily or weekly summary

The **Timing** tab. **Digest**: none, daily or weekly, the day and the hour, and when the last one went. **Quiet Hours**: from and until in your own timezone, and whether urgent messages break through.

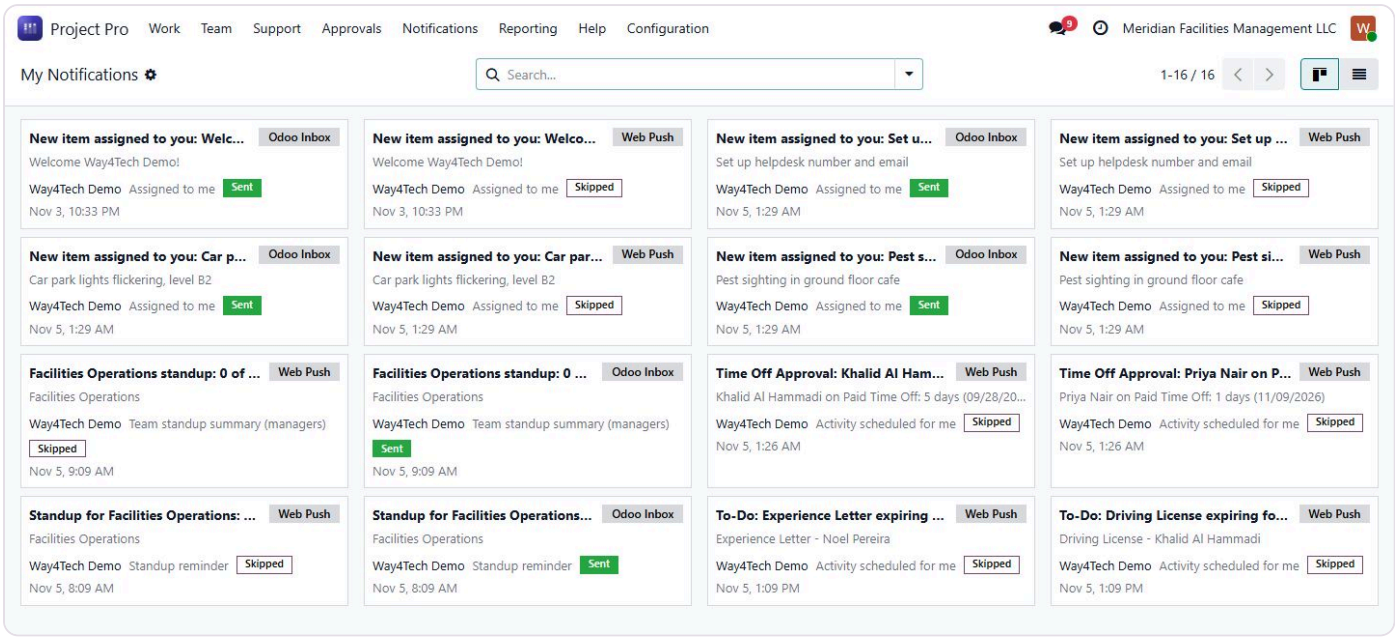

A notification raised inside quiet hours is scheduled for the moment they end, not dropped. The digest groups what happened by event with a link per item; a missed run is harmless, the next one collects everything. Switching the digest off reroutes whatever was parked for it to the inbox.

The **Muted Items** tab: the boards and items you muted with the bell, and until when (empty means until you unmute). **Unmute** on each row.

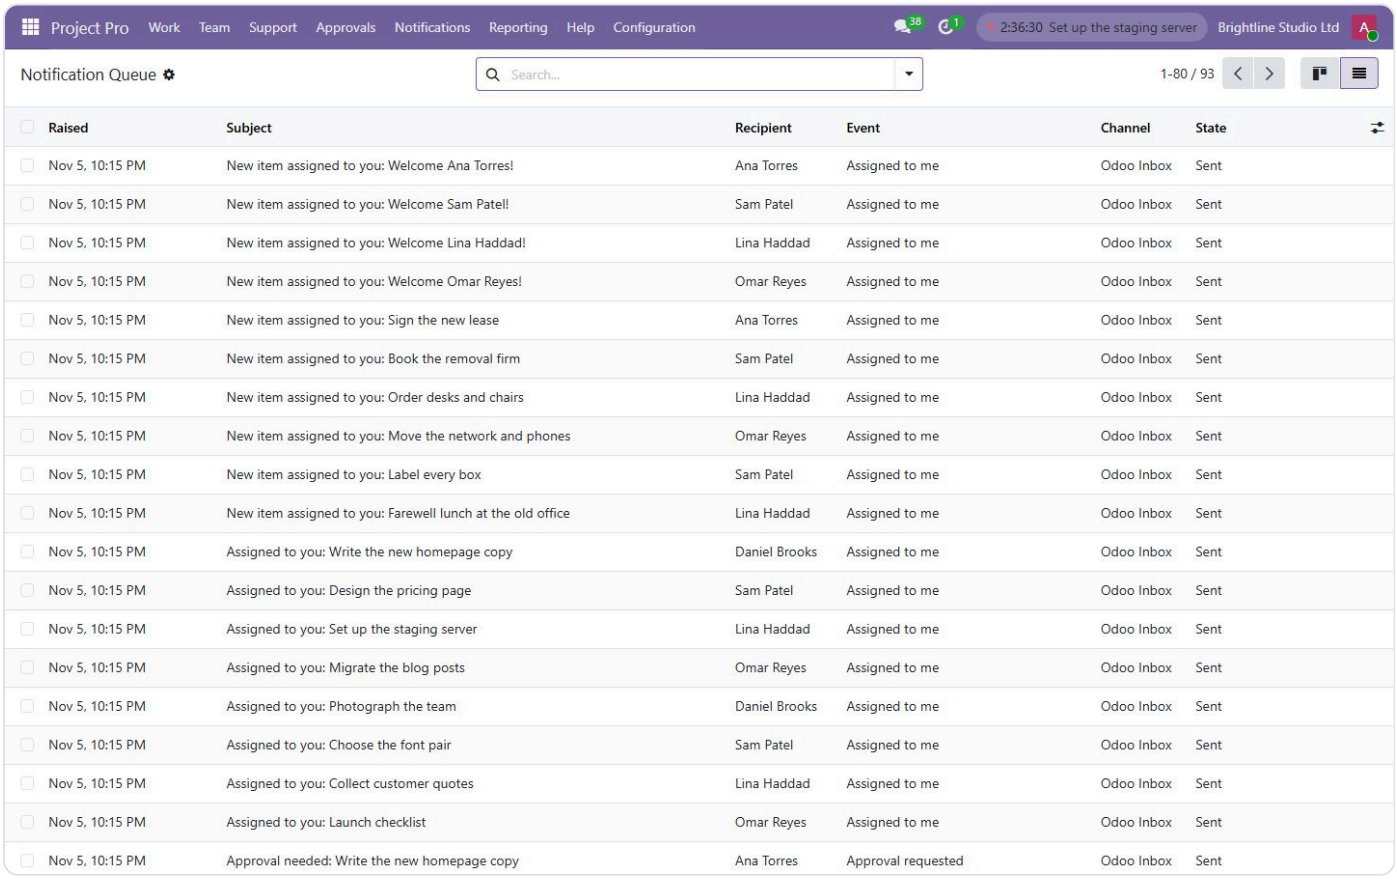

Mute For A Day and **For A Week** stop email and push for everything; the inbox and the digest still record what happened, so coming back from leave means a full inbox, not a hole.

The feed

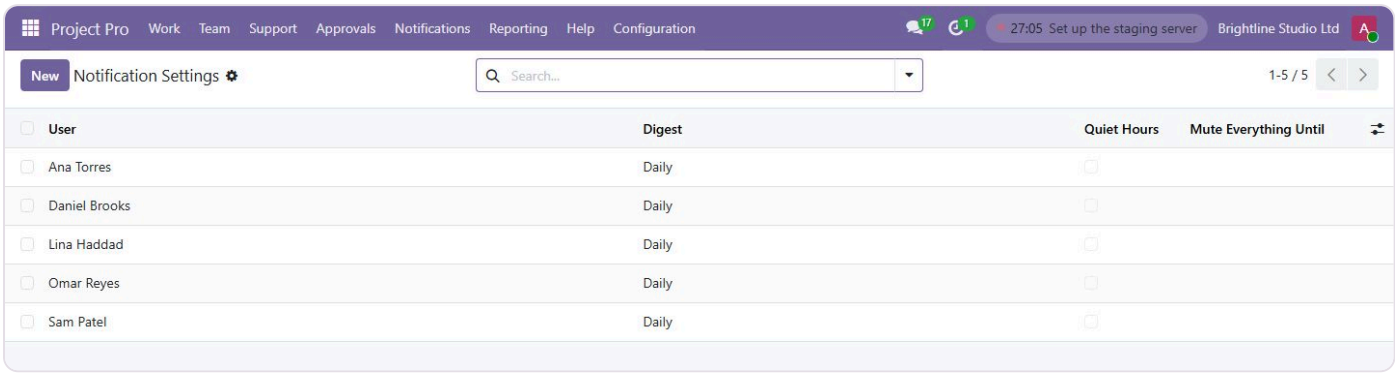

Notifications, My Notifications: your own feed as cards, each with the subject, the record it is about, who caused it, the event, the channel and its state.

The queue MANAGERS

Reporting, Notification Queue (administrators): every row, with raised, subject, recipient, event, channel, state (Waiting, Sent, Skipped, Failed, Cancelled), level, the record, who caused it, scheduled and sent times, merged events, attempts and the last outcome. Each row has Try again and Send now.

Queueing only writes a row; it never talks to a mail server or a push service, so a slow mail server cannot slow down saving a task. A job drains the queue every minute, 200 rows at a time, urgent first. A failed send is retried with a growing delay and gives up after five attempts, with the reason on the row. Sent rows are cleaned up after 30 days. Saving a task that changes five fields raises one notification; the same news about the same task within ten minutes merges into the row already waiting.

Configuration, Notification Settings (administrators): everyone's settings, with their digest, quiet hours, mute and how many are waiting.

PART 18 Background jobs and system settings

Nine scheduled jobs keep the engines moving. They are ordinary Odoo scheduled actions, visible to an administrator under Settings, Technical, Scheduled Actions.

Job	Runs every	What it does
Project Pro: Deliver Notifications	1 minute	Sends waiting queue rows, urgent first, in batches
Project Pro: Send Notification Digests	1 hour	Sends each person their digest when it is due in their timezone
Project Pro: Scan Due Dates	1 hour	Raises Due soon (two days ahead) and Overdue (once a day)
Project Pro: Clean Up Notification History	1 day	Deletes sent rows older than the retention
Project Pro: Escalate Silent Approvals	1 hour	Hands silent requests to the fallback approver
Project: run date automations	1 hour	Runs the A date arrives or passes rules
Project: trim the automation log	1 day	Keeps 90 days of log
Project Pro: Standup Reminders	10 minutes	Reminders before the standup, the summary after it
Project Pro: Activities and Meetings	10 minutes	Activities due and meetings starting soon, to the right person

System parameters

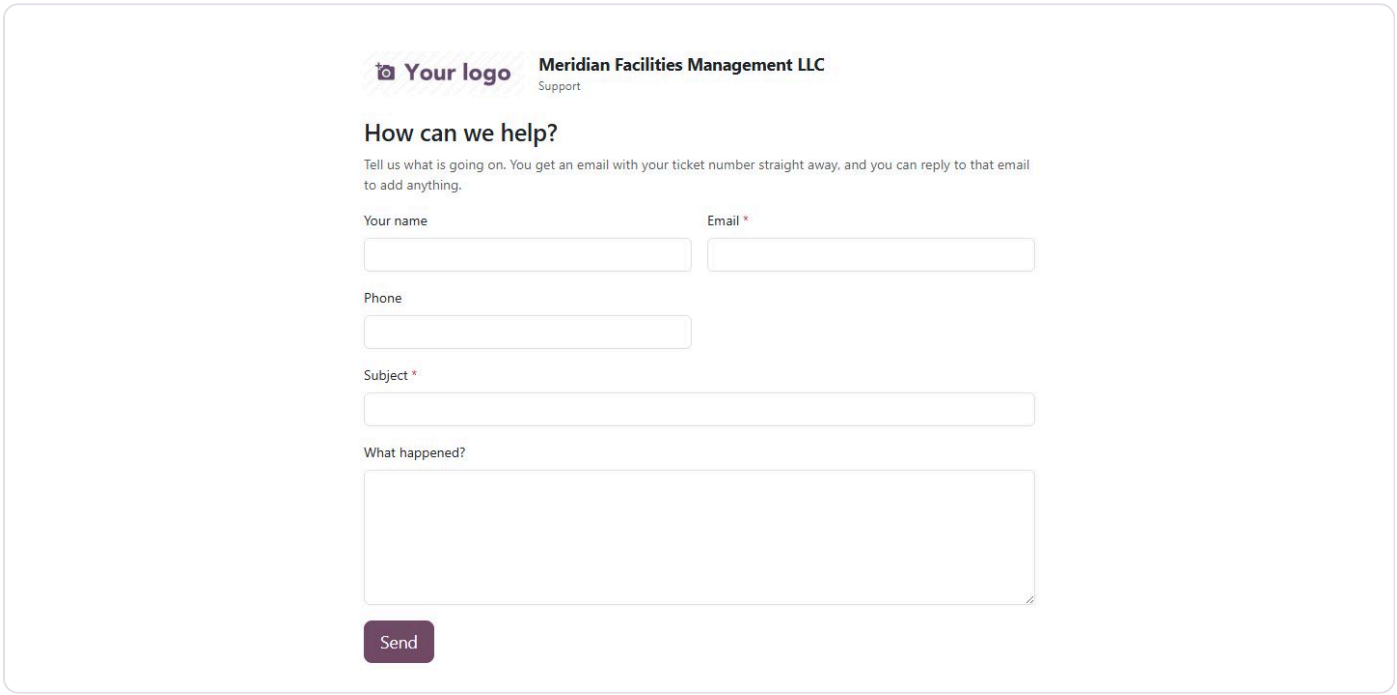

Parameter	Default	Meaning
wt_project_pro.notify_batch_size	200	Rows delivered per run
wt_project_pro.notify_max_attempts	5	Attempts before a row is marked failed
wt_project_pro.notify_vacuum_days	30	Days sent rows are kept
wt_project_pro.notify_due_soon_days	2	How far ahead Due soon warns
wt_project_pro.notify_dedupe_seconds	300	The merge window for general events (task edits use ten minutes)
wt_project_pro.automation_log_retention_days	90 (not set)	Days of automation log kept

PART 19 Mails and pages it sends out

Project Pro prints no PDF reports of its own; a project is read on screen. What leaves the system is mail and two public pages, all in the company's name.

What	Who gets it	When
Notification email	The person whose matrix has Email on for that event	Within a minute of the event, outside their quiet hours
Digest email	People with a daily or weekly digest	At their chosen hour, grouped by event with a link per item
Ticket acknowledgement	The customer	When a ticket is created, with its number (Acknowledge new tickets by email)
Status change mail	The customer	At each status change of a ticket (Tell the customer when the status changes)
Inbox notification	Internal users	In Odoo's own inbox, per their matrix
Push message WEB PUSH ADD-ON	Internal users on their phone	Per their matrix

Every customer mail closes with the board's **Signature on customer mail** and, when the board gives customers a ticket page, a link to it. Robot mail is signed by the company, not by OdooBot.

The public support form at **/support/new**, on the live demo. It uses the company name and logo and needs no Website app.

PART 20 A 15-minute demo script

Showing Project Pro to a team for the first time? This order tells the story: the day, the board, the views, then the three engines. Sign in to the live demo as w4demo / Demo2026.

Minute	Open	Show	Say
0-2	Project Pro, Home	My Day, the standup boxes, your teams today	"This is where each person starts the day. Nothing here is configuration."
2-5	Work, Boards, Mobilisation Plan	Lanes in colour, the status pill, a custom column, the totals, Add item	"Every row is an ordinary Odoo task. The lanes are your statuses, not the stages."
5-6	The expand icon on a row	The item dialog: verbs, board values, comments	"Timer, log time, an activity for someone, all on the item."
6-7	Work, Timeline, then Workload	Bars by person, today line; hours against capacity	"A gantt and a load view on Community, no Enterprise needed."
7-9	Support, Tickets	SLA pills, channels, filters; /support/new in a private window	"A ticket queue is just a board of kind Support."
9-11	Approvals, Set up a rule	The four questions and the plain-words sentence (Cancel at the end)	"A held task cannot move from any screen until it is signed."
11-13	Configuration, Automations	The recipes in draft, a rule form, the Dry run button	"You see what a rule would do before it does it."
13-15	Notifications, My Settings	The matrix, quiet hours, mute for a day	"Each person decides what reaches them, so nobody switches it all off."

> On the shared demo, open dialogs and Cancel or Discard them. Do not press Finish in the setup wizard, Create the rule, Switch on, or Post standup, so the next visitor finds the same state.

PART 21 Questions people ask

Question	Answer
Does it need Odoo Enterprise?	No. It depends only on Project, Discuss and the web client, all in Odoo 19 Community. The timeline and workload are written inside the module.
Will it change my existing projects and tasks?	It works on the same tasks. Every existing project gets a board with the starter statuses; tasks keep their stages, timesheets and chatter. Uninstall it and they are as they were.
Is a board status the same as a stage?	No. Stages are Odoo's and stay as they are. The board status is the board's own column. An automation or approval can watch either.
Can clients see the board?	No. A customer on a support board can follow their own ticket on its private page. Portal users are never sent internal notifications.
Can we use a custom column in a list, pivot or filter?	No. Board columns are stored per board, not as fields of the task, so they live on the board. The task form shows them read-only on the Board tab.
How big can a project get?	Opening a board is one grouped count plus one page of 40 rows per lane, whether the project holds 200 tasks or 50,000, and a value is stored only when somebody types one.
Do we need the timer?	Only if you want it. Without the Timesheets app the time buttons and columns are not shown.
Do we need the push add-on?	Only for messages on the phone. Without it, notifications go to the inbox, email and digests.
Can an automation run code?	No, on purpose. Seven typed actions, and conditions with literal values only.
What if the approver is away?	They record a delegation with an end date; the delegate signs and the audit trail says on whose behalf. A rule can also escalate after so many hours.
Why did this task move?	Open the task and read the automation section at the bottom, or press Open the full log: every firing, block and failure with the rule and the person whose edit set it off.
Is there a phone app?	The screens work in the phone browser: boards become cards, the timeline an agenda. With the Web Push app, notifications also ring the phone.

PART 22

Menu map

Every Project Pro menu and what it opens.

Work

Home	Your day: My Day, the standup, your numbers, every board
Boards	Every work board as a card, with its done percentage
All Items	Every board item in one board view, grouped by project
Timeline	A gantt style chart of the items, by person or project
Workload	People against weeks: hours booked against capacity

Team

Standups	One team, one day: posted, missing, out, blockers
My Time	A week grid of your hours, a row per item
Team Hours	Timesheet pivot per person per week (managers)

Support

Tickets	Every ticket on every support board
Support Boards	The ticket queues, with open and breached counts

Approvals

To Approve	Requests waiting on you
All Approvals	Every request, open or decided
Set up a rule	A short form that writes an approval rule (managers)
Rules	The approval rules in full (managers)
Delegations	Who signs for you while you are away

Notifications

My Notifications	Your own feed
My Settings	What reaches you, how, and when

Reporting

Standup Log	Every standup posted
Automation Log	Every rule firing, block and failure (managers)
Notification Queue	Every notification row (administrators)

Help

Guide	The manual inside the app, with Show me and sample data
Set up in three minutes	Team, first board and support, in one pass (managers)

Configuration

Teams	Manager, members, standup time and channel
Board Templates	The nine starting points and your own
Automations	The rules and the seven starter recipes
Board Settings	Every board record, its layout and support settings
Columns	Every board column and its options
Notification Settings	Everyone's notification settings (administrators)

Want this for your team?

We install Project Pro on your Odoo 19 Community server, set up your teams, boards, statuses and columns from the way you work now, write your first approval rules and automations with you, connect your support mailbox and train your managers. Add our Web Push app and the same notifications ring each person's phone.
