COMPLETE GUIDE · CONNECT, SYNC AND RUN SHOPIFY FROM ODOO

Shopify Connector for Odoo 19

Products, prices and stock out to Shopify; orders, customers, refunds and payouts back into Odoo, with fulfilment, reconciliation and reports. One store or many, every screen and every step, no Odoo background needed.

START

About this guide

Shopify is where customers buy. Odoo is where the stock, the deliveries, the invoices and the accounts live. This connector keeps the two in step, inside your own Odoo, with no middleware in between. This guide walks every screen of it on a live demo.

Who it is for

The store owner or operations manager who connects the shop, the warehouse that ships the orders, the accountant who reconciles payouts, and whoever looks after the sync.

How to read it

Parts 1 to 3 explain and open the demo. Parts 4 to 11 set a store up from zero. Parts 12 to 20 are the day to day: orders, deliveries, refunds, payouts, the queue and reports.

The live demo

Northwind Outdoor Supply, a demo store that answers from an offline copy of Shopify: 14 products, 10 customers, 40 orders, deliveries, refunds, payouts, abandoned carts, collections, discount codes and a queue with failed jobs. It is reset every night.

HOW IT WORKS

The demo

Address	**shopify-test.way4tech.com**
Sign in	**demo** / **demo**
Store	Northwind Outdoor Supply, a demo store with no real Shopify behind it
Runs on	Odoo 19, module version 19.0.5.9.0

In the screenshots the store's Shopify address is shown as your-store.myshopify.com, and keys and secrets are hidden. Your own store's address goes in those places.

PART 4 Create the app in Shopify

PART 5 Connect the store

PART 6 Sync behaviour: what runs by itself

PART 7 Locations, warehouses and the stock Shopify shows

PART 8 Products, prices and publishing

PART 9 Customers, webhooks and metafields

PART 10 Accounting, payments, shipping and workflow rules

PART 11 The first import, with a dry run

PART 12 Orders from Shopify

PART 13 Deliveries, fulfilment and tracking

PART 14 Refunds both ways

PART 15 Payouts, fees and reconciliation

PART 16 Abandoned checkouts, collections and discount codes

PART 17 The queue and the logs

PART 18 Dashboard, alerts and the daily digest

PART 19 Reporting

PART 20 Schedules, the demo store and upgrading

PART 21 A fifteen minute walk-through

PART 22 Questions

PART 23 The menu map

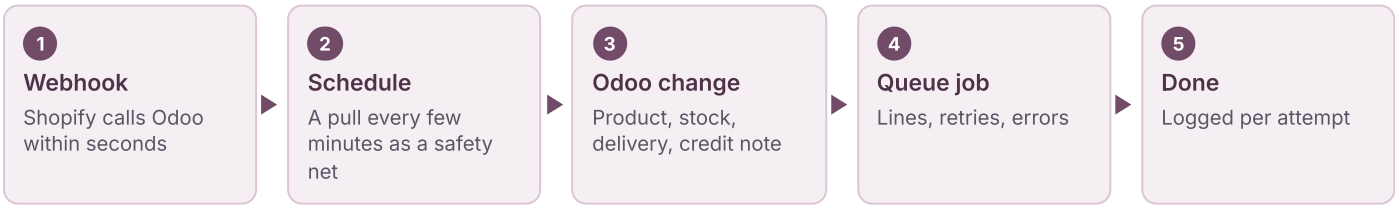

PART 1 What the connector does

Each kind of record has a direction. Odoo owns the catalogue it sends and the stock; Shopify owns the orders customers place. The table is the whole design in one page.

RECORD	DIRECTION	HOW
Products, variants, images, SEO, publish state	Both ways	Export from Odoo, import and webhooks from Shopify; changes from Shopify never bounce back
Prices and compare-at prices	Odoo to Shopify, and recorded from Shopify	From a pricelist per store, or Odoo's sales price
Stock per location	Odoo to Shopify (and a pull)	Free, on hand or forecast quantity, with a percentage, an offset and a minimum
Customers	Both ways	Matched on email, optionally on phone
Orders	Shopify to Odoo	Lines, shipping, taxes, discounts, currency, addresses, risk, edits; workflow rules confirm, invoice and pay
Fulfilment and tracking	Odoo to Shopify, and Shopify to Odoo	A validated delivery fulfils the order; a fulfilment made in Shopify validates the delivery
Refunds	Both ways	A Shopify refund makes a credit note and a return; a posted credit note can refund in Shopify
Payouts and fees	Shopify to Odoo	Statement lines, transactions, fee entries, matching to invoices
Abandoned checkouts, collections, discount codes	Shopify to Odoo	Imported; a checkout can become a CRM lead
Metafields	Your choice per field	Mapped to Odoo fields of products, variants, orders and customers

How a change travels

Three paths, one queue

Every sync, whichever way it starts, becomes a job in the queue. A job has a line per record saying what went through and what Shopify refused, it is retried with back off, and when it runs out of retries it raises an alert. Nothing fails quietly.

What it needs

Odoo 19 Community or Enterprise with Sales, Inventory, Accounting (Invoicing), CRM and Delivery, and Manufacturing only if you sell kits. For webhooks, Odoo must be reachable by Shopify over HTTPS at its web.base.url; an Odoo on a local network still works through the schedules. A Shopify store on any plan, and a login that can create an app.

PART 2 The menus at a glance

The connector adds a Shopify app to the main menu and a Shopify tab to sales orders, products, contacts and deliveries.

Shopify

Dashboard	Live view: issues, jobs running, revenue, queue health, top products, recent orders
Stores	Every connected store: connection, defaults, sync behaviour and mappings
+ Connect new store	The setup wizard: OAuth or access token, test, first imports

Shopify, Configuration

Metafield Mappings	Shopify metafields to Odoo fields, per store, one way or both

Shopify, Operations

Import from Shopify	Products, orders or customers, since a date, with a dry run
Queue Jobs	Every sync as a job with lines, retries and the error
Logs	One line per attempt, groupable, exportable to CSV

Shopify, Commerce

Refunds	Shopify refunds with their credit note and return, both directions

Shopify, Data

Payouts	Shopify Payments payouts, fees and reconciliation
Payout Transactions	Every charge, refund and adjustment behind the payouts
Abandoned Checkouts	Carts left at checkout, with a CRM lead
Product Mappings	One row per product per store
Customer Mappings	One row per contact per store
Collections	Custom and smart collections
Discount Codes	Price rules and their codes

Shopify, Reporting

Sales Analysis	Shopify orders by store, status, month
Refunds by Month	Refunded amounts per store
Payout Report	Payout transactions, fees and nets
Net Profit by Store	Revenue less product cost less Shopify fees
Shopify Tax Report	Tax collected on Shopify orders, net of credit notes

Inside other apps

Sales order, Shopify tab	Store, Shopify ids, statuses, fulfillment orders
Product, Shopify tab	Catalogue attributes and one row per store
Contact, Shopify tab	Shopify ids per store
Delivery, Push fulfilment	Tracking and the Shopify location

Who sees what

ACCESS LEVEL	WHAT IT ALLOWS
Shopify User	The Shopify menu, the dashboard, stores, the queue, logs, data and reports
Shopify Manager	Everything a user can, and connecting stores and changing their configuration

Every record the connector creates carries its store, and record rules keep each company to its own stores, jobs, logs, payouts, refunds and mappings.

PART 3 Open the demo and sign in

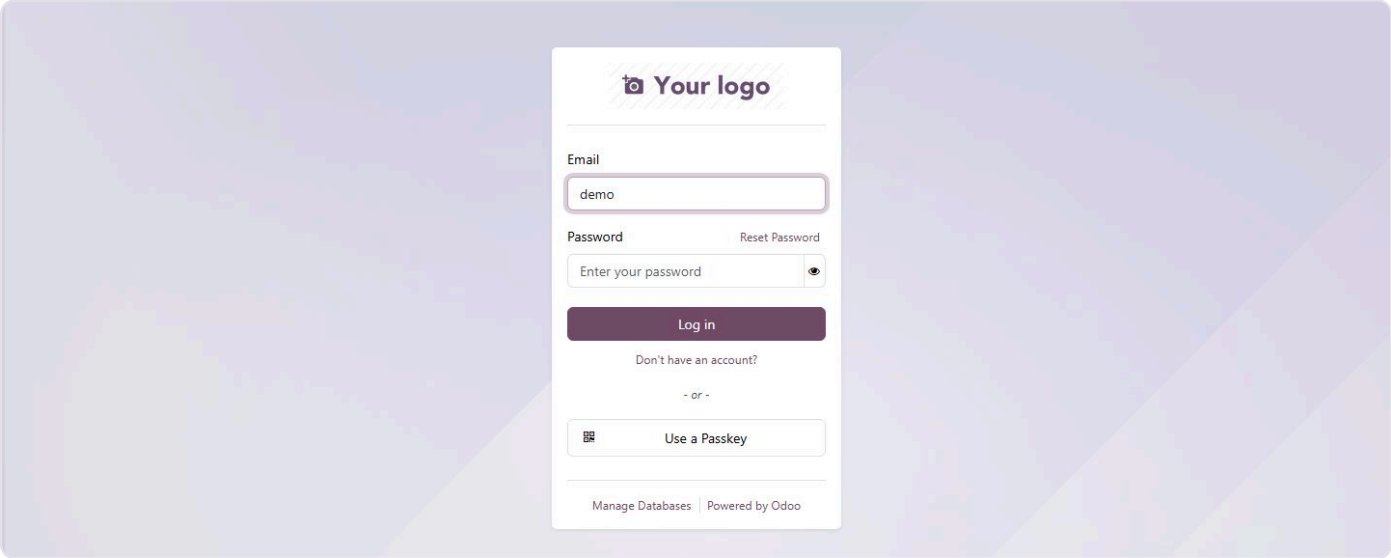

TRY IT YOURSELF

1. Open shopify-test.way4tech.com
2. Sign in with demo and demo
3. Click Shopify in the main menu

1 Sign in

Open **shopify-test.way4tech.com** and sign in with `demo` and `demo`. The demo user is a Shopify manager with sales, stock and invoicing rights, so every screen in this guide opens.

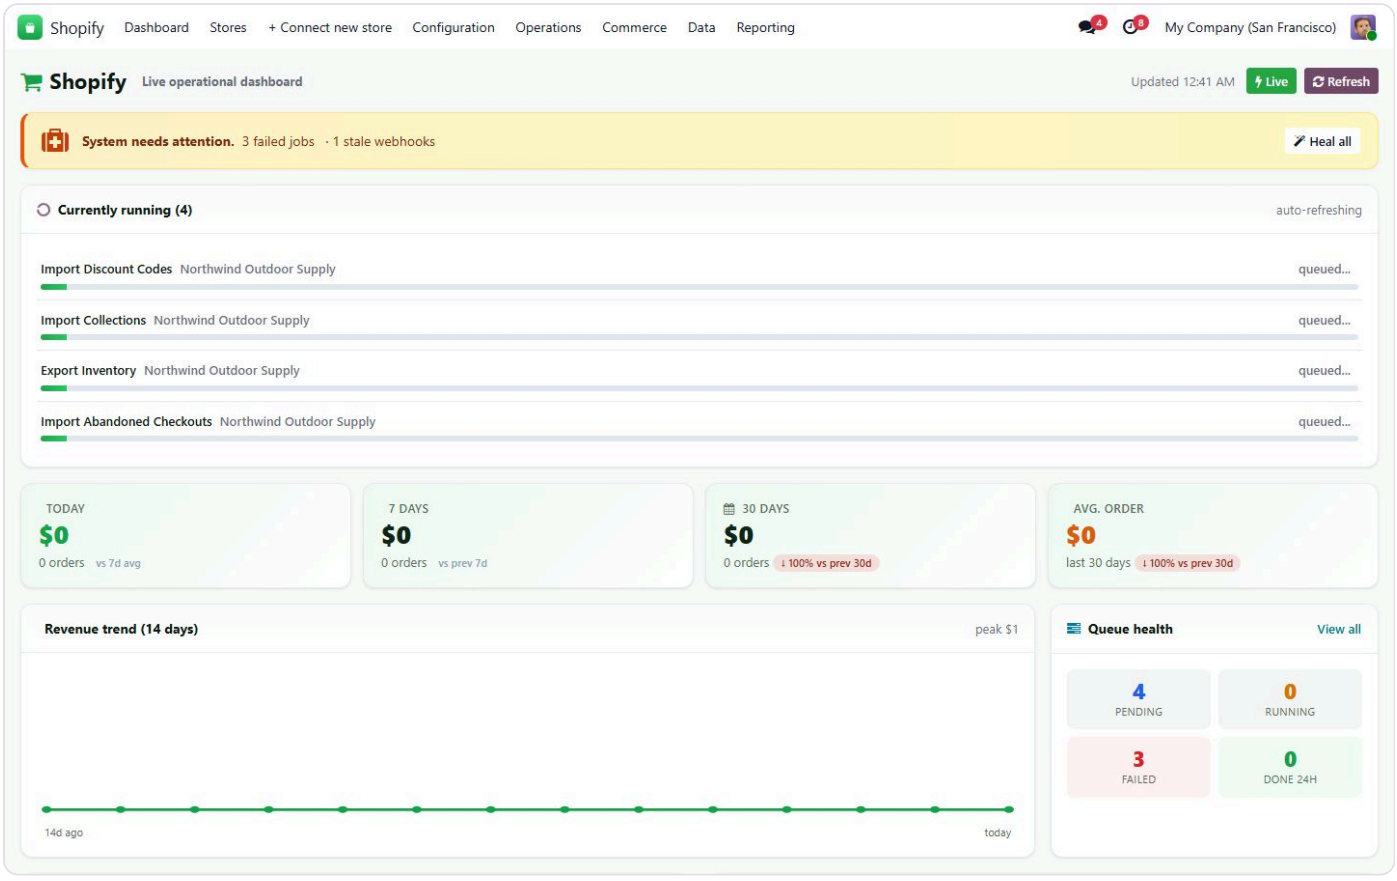

> The demo is shared and is reset every night at 03:00. Anything you change is put back.

2 The dashboard

Shopify opens on the **Dashboard**: a banner when the system needs attention (here 3 failed jobs and 1 stale webhook) with **Heal all**, the jobs currently running, revenue today, over 7 and 30 days and the average order, the revenue trend, queue health (pending, running, failed, done in 24 hours), top products and recent orders. It refreshes itself; **Refresh** does it now.

> Heal all retries every failed job and registers again the webhooks in error.

PART 4 Create the app in Shopify

Odoo talks to Shopify through an app that you create for your own store. The setup wizard in Odoo explains each click; this part is the list of what the app must be allowed to do.

Two ways to connect

METHOD	WHAT YOU CREATE IN SHOPIFY	WHAT ODOO NEEDS
OAuth install (recommended)	An app in the Shopify Dev Dashboard, with Odoo's address as its App URL and redirect URL	The Client ID and Client secret; Odoo then sends you to Shopify to approve the install
Admin API access token (legacy custom app)	A custom app in the Shopify admin: Settings, Apps and sales channels, Develop apps	The Admin API access token (shown once) and the API secret key, which signs webhooks

The access scopes

SCOPES	USED FOR
read_products, write_products	Products, variants, images, collections, product metafields
read_orders, write_orders	Orders, risks, cancellations, refunds, order metafields
read_customers, write_customers	Customers and their metafields
read_inventory, write_inventory	Stock levels per location
read_locations	Locations
read_fulfillments, write_fulfillments	Fulfilments and tracking
read/write_merchant_managed_fulfillment_orders	Which location ships an order, and moving it
read/write_third_party_fulfillment_orders	Only if a fulfilment app (a 3PL) ships for you
read_publications, write_publications	Publishing products on the Online Store over GraphQL
read_shopify_payments_payouts	Payouts
read_checkouts	Abandoned checkouts
read_price_rules, read_discounts	Discount codes

A missing scope shows up later as a failed job with Shopify's 403 message naming the scope. Add it to the app and install it again.

PART 5 Connect the store

The setup wizard takes the credentials, tests them, and runs the first imports you tick. It can also load the Northwind demo store instead, to learn on.

IN THIS PART YOU WILL LEARN

- The four steps of the wizard
- The store list and the store card
- The store form: header buttons, smart buttons, Connection and Defaults
- REST or GraphQL, and the API version

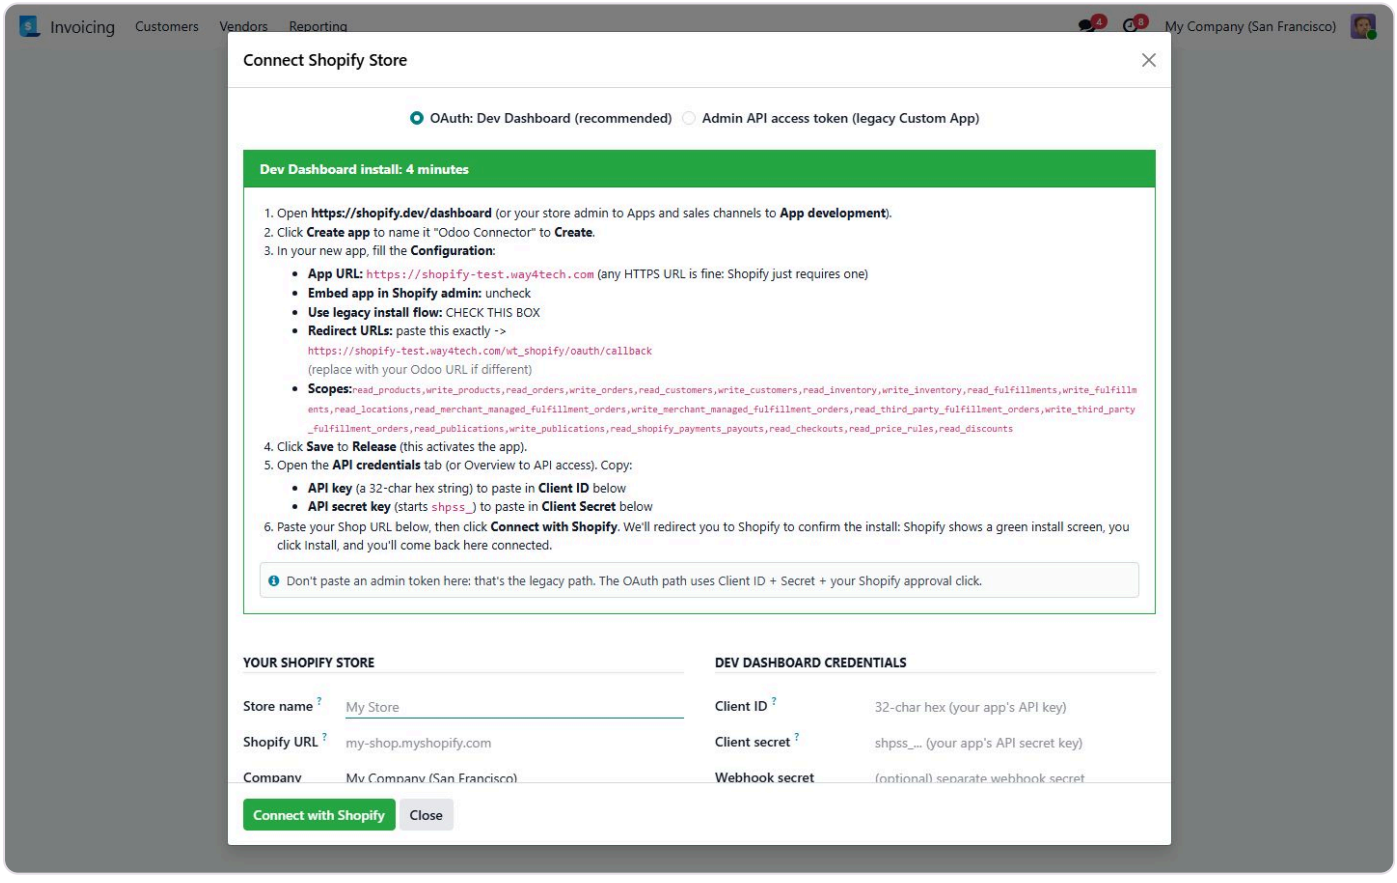

TRY IT YOURSELF

1. Open Shopify, + Connect new store and read the instructions, then close it
2. Open Shopify, Stores, Northwind Outdoor Supply
3. Look at the Connection and Defaults groups

1 Shopify, + Connect new store

The **Connect Shopify Store** wizard opens on the **Credentials** step. Pick **OAuth (Dev Dashboard, recommended)** or **Admin API access token (legacy Custom App)**; the green box lists exactly what to click in Shopify, with Odoo's own URLs to paste. Fill **Store name**, **Shopify URL** (your-shop.myshopify.com), the company, and the credentials, then **Connect with Shopify** (OAuth) or **Test connection** (token).

> The wizard then shows the Test step (shop name, currency, country, email and the message Shopify gave), the Import step and Done. **Load the Northwind demo store instead** creates the demo.

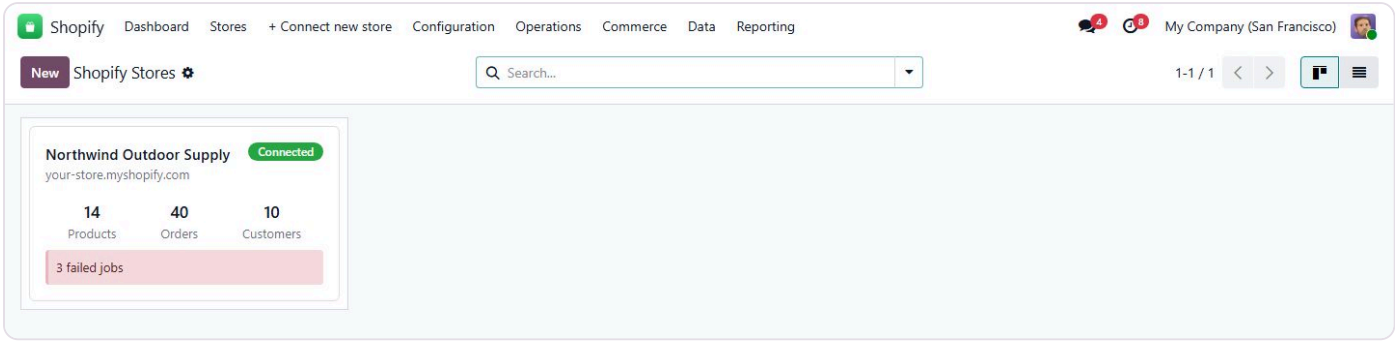

The Import step

Tick what runs when you press **Finish setup**. Foundation (recommended): Import locations and Register webhooks. Catalog and customers: Import products, Import customers. Orders and inventory: Import orders, Pull inventory, Push inventory. Recovery and extras: Import abandoned checkouts. Each becomes a job in the queue; **Open store** takes you to the new store.

2 The store list

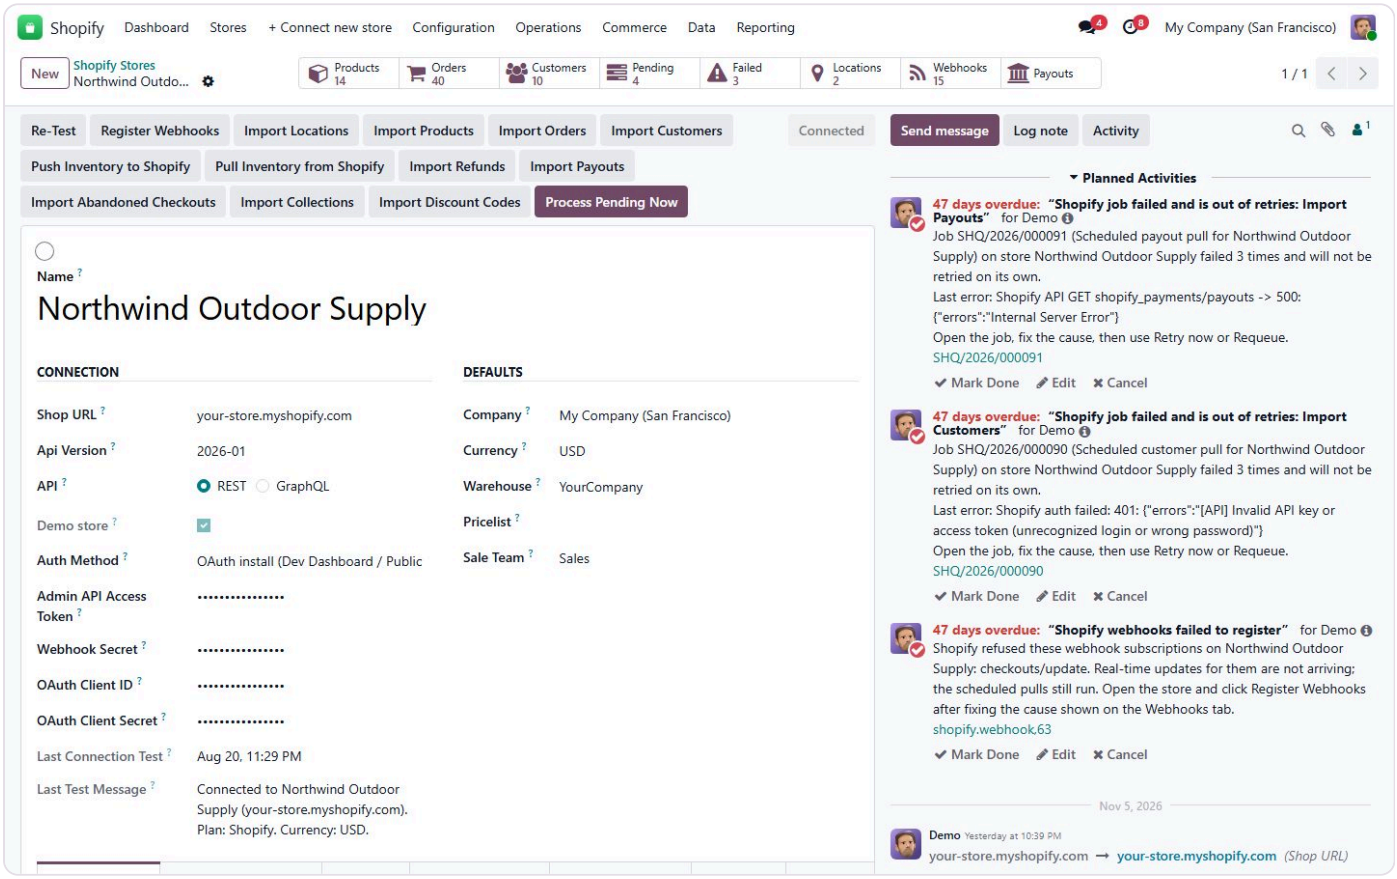

Shopify, Stores shows a card per store: name, address, state (Connected, Error), products, orders and customers, and failed jobs in red. The list view adds pending and failed counts and the last orders sync.

3 The store form

The header holds every manual action (below). Smart buttons count Products, Orders, Customers, Pending and Failed jobs, Locations, Webhooks and Payouts and open them. **Connection** holds the shop URL, the API version, REST or GraphQL, the authentication method, the token and secrets (hidden), the last connection test and its message. **Defaults** holds the company, currency, warehouse, pricelist and sales team.

> The currency should be the one Shopify charges in; orders keep their own currency either way. The warehouse is the fallback for an order whose location is not mapped.

The header buttons

BUTTON	WHAT IT QUEUES OR DOES
Test Connection / Re-Test	Calls Shopify and shows the shop, plan, currency and the API version Shopify answered with
Register Webhooks	Subscribes every enabled topic (part 9)

Import Locations	Reads Shopify locations onto the Locations tab
Import Products / Orders / Customers	Pulls them now
Push Inventory to Shopify / Pull Inventory from Shopify	Sends Odoo stock out, or takes Shopify's figures in
Import Refunds / Payouts / Abandoned Checkouts / Collections / Discount Codes	Pulls them now
Process Pending Now	Runs the waiting jobs at once instead of on the next minute
Complete Setup	Reopens the wizard while the setup progress is under 100 percent
Load the Northwind demo store	Only when no demo store exists
Send digest now	Only when the digest is on (part 18)

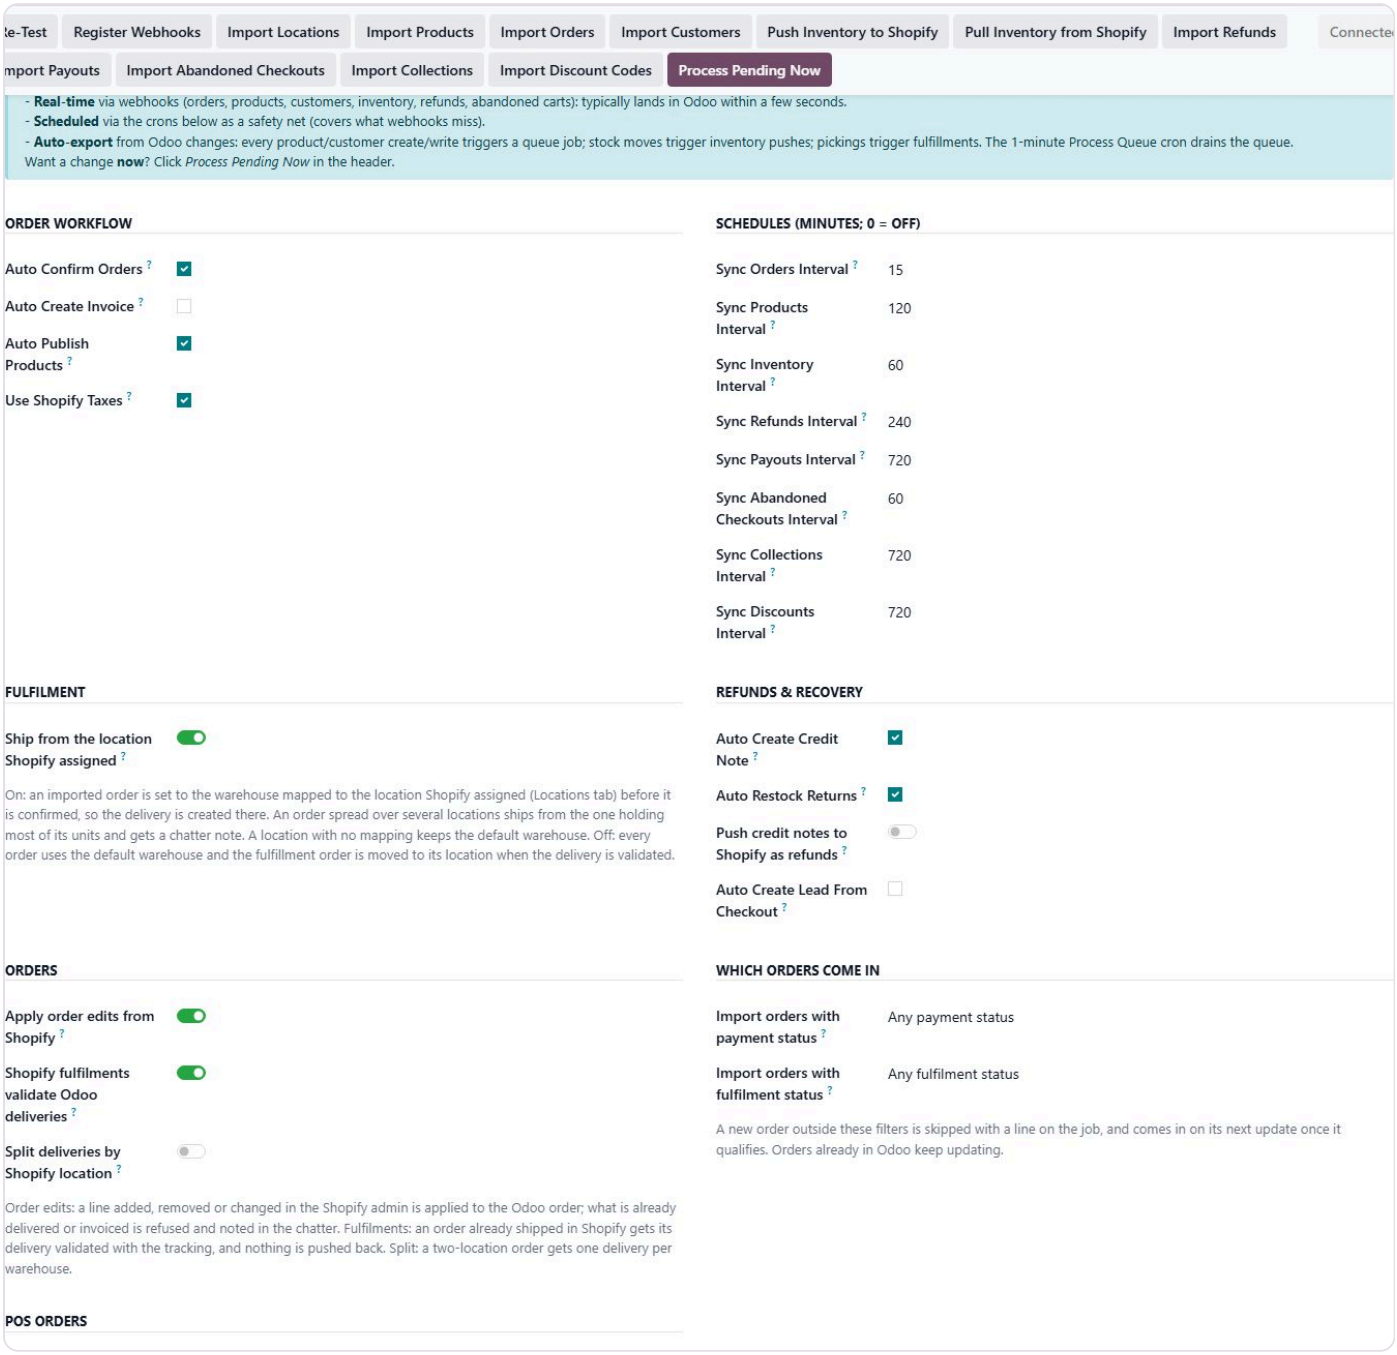

CONNECTION FIELD	MEANING
API version	The Shopify API version the module is pinned to; it warns when Shopify serves another
API: REST or GraphQL	REST is the default and what existing stores run on. GraphQL is the API Shopify develops and handles products with more than 100 variants. Switching changes no data
Demo store	Ticked on a store that answers from the offline demo Shopify

PART 6 Sync behaviour: what runs by itself

The Sync Behaviour tab is the store's control panel: what happens automatically, how often the schedules pull, and the rules for orders, fulfilment, refunds, accounting, the first import, stock and prices, alerts and the digest.

1 Order workflow, schedules, fulfilment and orders

The blue box explains the three paths: real time by webhooks, scheduled pulls as the safety net, and exports triggered by Odoo changes and drained by the one minute queue.

2 POS orders, accounting, first import, stock, pricing, alerts and digest

The rest of the tab, top to bottom.

GROUP	FIELDS	MEANING
Order workflow	Auto confirm orders, Auto create invoice, Auto publish products, Use Shopify taxes	Store wide switches; the workflow rules (part 10) decide per payment status. Use Shopify taxes matches Shopify's tax lines to Odoo taxes by rate
Schedules (minutes, 0 = off)	Orders 15, products 120, inventory 60, refunds 240, payouts 720, abandoned checkouts 60, collections 720, discounts 720	How often each scheduled pull runs for this store
Fulfilment	Ship from the location Shopify assigned	On: the order's warehouse is the one mapped to the location holding most of its units, set before confirming
Refunds and recovery	Auto create credit note, Auto restock returns, Push credit notes to Shopify as refunds, Auto create lead from checkout	Parts 14 and 16
Orders	Apply order edits from Shopify, Shopify fulfilments validate Odoo deliveries, Split deliveries by Shopify location	Parts 12 and 13
Which orders come in	Payment status: any, paid only, paid or partially paid, authorized as well. Fulfilment status: any, not fully fulfilled, fully fulfilled only	A new order outside the filters is skipped with a job line and comes in once it qualifies
POS orders	Import POS orders, POS warehouse, POS orders run the workflow only when paid	Shopify POS sales
Accounting mapping	Payout journal, Sales journal, Fiscal position, Book Shopify fees, Fee account, Fee journal, Reconcile payouts automatically	Parts 10 and 15
First import	First import overwrites Odoo values, Also match customers on phone	Part 11
Inventory: stock export policy	Quantity source, Export percentage, Export offset, Minimum to export	Defaults for every location (part 7)
Pricing	Compare-at pricelist, Import prices into, Export as draft	Part 8
Last sync timestamps	Orders, products, inventory, refunds, payouts, checkouts, collections, discounts	Read only
Alerts	Alert user, Alert email, Alert on failed job, Webhook stale hours	Part 18

Digest	Digest on, recipients, extra email, hour, log retention days	Part 18

PART 7

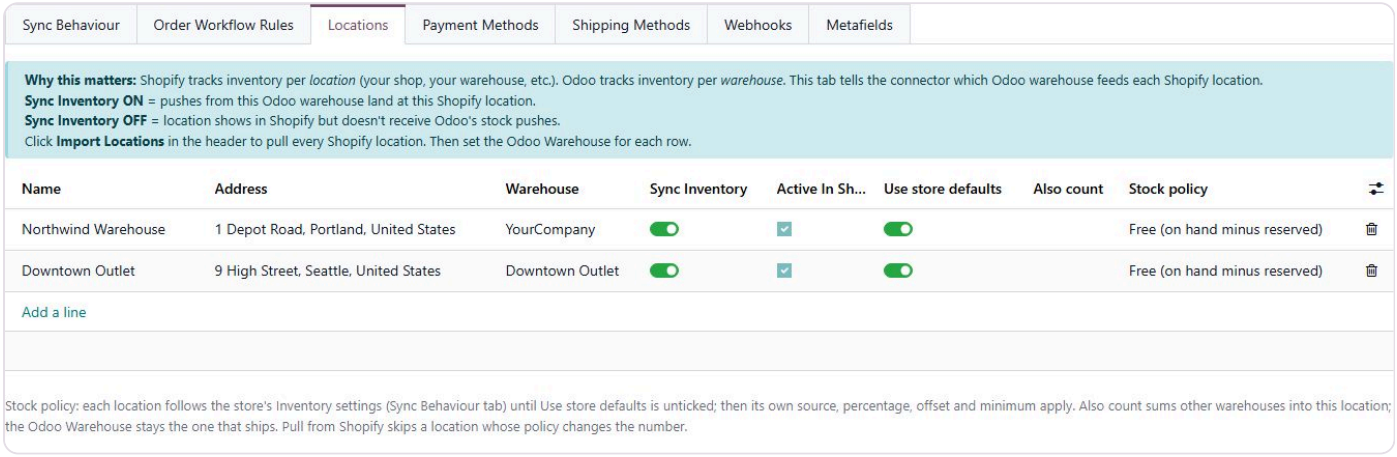

Locations, warehouses and the stock Shopify shows

Each Shopify location is mapped to an Odoo warehouse. The mapping decides whose stock is pushed where, and which warehouse ships an order Shopify assigned to that location.

1 The Locations tab

Press **Import Locations**, then map each row to a **Warehouse**. **Sync inventory** turns stock pushes on for the location; **Active in Shopify** is read from Shopify. **Use store defaults** keeps the store's stock policy; untick it and the location's own columns apply. **Also count** adds other warehouses' stock; **Stock policy** sums up what is pushed.

> An unmapped location is skipped for stock and falls back to the default warehouse for orders. The watchdog raises a connected store with no location at all.

The number pushed to Shopify

SETTING	EFFECT
Quantity source	Free (on hand minus reserved, the default), On hand, or Forecast (plus incoming, minus outgoing)
Export percentage	The share pushed, rounded down. 50 keeps half back for other channels
Export offset	Taken off after the percentage, never below zero: a safety stock the shop never sees
Minimum to export	Below it zero is pushed, so the shop shows sold out rather than the last two units
Also count	Other warehouses summed with the shipping warehouse for this location
Include child companies	Also counts the branches' warehouses, for a group sharing one store

Stock moves in Odoo queue the affected variants; a number Shopify already has is not sent again until the inventory interval passes, a changed number goes out at once. With Manufacturing, a kit pushes the number of kits its components allow, through the same policy. **Pull Inventory from Shopify** skips a location whose policy changes the number, since that figure is not the warehouse's own.

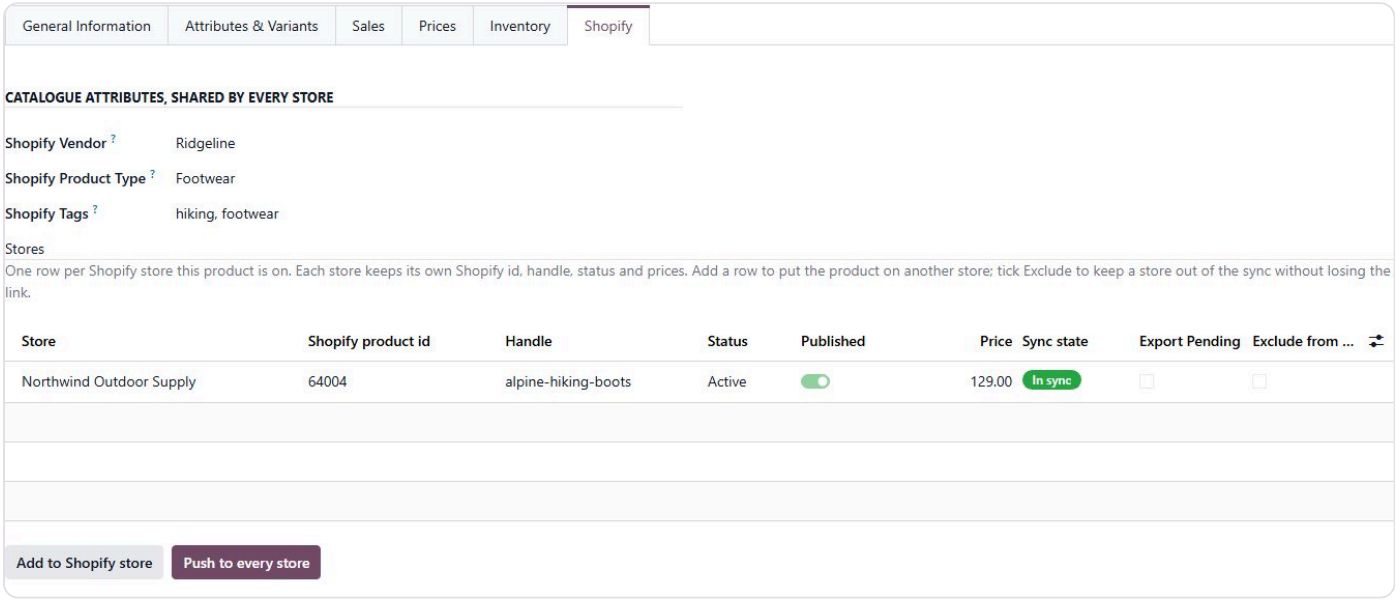

PART 8 Products, prices and publishing

A product is linked to a store through a mapping row, the way a product is linked to its vendors: one row per store. The catalogue (name, description, tags, vendor, type, images, variants) is shared; each row keeps what belongs to that store.

1 The product's Shopify tab

On any product, the **Shopify** tab shows the shared catalogue attributes (vendor, product type, tags) and a **Stores** list: the store, its Shopify product id, handle, status, published, price, sync state, export pending and **Exclude from sync**. **Add to Shopify store** adds a row without exporting; **Push to every store** exports now.

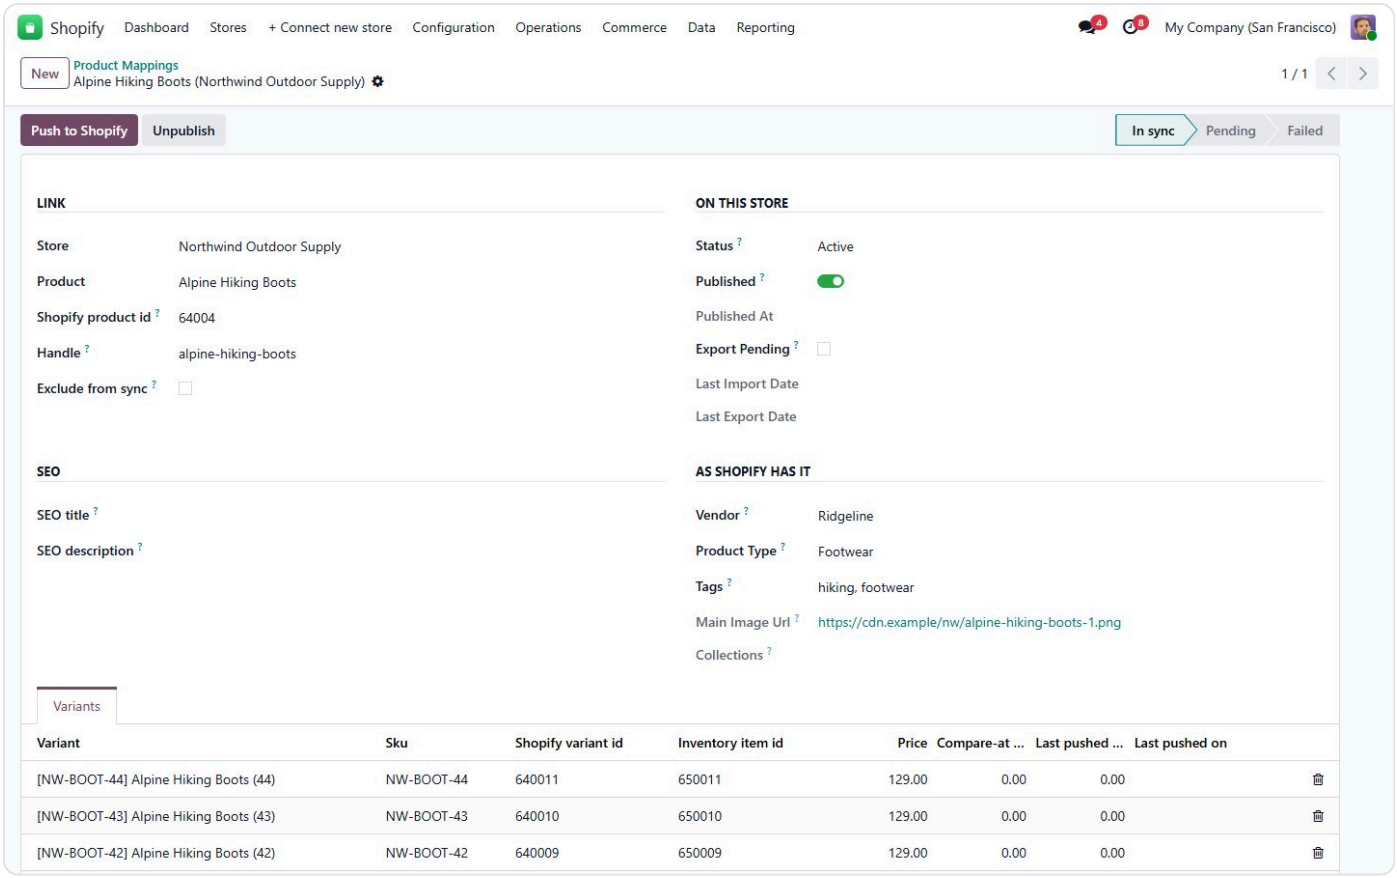

> Exclude from sync keeps one store out: no export, its imports leave the product alone, no stock push. The id is kept for when the box is cleared.

2 A product mapping row

Under **Shopify, Data, Product Mappings**, a row shows the link (store, product, Shopify id, handle, exclude), **On this store** (status active, draft or archived, published, export pending, last import and export dates), **SEO** title and description, what Shopify has (vendor, type, tags, main image, collections) and the variants with their Shopify ids, inventory item ids, price and compare-at price and the quantity last pushed. **Push to Shopify** and **Publish** / **Unpublish** act on the row.

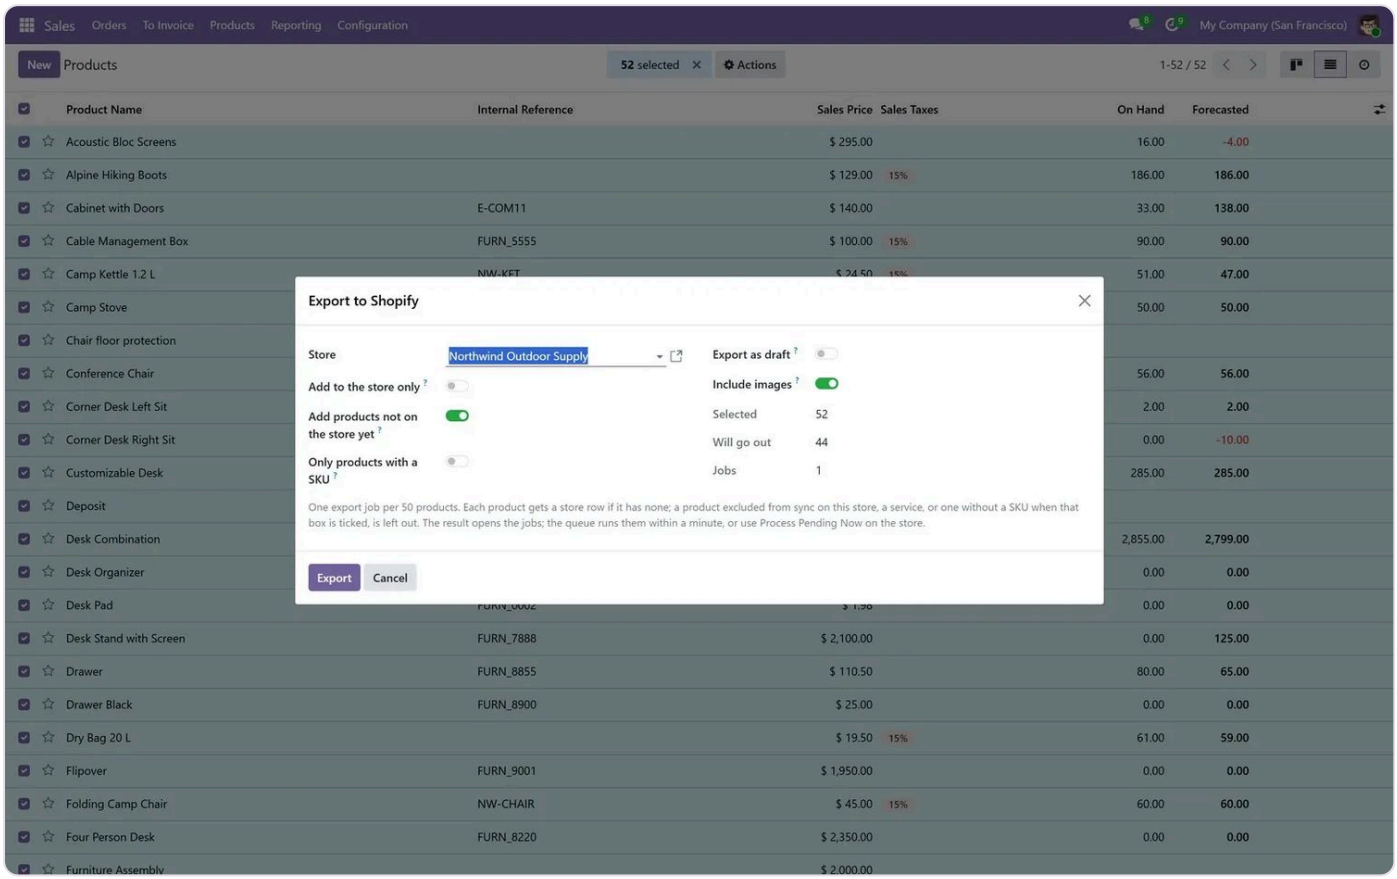

> Publish and Unpublish are also in the Action menu of the Product Mappings list, for many at once.

3 Export many products at once

In **Sales, Products**, select products and choose **Action, Export to Shopify**. Pick the store and the options: add products not on the store yet, export as draft, include images, only products with a SKU. The dialog counts what will go out and how many jobs (one per fifty products) are queued.

> Services, products excluded on that store and products without a SKU when that box is ticked are left out; if nothing qualifies, the export is refused rather than reported green.

Prices per store

FIELD	SET	EMPTY
Pricelist (Defaults)	Every variant goes out at this pricelist's price for one unit	Odoo's sales price
Compare-at pricelist	The struck through price comes from it	From the row's compare-at price; nothing when neither is above zero
Import prices into	A price received from Shopify becomes a fixed price rule in this pricelist; Odoo's sales price is left alone	Odoo's sales price is written only when the store has no export pricelist and the product is on this store only

A pricelist in another currency is converted at the company rate of the day, and the job says so. **Export as draft** creates every new Shopify product as an unpublished draft so it can be checked in Shopify first; Publish on the row makes it live. Over GraphQL, publishing needs the publications scopes; over REST no extra scope is needed. A product deleted in Shopify is archived in Odoo when that was its only store.

The product list has filters **Shopify products**, **Shopify export pending** and **Shopify sync failed**, and a **Retry Shopify sync** button on failed products and variants.

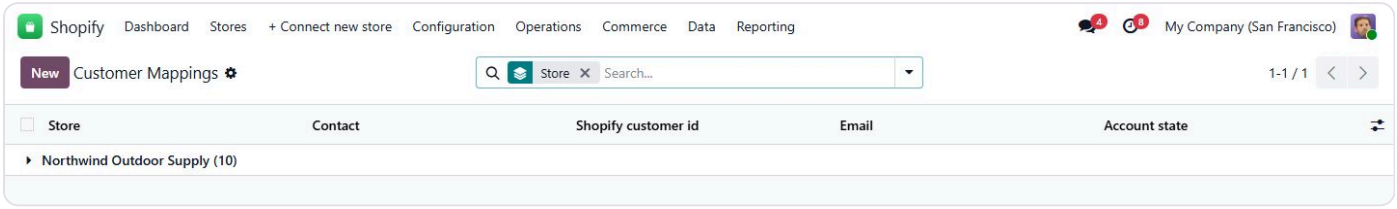

PART 9 Customers, webhooks and metafields

Customers

1 Customer Mappings

Shopify, Data, Customer Mappings holds one row per contact per store: the contact, the Shopify customer id, email and account state. A contact's form has a **Shopify** tab with the same rows, and the contact list a Shopify customers filter.

> Customers are matched on email, case insensitive, and optionally on phone (digits only, seven or more). A plain contact is preferred over a company or an address with the same email.

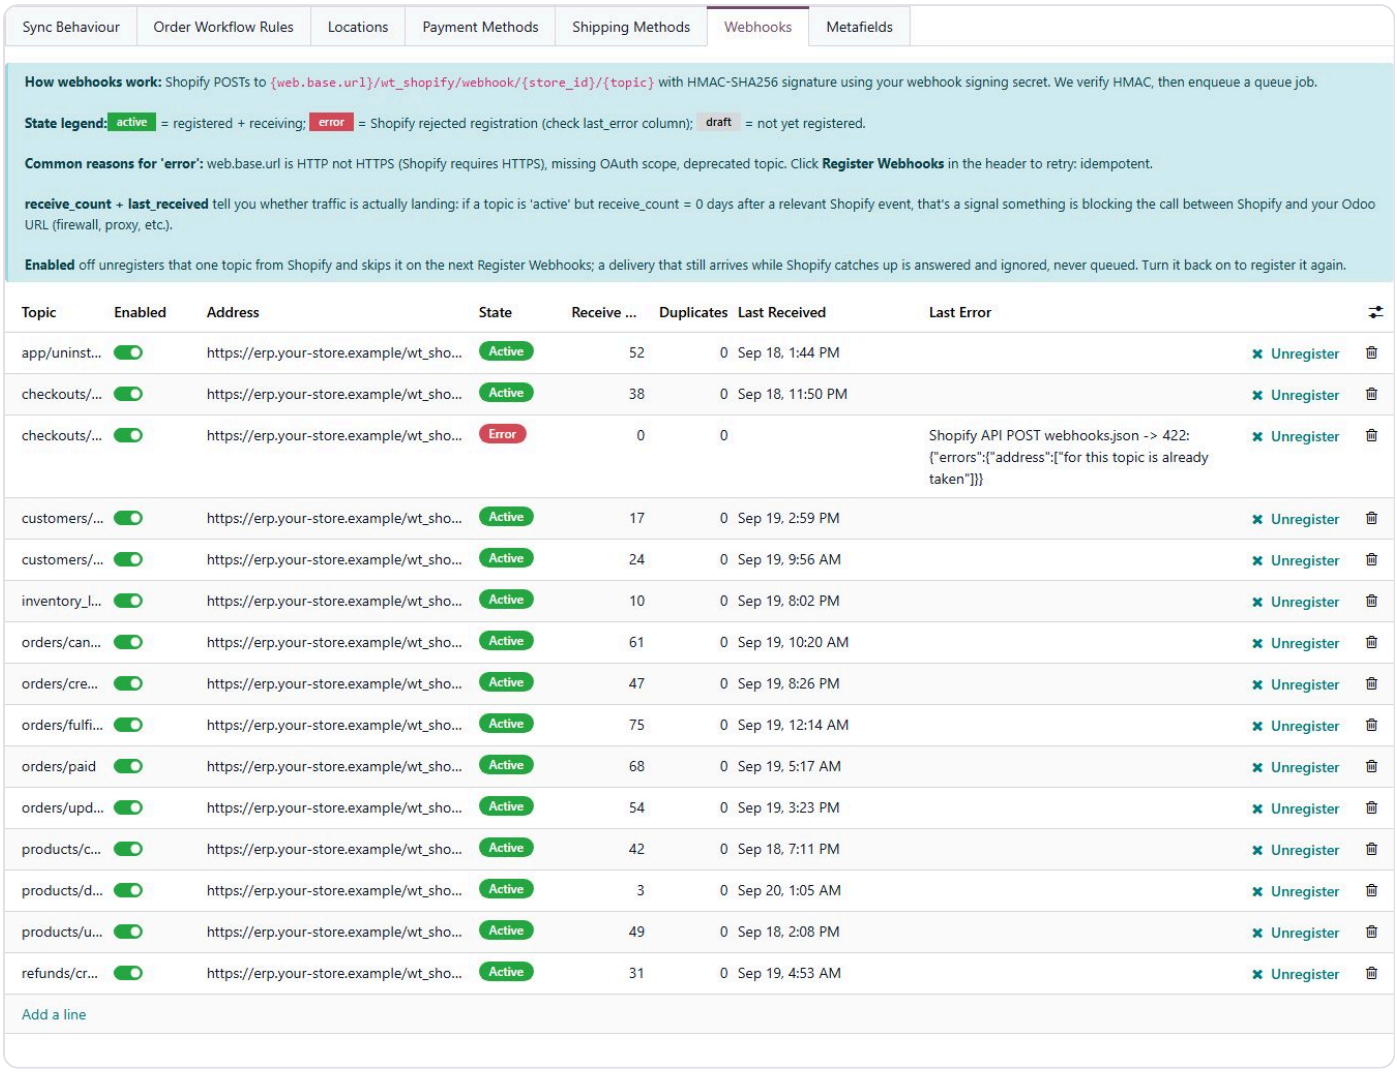

Webhooks

2 The Webhooks tab

After **Register Webhooks**, each topic has a row: enabled, the address Shopify calls, its state, how many were received, duplicates, the last received and the last error, with **Unregister**. Topics: orders (create, updated, cancelled, paid, fulfilled), products (create, update, delete), inventory levels, customers, refunds, checkouts, fulfilments and app/uninstalled.

> Every webhook is checked against the signing secret; a bad signature is refused with 401 and logged. A replay with the same webhook id is answered and counted as a duplicate, never imported twice. Turning a row off unregisters it and Register Webhooks skips it until it is on again.

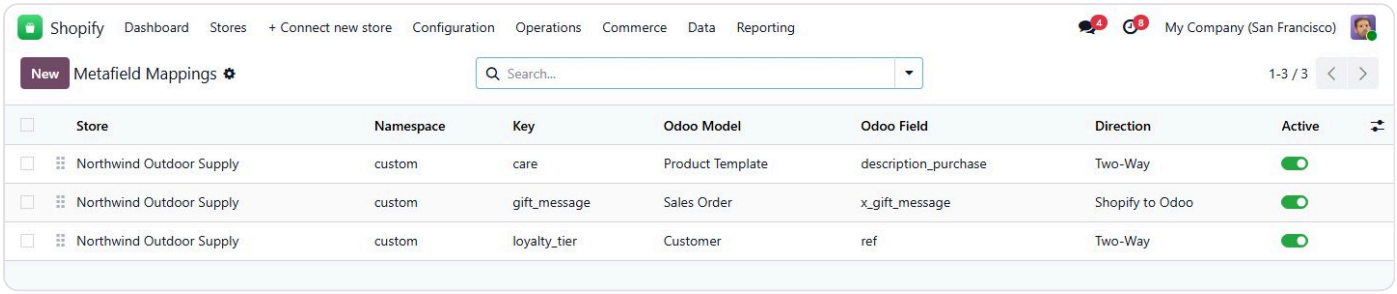

Metafields

3 Metafield Mappings

Shopify, Configuration, Metafield Mappings (also the store's Metafields tab): a store, a namespace and key, a value type, the Odoo model (product template, product variant, order, customer), the Odoo field and the direction. On import the metafield is written to the field; on export of a product or customer the field is written back. Order metafields are import only.

> Shopify's SEO title and description are handled by the product row, not by mappings.

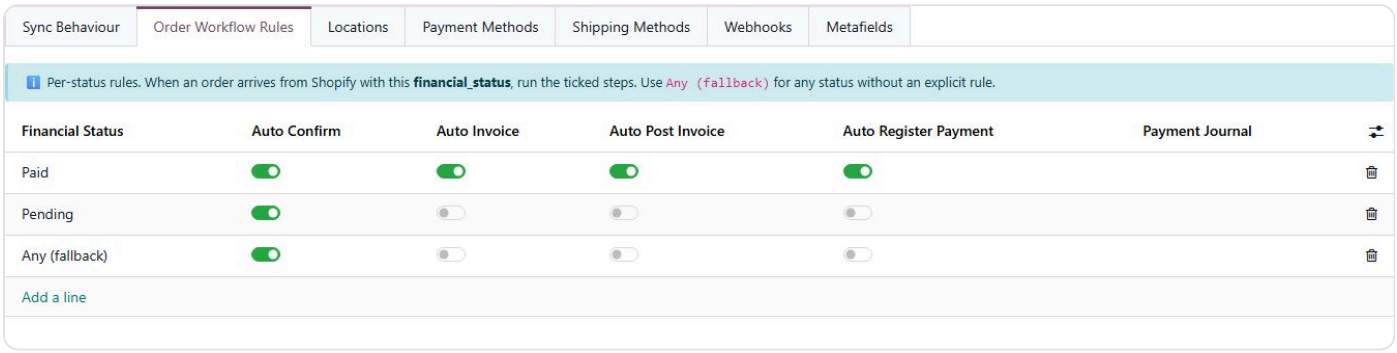

PART 10 Accounting, payments, shipping and workflow rules

Before the first order arrives, tell Odoo what to do with it: which journal, which taxes, which payment journal per gateway, which delivery product per shipping method, and how far to take each order automatically.

1 Order Workflow Rules

One rule per Shopify financial status: paid, pending, authorized, partially paid, refunded, voided, or `*` for any other. Each has **Auto Confirm**, **Auto Invoice**, **Auto Post Invoice**, **Auto Register Payment**, a payment journal and **Validate delivery**.

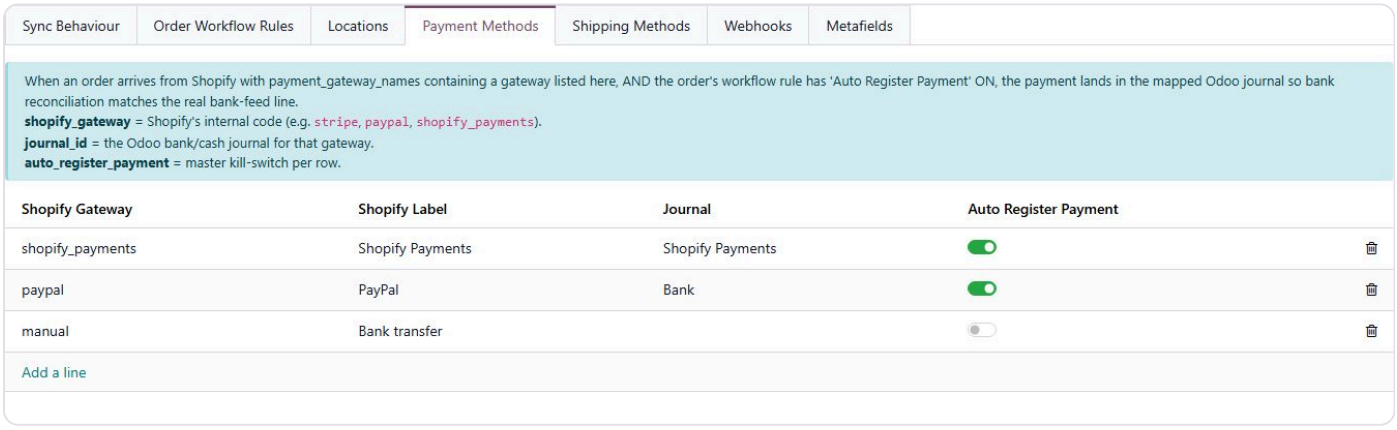

> A sensible start: paid confirms, invoices, posts and registers the payment; pending, authorized and the fallback confirm only. Payments are registered for what Shopify captured, never the authorised amount. Validate delivery is for digital goods or full drop shipping only.

2 Payment Methods

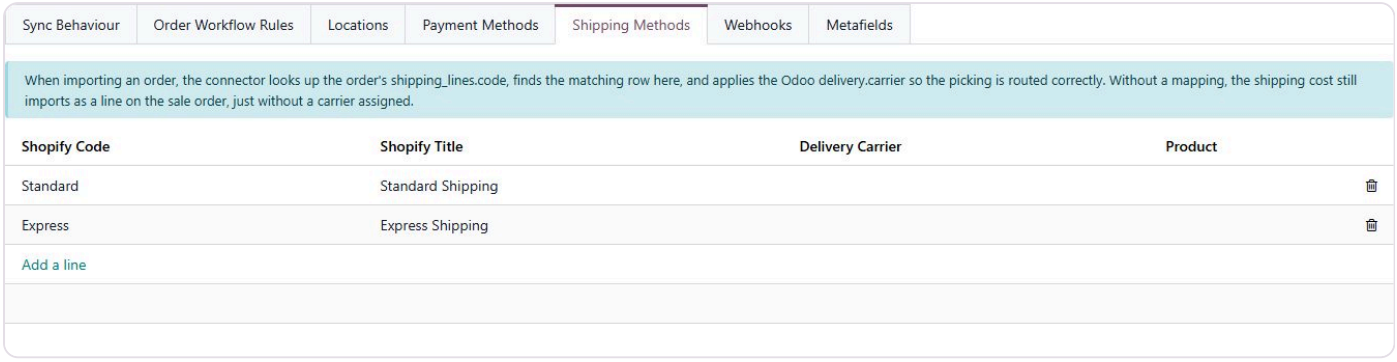

One row per Shopify gateway (shopify_payments, paypal, manual) with its label, the Odoo journal that receives its payments and whether payments are registered automatically.

> A gateway with no row falls back to the workflow rule's journal, then the company's bank journal.

3 Shipping Methods

Shopify shipping codes and titles mapped to a delivery carrier and a delivery product, so the shipping line on an order is a real product.

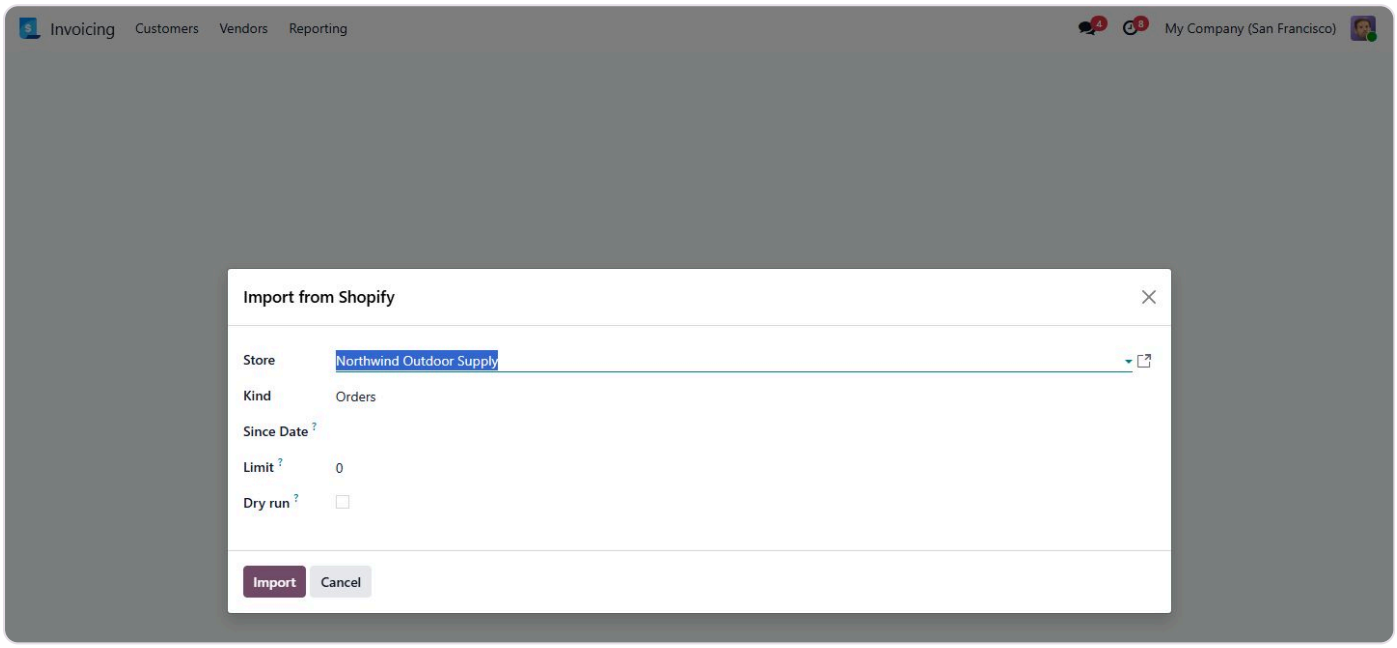

Sales journal receives the invoices of Shopify orders, **Payout journal** the payouts as statement lines, and the **Fiscal position** is applied to every imported order. With Use Shopify taxes on, Shopify's tax lines are matched to Odoo taxes by rate, created in a Shopify Tax group when missing; either way the order total is checked against Shopify's and a one cent rounding difference is absorbed on a labelled line.

PART 11 The first import, with a dry run

When a catalogue already exists in Odoo, the order matters: products, then customers, then orders, then one stock push. Run each as a dry run first.

1 Shopify, Operations, Import from Shopify

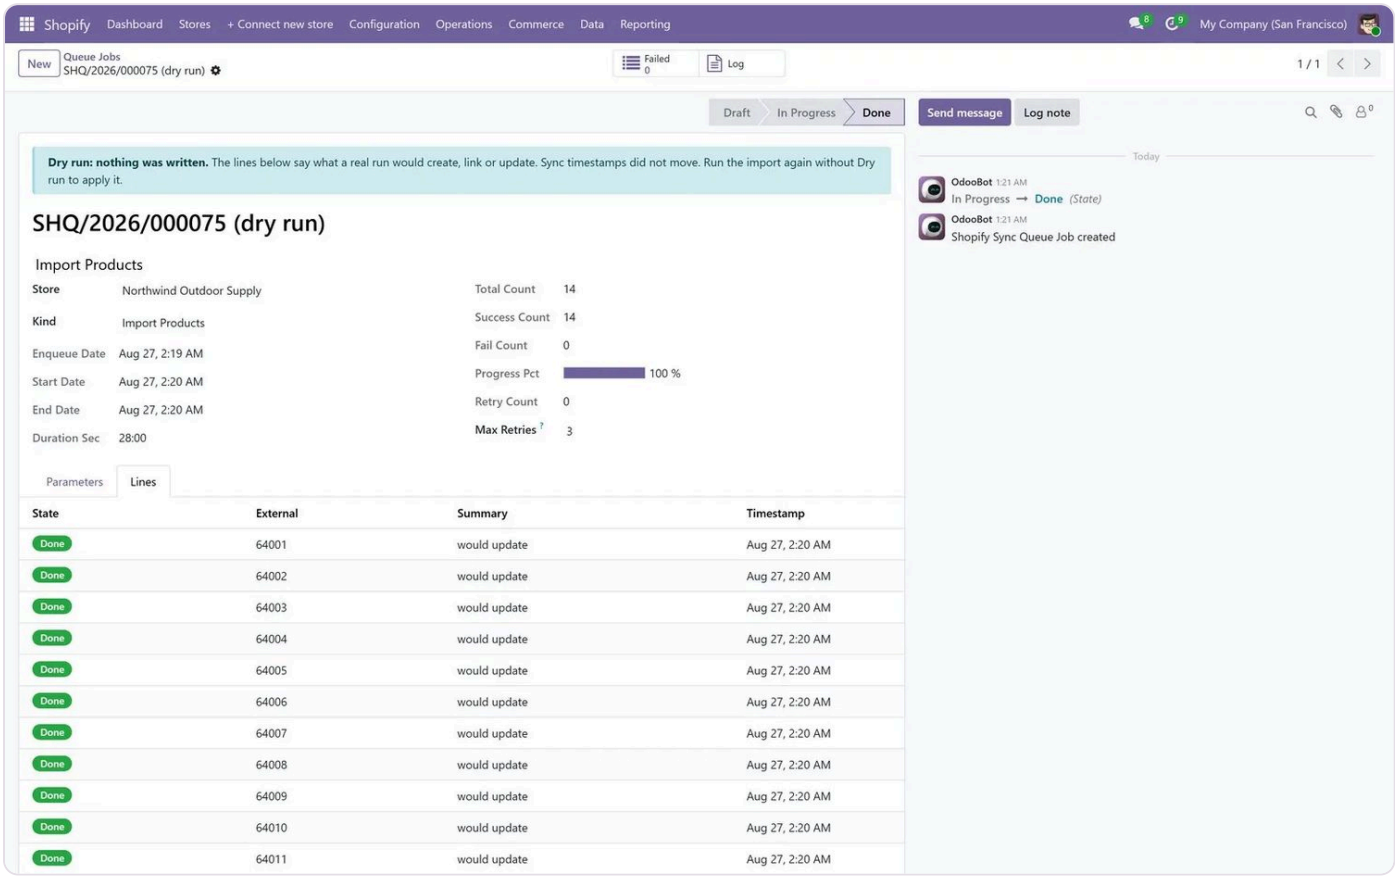

Choose the **Store**, the **Kind** (Products, Orders, Customers), an optional **Since date** and **Limit** (0 for all), and tick **Dry run**. The button then reads **Run dry**; without it, **Import**.

2 Read the dry run

The job is named with (dry run) and shows a banner: nothing was written. Each line says what a real run would do: would link to a product (SKU), would create, would update, or a failed line when the SKUs of one Shopify product sit on two Odoo products.

> A dry run downloads no images and moves no sync timestamp. Fix what it shows, then run it for real.

STEP	HOW IT MATCHES	NOTES
1. Products	The SKUs (Internal Reference) or barcodes of the variants	A match is linked, not copied; Odoo keeps its values and only empty fields are filled, unless First import overwrites Odoo values is on
2. Customers	Email, then optionally phone	Several contacts with one email: the oldest is linked and the job notes it
3. Orders	The Shopify order id	A retry updates rather than duplicates; the Which orders come in filters apply
4. Push inventory		So Shopify shows what Odoo can sell

PART 12 Orders from Shopify

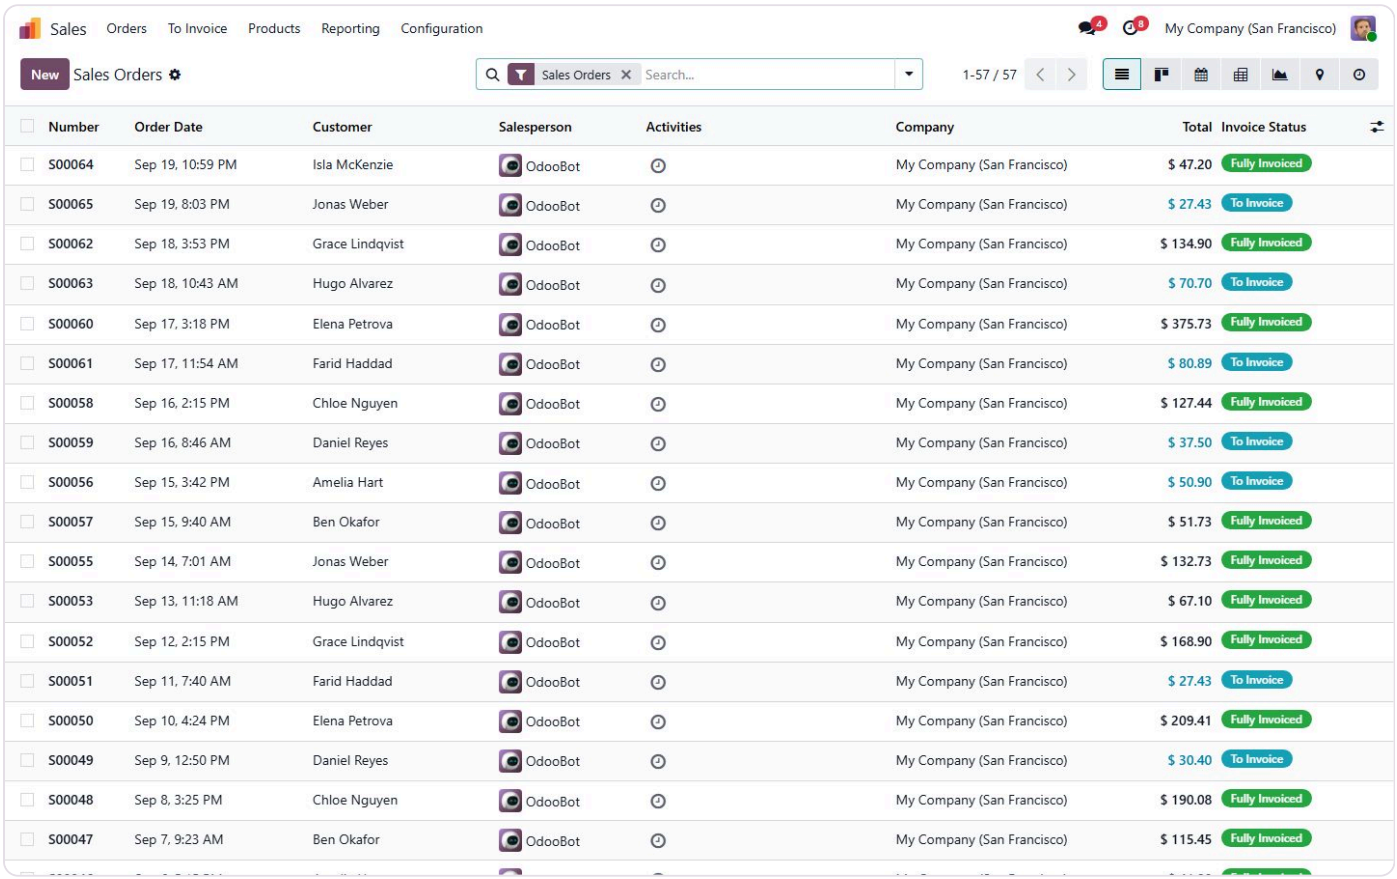

An order placed on Shopify reaches Odoo by webhook within seconds, with its lines, shipping, taxes, discounts, currency, addresses, risk and fulfillment orders, and the workflow rule for its payment status is applied.

TRY IT YOURSELF

1. Open Sales, Orders and filter Shopify orders
2. Open S00064 and its Shopify tab
3. Compare S00065, paid in part and not invoiced

1 Shopify orders in Sales

Imported orders are ordinary sales orders. The list has a **Shopify orders** filter (and a POS orders filter); the invoice status shows how far the workflow rule took each one.

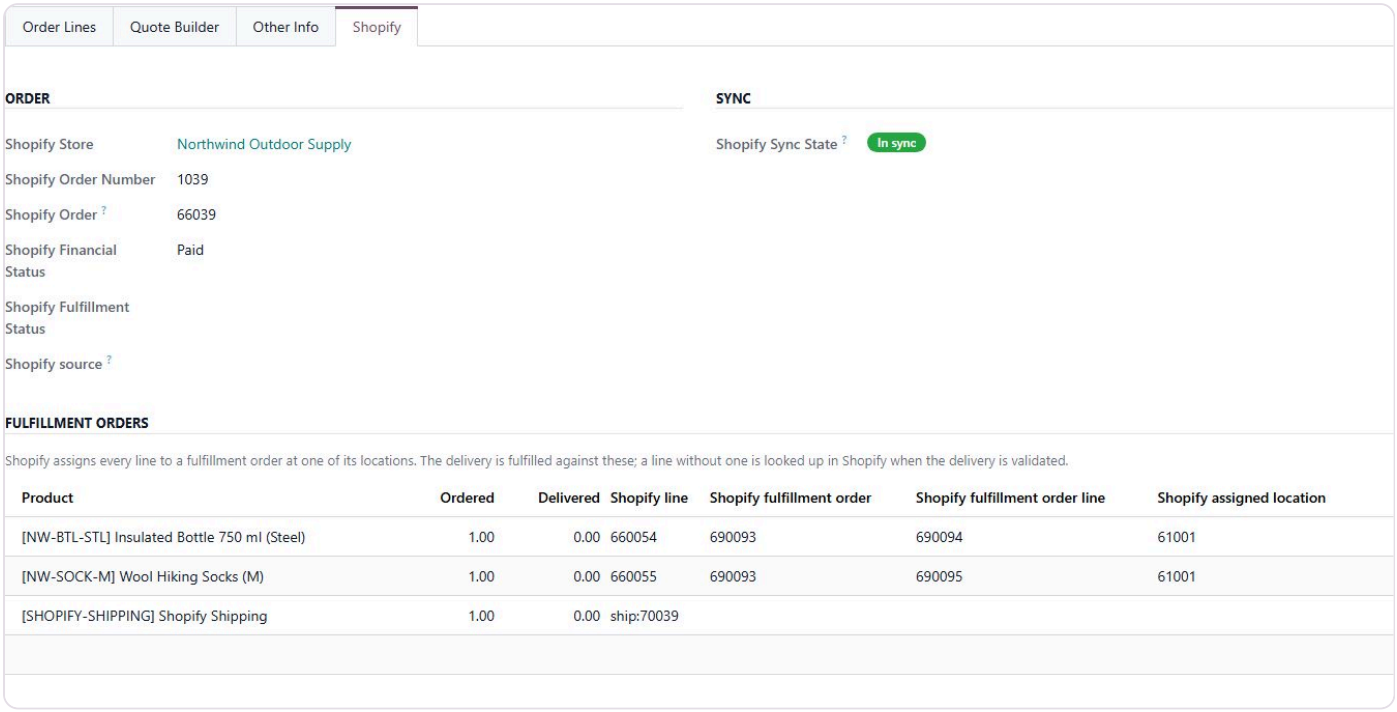

Number	Order Date	Customer	Salesperson	Activities	Company	Total	Invoice Status
S00064	Sep 19, 10:59 PM	Isla McKenzie	OdooBot		My Company (San Francisco)	$ 47.20	Fully Invoiced
S00065	Sep 19, 8:03 PM	Jonas Weber	OdooBot		My Company (San Francisco)	$ 27.43	To Invoice
S00062	Sep 18, 3:53 PM	Grace Lindqvist	OdooBot		My Company (San Francisco)	$ 134.90	Fully Invoiced
S00063	Sep 18, 10:43 AM	Hugo Alvarez	OdooBot		My Company (San Francisco)	$ 70.70	To Invoice
S00060	Sep 17, 3:18 PM	Elena Petrova	OdooBot		My Company (San Francisco)	$ 375.73	Fully Invoiced
S00061	Sep 17, 11:54 AM	Farid Haddad	OdooBot		My Company (San Francisco)	$ 80.89	To Invoice
S00058	Sep 16, 2:15 PM	Chloe Nguyen	OdooBot		My Company (San Francisco)	$ 127.44	Fully Invoiced
S00059	Sep 16, 8:46 AM	Daniel Reyes	OdooBot		My Company (San Francisco)	$ 37.50	To Invoice
S00056	Sep 15, 3:42 PM	Amelia Hart	OdooBot		My Company (San Francisco)	$ 50.90	To Invoice
S00057	Sep 15, 9:40 AM	Ben Okafor	OdooBot		My Company (San Francisco)	$ 51.73	Fully Invoiced
S00055	Sep 14, 7:01 AM	Jonas Weber	OdooBot		My Company (San Francisco)	$ 132.73	Fully Invoiced
S00053	Sep 13, 11:18 AM	Hugo Alvarez	OdooBot		My Company (San Francisco)	$ 67.10	Fully Invoiced
S00052	Sep 12, 2:15 PM	Grace Lindqvist	OdooBot		My Company (San Francisco)	$ 168.90	Fully Invoiced
S00051	Sep 11, 7:40 AM	Farid Haddad	OdooBot		My Company (San Francisco)	$ 27.43	To Invoice
S00050	Sep 10, 4:24 PM	Elena Petrova	OdooBot		My Company (San Francisco)	$ 209.41	Fully Invoiced
S00049	Sep 9, 12:50 PM	Daniel Reyes	OdooBot		My Company (San Francisco)	$ 30.40	To Invoice
S00048	Sep 8, 3:25 PM	Chloe Nguyen	OdooBot		My Company (San Francisco)	$ 190.08	Fully Invoiced
S00047	Sep 7, 9:23 AM	Ben Okafor	OdooBot		My Company (San Francisco)	$ 115.45	Fully Invoiced

2 The order's Shopify tab

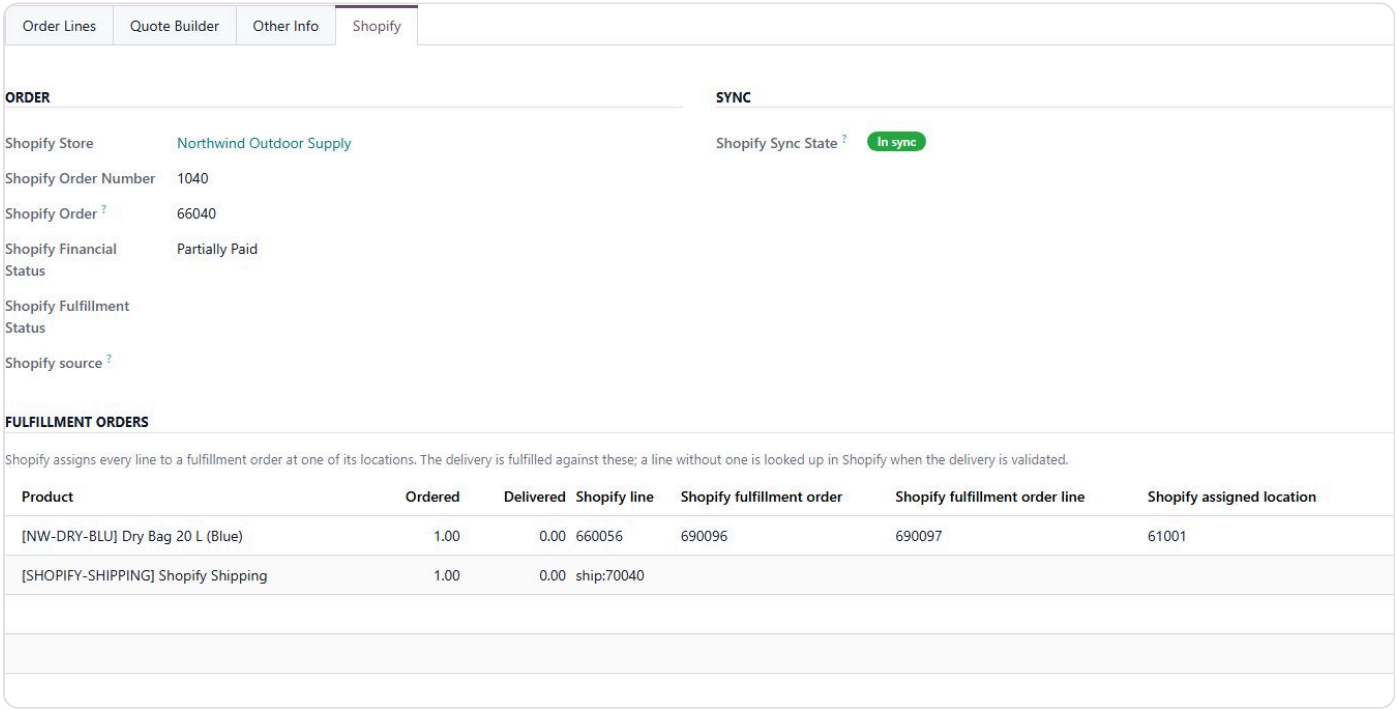

Order: the store, the Shopify order number and id, the financial and fulfilment status and the source (web or POS). **Sync**: the sync state. **Fulfillment orders**: per line, what was ordered and delivered, the Shopify line, the fulfillment order and its line, and the location Shopify assigned.

> On a multi currency shop the tab also shows the presentment currency and total, what the customer paid in their own currency.

3 A partially paid order

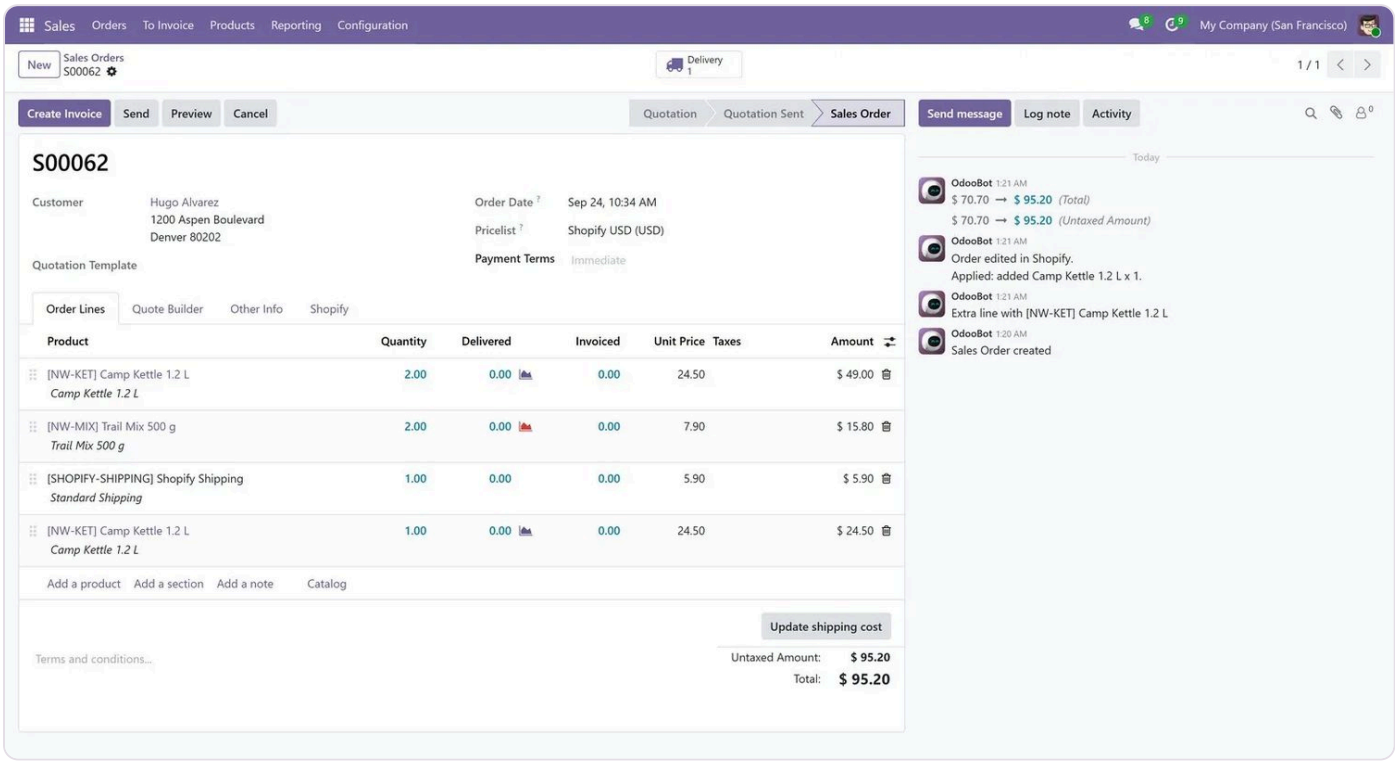

S00065 is partially paid, so its rule confirmed it but did not invoice it. When the paid webhook arrives, the paid rule runs.

4 An order edited in Shopify

With **Apply order edits from Shopify** on, a line added, removed or changed in the Shopify admin changes the Odoo order, and the chatter gets one note, Order edited in Shopify, listing what was applied and what was refused.

> Delivered or invoiced quantities are never lowered, and a price is not changed after invoicing; the refund import brings the money back as a credit note instead.

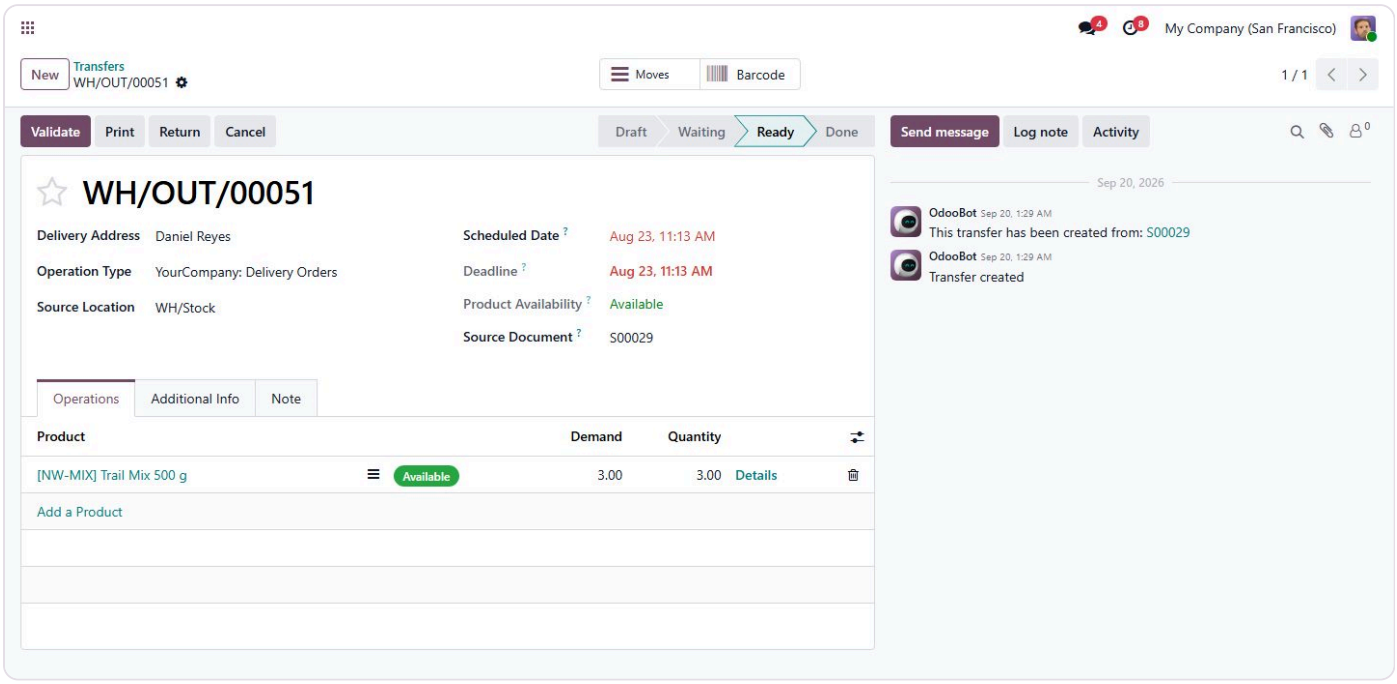

EVENT	WHAT HAPPENS IN ODOO
Order paid, updated or cancelled on Shopify	The Odoo order follows; a cancel cancels it once
Order cancelled in Odoo	Cancelled on Shopify, once
Order on Shopify POS	Imported as a POS order, shipped from the till's warehouse (location mapping, then the POS warehouse, then the default); paid POS orders run the workflow at once
Order total differs from Shopify	Flagged on the job, never hidden
Push to Shopify / Retry Shopify sync	Buttons on the order for a manual push or a retry after a failure

PART 13 Deliveries, fulfilment and tracking

Shopify assigns every order to a location. Odoo ships it from the mapped warehouse, and the validated delivery becomes the Shopify fulfilment with its tracking.

1 A delivery waiting to ship

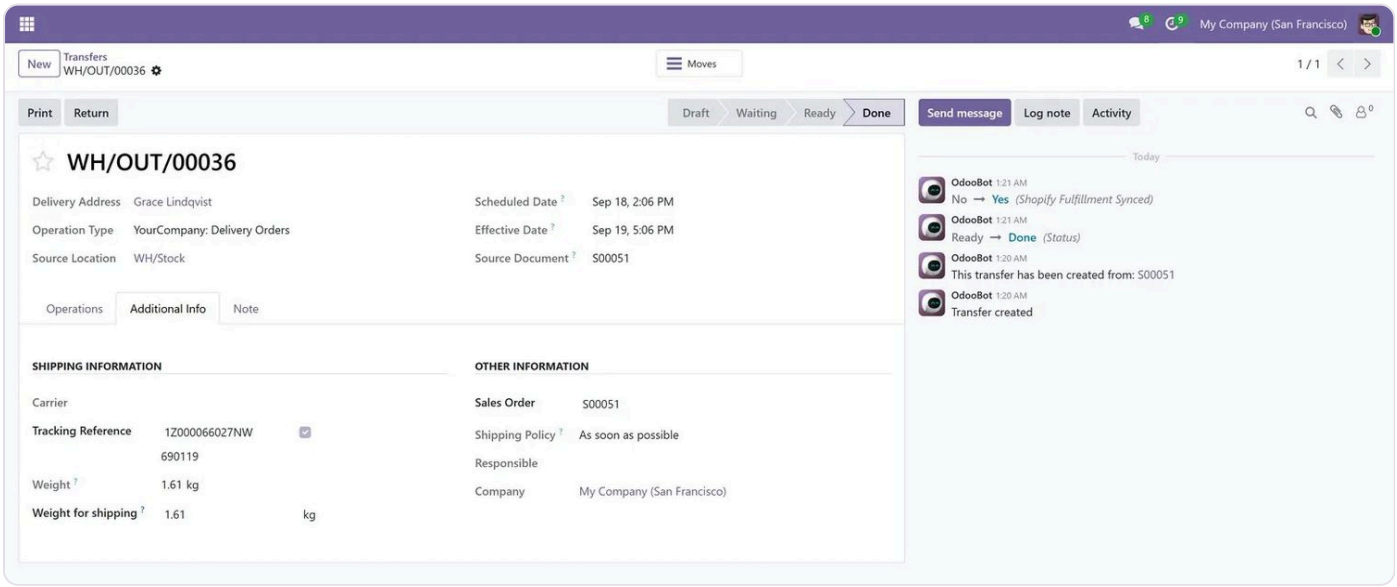

The delivery of a Shopify order is a normal Odoo delivery. Validate it as usual: the connector reads the order's fulfillment orders again from Shopify, then fulfils exactly the shipped quantities. A partial delivery makes a partial fulfilment.

2 Tracking goes with the fulfilment

The carrier and tracking reference on the delivery are sent with the fulfilment, and a later change is sent too. **Push fulfilment to Shopify** on the delivery sends it by hand.

> If the delivery ships from a warehouse mapped to another location than the one Shopify assigned, the fulfillment order is moved there first.

STORE OPTION	ON	OFF

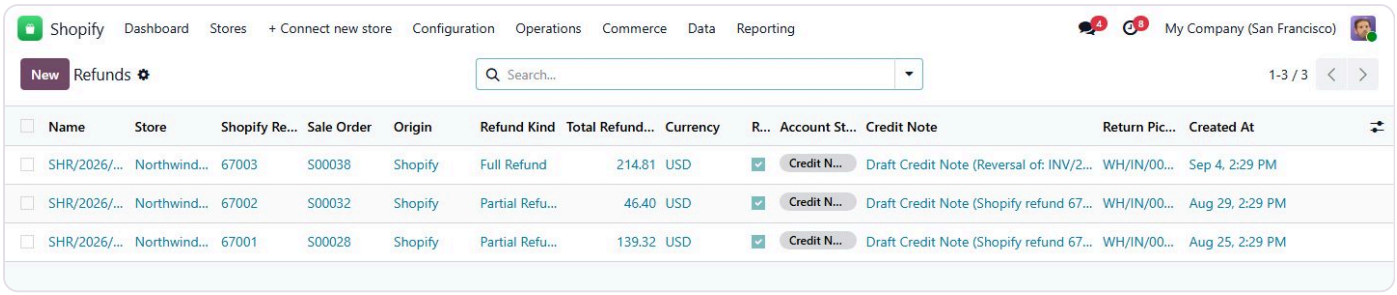

Ship from the location Shopify assigned (default on)	The order's warehouse is the one of the location holding most units; an order over two locations gets a chatter note	Every order uses the default warehouse
Split deliveries by Shopify location (default off)	One delivery per warehouse, each fulfilled against its own fulfillment order (one step deliveries only)	One delivery per order
Shopify fulfilments validate Odoo deliveries	An order already fulfilled in Shopify (history, POS, a 3PL) validates its Odoo delivery with Shopify's tracking, and nothing is pushed back	Every delivery waits for the warehouse

A fulfilment Shopify refuses (an order on hold, fulfilled by hand already) fails its job with Shopify's reason, is retried, and raises the store's alert when the retries run out. Nothing is posted twice.

PART 14 Refunds both ways

1 Shopify, Commerce, Refunds

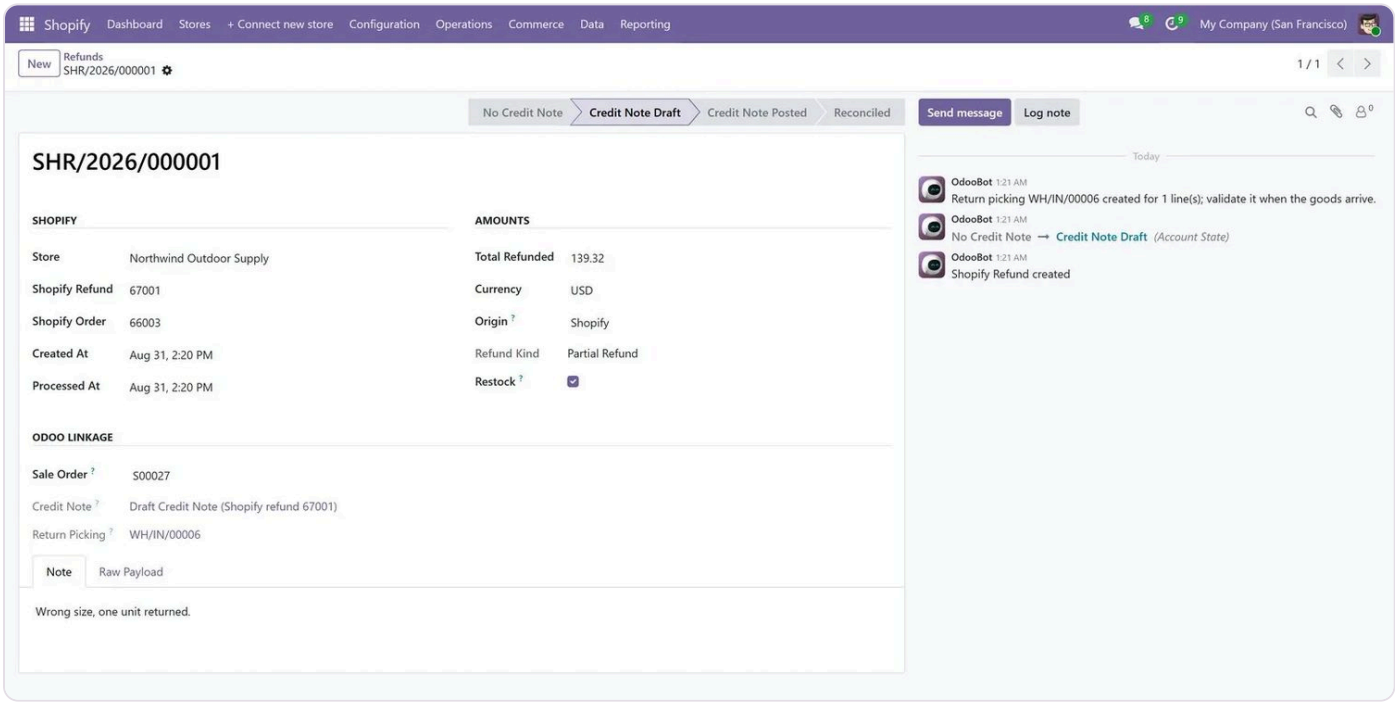

Each Shopify refund is a record: the store, the Shopify refund and order, the sale order, the origin (Shopify or Odoo), the kind (full, partial), the amount and currency, the credit note and the return picking.

Name	Store	Shopify Re...	Sale Order	Origin	Refund Kind	Total Refund...	Currency	R...	Account St...	Credit Note	Return Pic...	Created At
SHR/2026/...	Northwind...	67003	S00038	Shopify	Full Refund	214.81	USD	☑	Credit N...	Draft Credit Note (Reversal of: INV/2...	WH/IN/00...	Sep 4, 2:29 PM
SHR/2026/...	Northwind...	67002	S00032	Shopify	Partial Refu...	46.40	USD	☑	Credit N...	Draft Credit Note (Shopify refund 67...	WH/IN/00...	Aug 29, 2:29 PM
SHR/2026/...	Northwind...	67001	S00028	Shopify	Partial Refu...	139.32	USD	☑	Credit N...	Draft Credit Note (Shopify refund 67...	WH/IN/00...	Aug 25, 2:29 PM

2 A refund

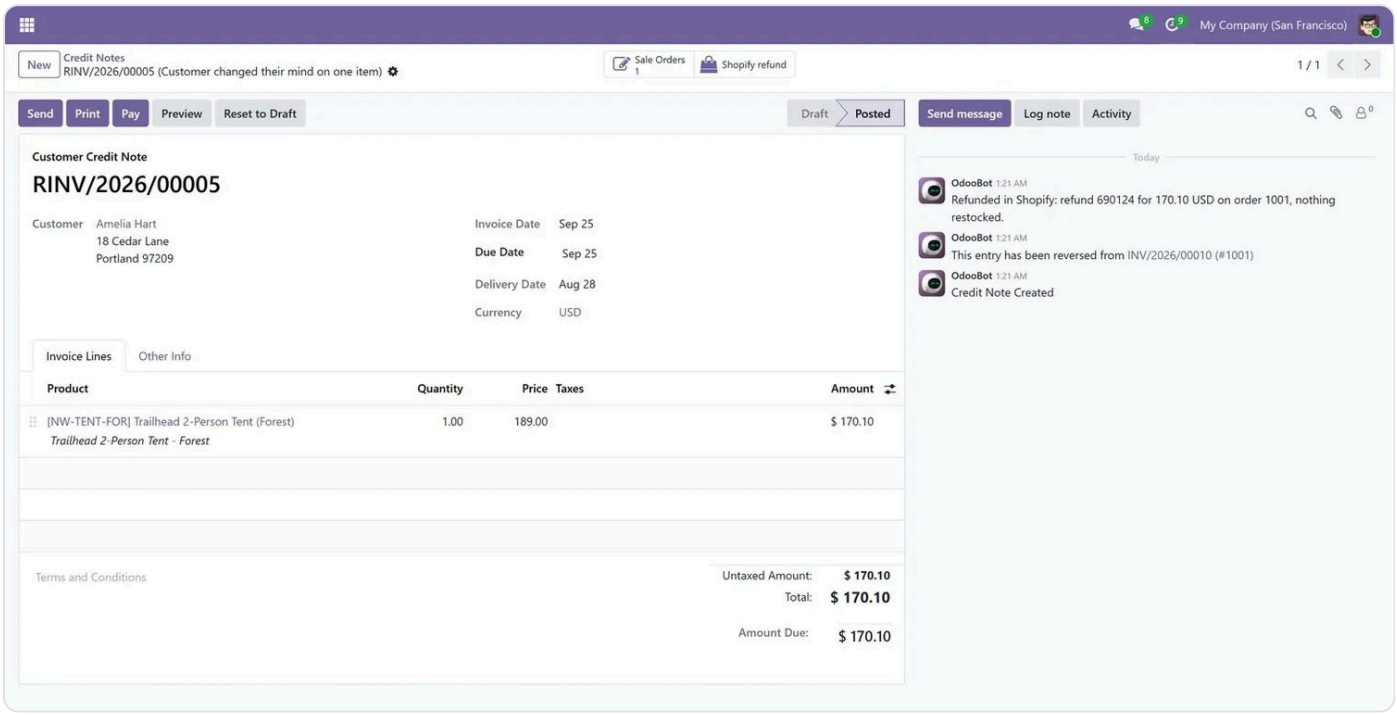

With **Auto create credit note** on, the refund makes a draft credit note for exactly the refunded amount; with **Auto restock returns** on, a return picking holds the units Shopify marked as restocked. Neither is posted or validated for you. **Create credit note** and **Create return picking** do it by hand.

3 A credit note made in Odoo refunds in Shopify

A credit note reversing a Shopify order's invoice can refund the customer in Shopify: automatically on posting when **Push credit notes to Shopify as refunds** is on, or with the **Refund in Shopify** button on the posted credit note.

> Shopify is asked first how much it still holds; a credit note above that, or in another currency, is refused with the figures. One credit note makes one refund, and the echo webhook never makes a second credit note.

PART 15 Payouts, fees and reconciliation

Shopify Payments pays out in batches, net of its fees. The connector imports each payout, the transactions behind it and the fees, and proves which invoices and credit notes make it up.

1 Shopify, Data, Payouts

Each payout with its date, Shopify id, amount, fee amount, matched and unmatched amounts, currency, state (scheduled, in transit, paid) and reconcile state.

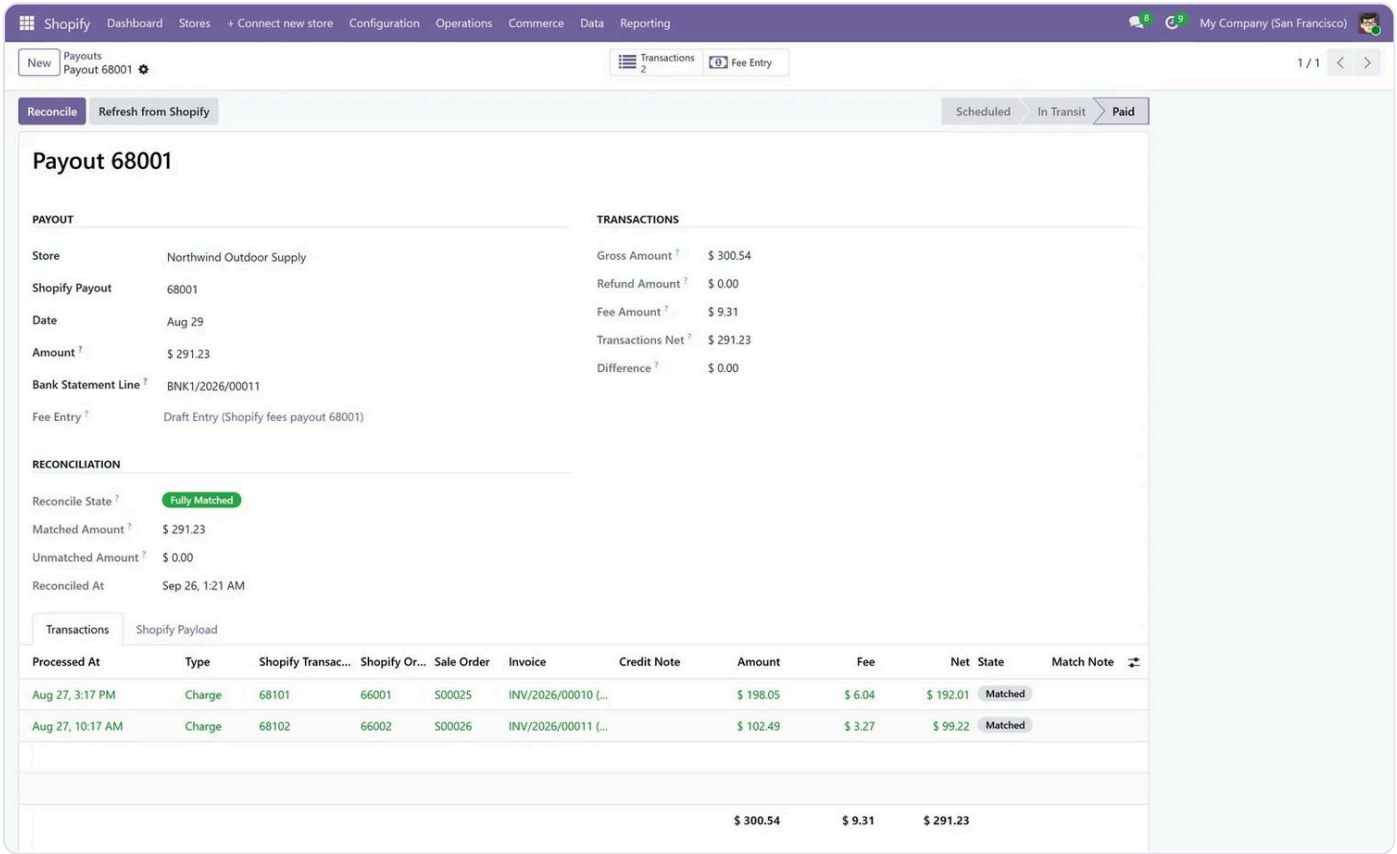

Date	Store	Shopify Payout	Amount	Fee Amount	Matched Amo...	Unmatched A...	Currency	State	Reconcile State
Sep 18	Northwind Outdoor Supply	68004	$ 967.40	$ 0.00	$ 0.00	$ 967.40	USD	In Transit	Not Reconciled
Sep 10	Northwind Outdoor Supply	68003	412.00 €	0.00 €	0.00 €	412.00 €	EUR	Paid	Not Reconciled
Sep 6	Northwind Outdoor Supply	68002	$ 2,213.10	$ 0.00	$ 0.00	$ 2,213.10	USD	Paid	Not Reconciled
Aug 23	Northwind Outdoor Supply	68001	$ 1,840.55	$ 0.00	$ 0.00	$ 1,840.55	USD	Paid	Not Reconciled
			$ 5,342.07	$ 0.00					

2 A reconciled payout

The form shows the payout, its bank statement line on the payout journal and the fee entry; **Transactions** (gross, refund and fee amounts, net, and the difference from the payout); **Reconciliation** (state, matched and unmatched amount). The Transactions tab lists each charge, refund or adjustment with its order, invoice or credit note, amount, fee, net and match state.

> **Reconcile** matches the transactions, **Refresh from Shopify** reads the payout again, **Fee Entry** opens the fee journal entry.

ITEM	RULE

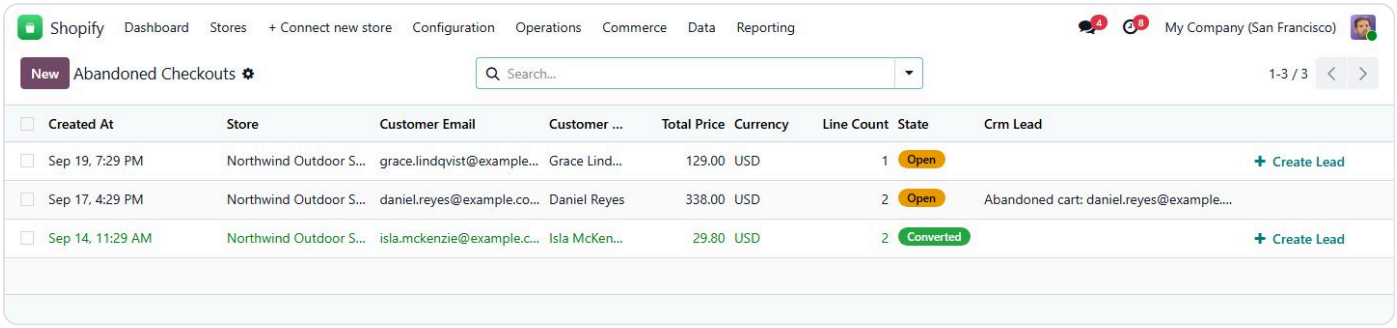

Statement line	Each payout is a draft statement line on the payout journal, in the currency Shopify paid in. Never posted for you
Fee entry (Book Shopify fees on)	One draft entry per paid payout: fee account debited, the payout journal's suspense account credited, referenced Shopify fees payout N. Follows fee changes while draft
Charge matched	Its order has a posted invoice with a payment for that amount in the Shopify Payments journal
Refund matched	Its order's Shopify refund has a credit note for that amount
Adjustment, reserve, dispute	Needs Review, with the reason in the note
Fully Matched	Every charge and refund matched and the transactions sum to the payout; otherwise Partially Matched, with what is open

Under **Shopify, Data, Payout Transactions** all transactions of all payouts can be filtered and grouped. A scheduled payout is read again on every pull until it is paid. Nothing here posts or reconciles accounting; the statement line is matched in the bank reconciliation the usual way.

PART 16 Abandoned checkouts, collections and discount codes

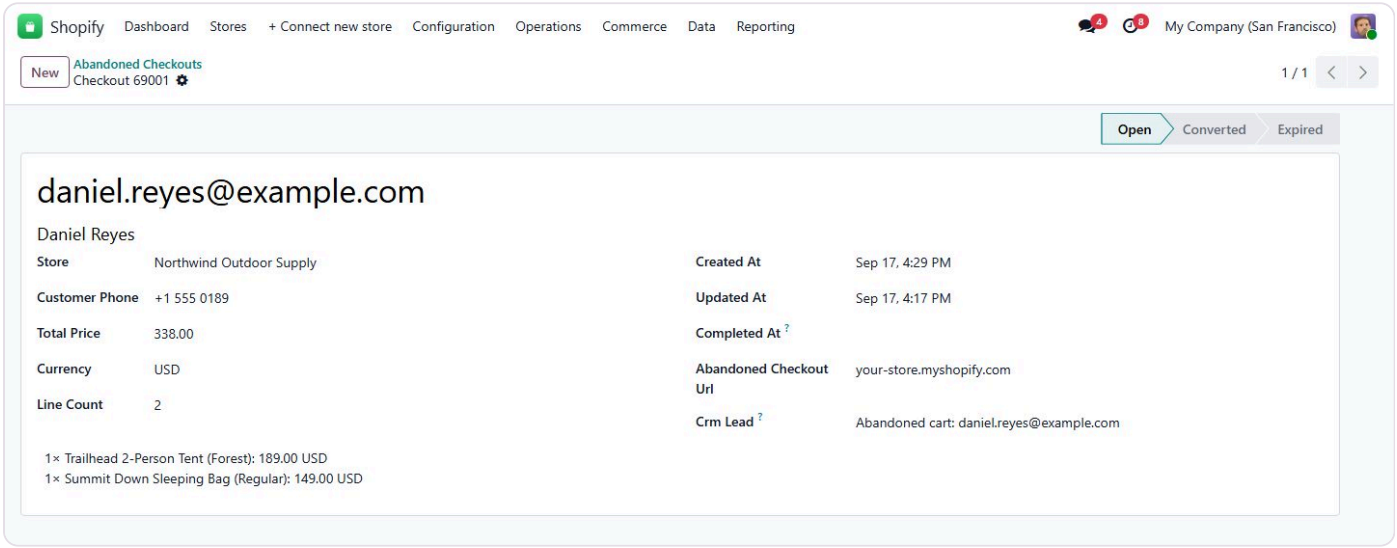

1 Abandoned Checkouts

Carts left at checkout, with the date, store, customer email and name, total, currency, line count, state (open, converted, expired) and the CRM lead.

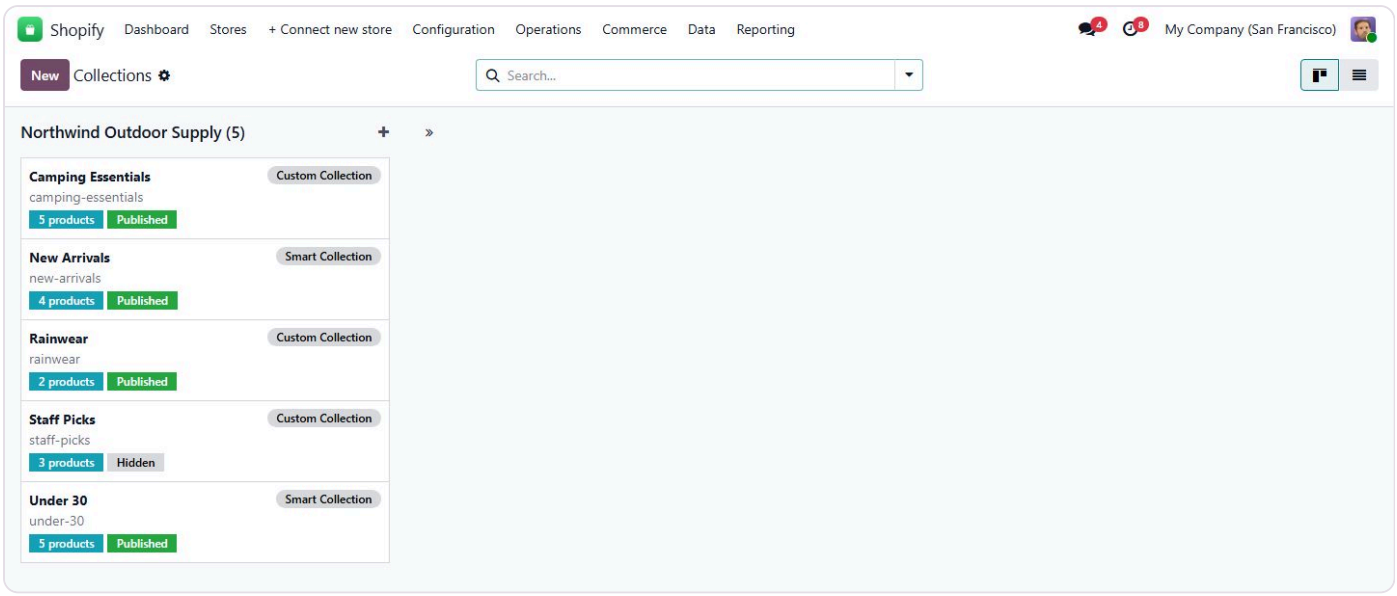

2 A checkout

The checkout's customer, totals, lines and its recovery link. **Create CRM Lead** makes a lead for the sales team; with **Auto create lead from checkout** on, it is done on import.

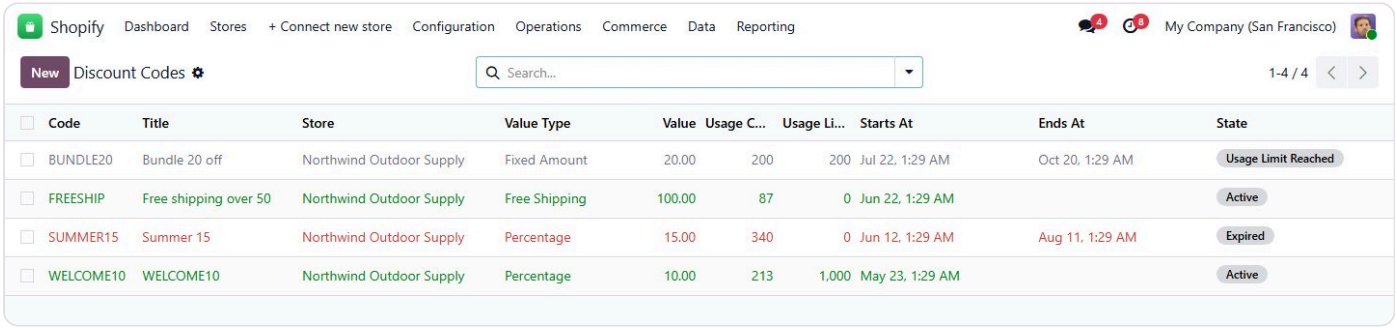

3 Collections

Custom and smart collections per store, with their handle, how many products and whether published.

4 Discount Codes

Codes with their title, value type and value, usage count and limit, start and end, and state (active, expired, usage limit reached).

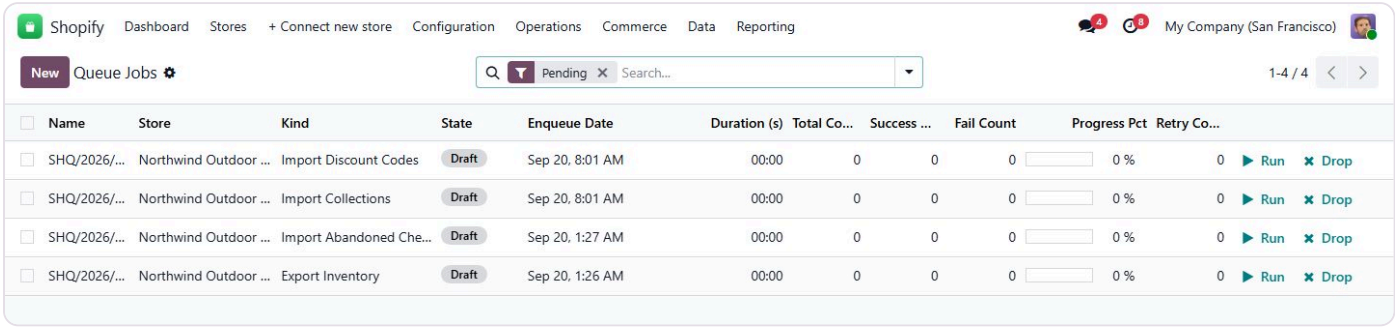

Code	Title	Store	Value Type	Value	Usage C...	Usage Li...	Starts At	Ends At	State
BUNDLE20	Bundle 20 off	Northwind Outdoor Supply	Fixed Amount	20.00	200	200	Jul 22, 1:29 AM	Oct 20, 1:29 AM	Usage Limit Reached
FREESHIP	Free shipping over 50	Northwind Outdoor Supply	Free Shipping	100.00	87	0	Jun 22, 1:29 AM		Active
SUMMER15	Summer 15	Northwind Outdoor Supply	Percentage	15.00	340	0	Jun 12, 1:29 AM	Aug 11, 1:29 AM	Expired
WELCOME10	WELCOME10	Northwind Outdoor Supply	Percentage	10.00	213	1,000	May 23, 1:29 AM		Active

PART 17 The queue and the logs

Every sync is a job. When something goes wrong, the job says what, and the log says when.

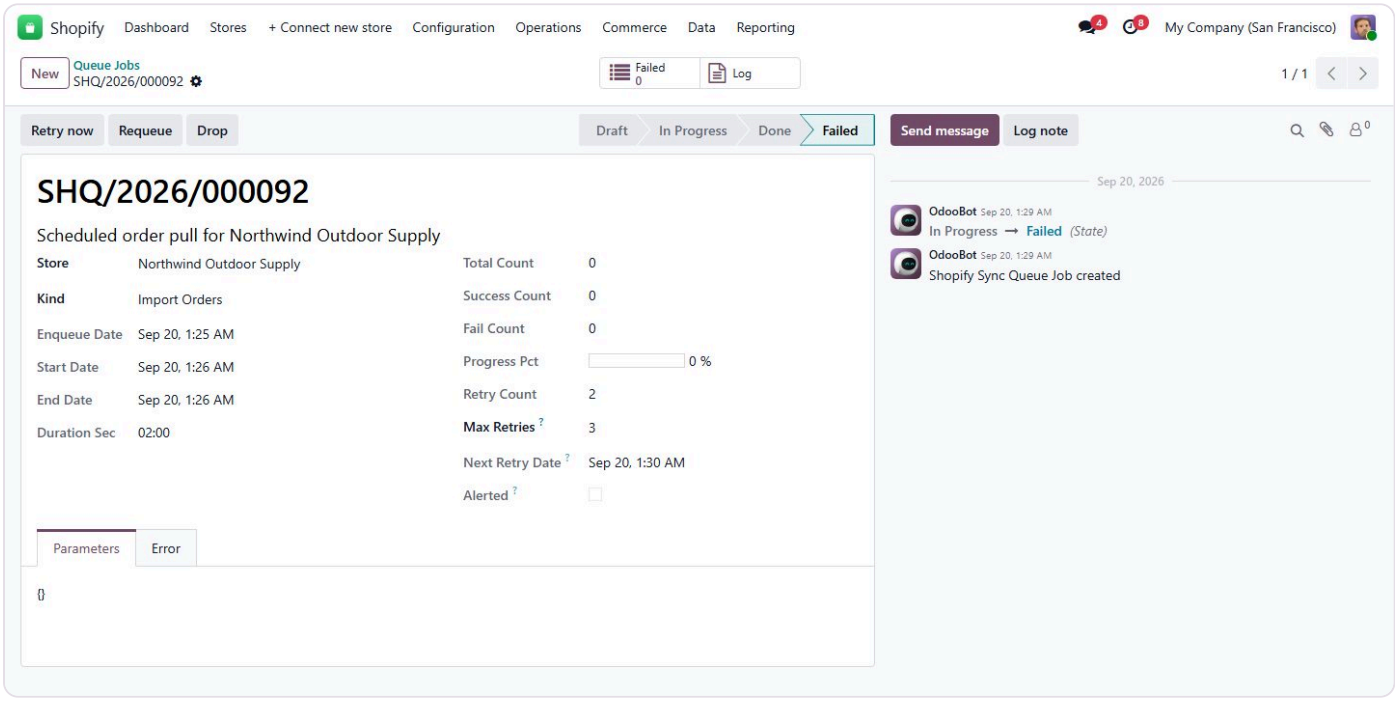

1 Shopify, Operations, Queue Jobs

Each job with its store, kind, state (draft, in progress, done, failed, cancelled), enqueue date, duration, totals, successes, failures, progress and retries, with **Run** and **Drop** on the row. Filters pick pending, failed and done jobs.

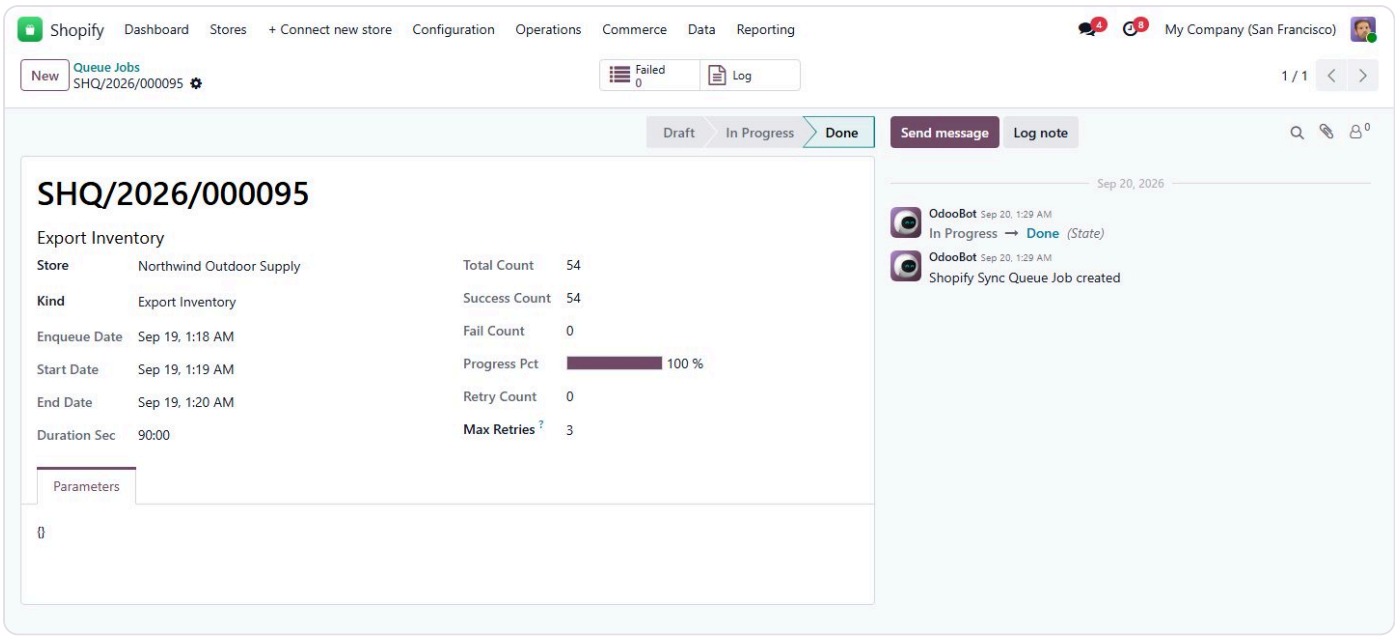

2 A failed job

The header has **Retry now** (run again at once), **Requeue** (back for the next schedule) and **Drop** (mark done without running). The form shows the counts, the retry count and limit, the next retry date and whether an alert was raised; the **Error** tab holds what Shopify or Odoo said.

3 A finished job

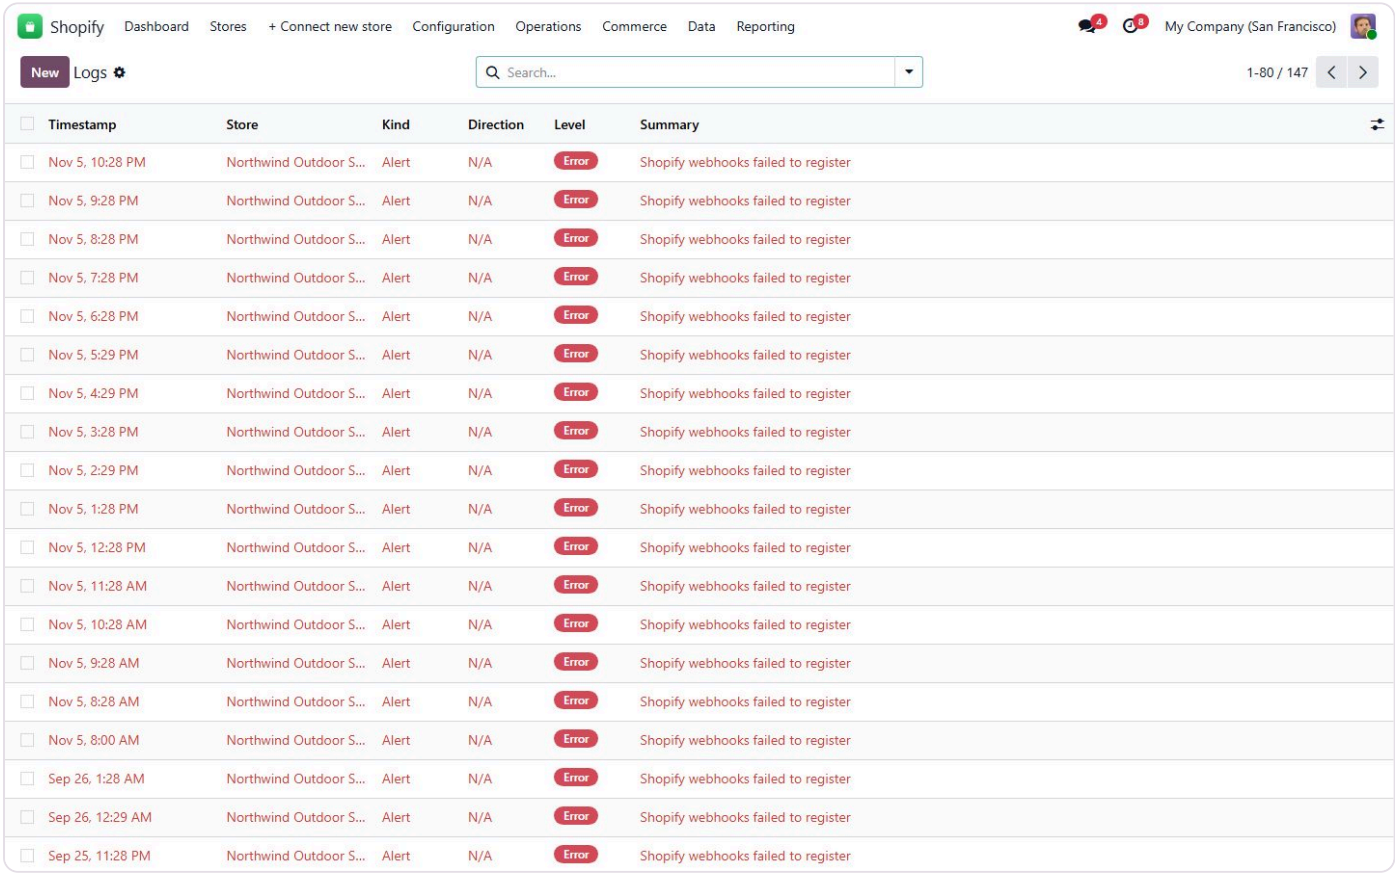

A done job shows its totals and progress; the **Log** smart button opens exactly the log lines it wrote.

4 Shopify, Operations, Logs

One line per attempt: timestamp, store, kind, direction, level and summary. Group by store, kind, level or day; the Errors filter shows only failures. **Action, Export Log Book** writes a store, a date range and a level to CSV.

> Log lines older than Log retention (90 days by default) are deleted by a daily cleanup; 0 keeps all.

MESSAGE	MEANING AND FIX
401, Invalid API key or access token	The token was revoked or the app uninstalled; connect the store again

403 with a scope name	Add that scope to the app and install it again
429	Shopify's rate limit; the job backs off and retries itself
variant has no SKU	Give the Shopify variant a SKU
SKU A is on product X, SKU B is on product Y	Merge the two Odoo products or clear one SKU, then Retry now
order total differs from Shopify	A tax or shipping mapping is missing; fix it and Retry now
no warehouse for location	Map the location on the Locations tab

PART 18 Dashboard, alerts and the daily digest

ALERT SETTING	MEANING
Alert user	Gets an activity on the store for each issue, one open activity per issue
Alert email	Gets an email, at most one per store per kind per hour
Alert on failed job	A job that runs out of retries raises an alert
Webhook stale hours	Alert when the orders webhook was silent this long while a scheduled pull still found orders; 0 off

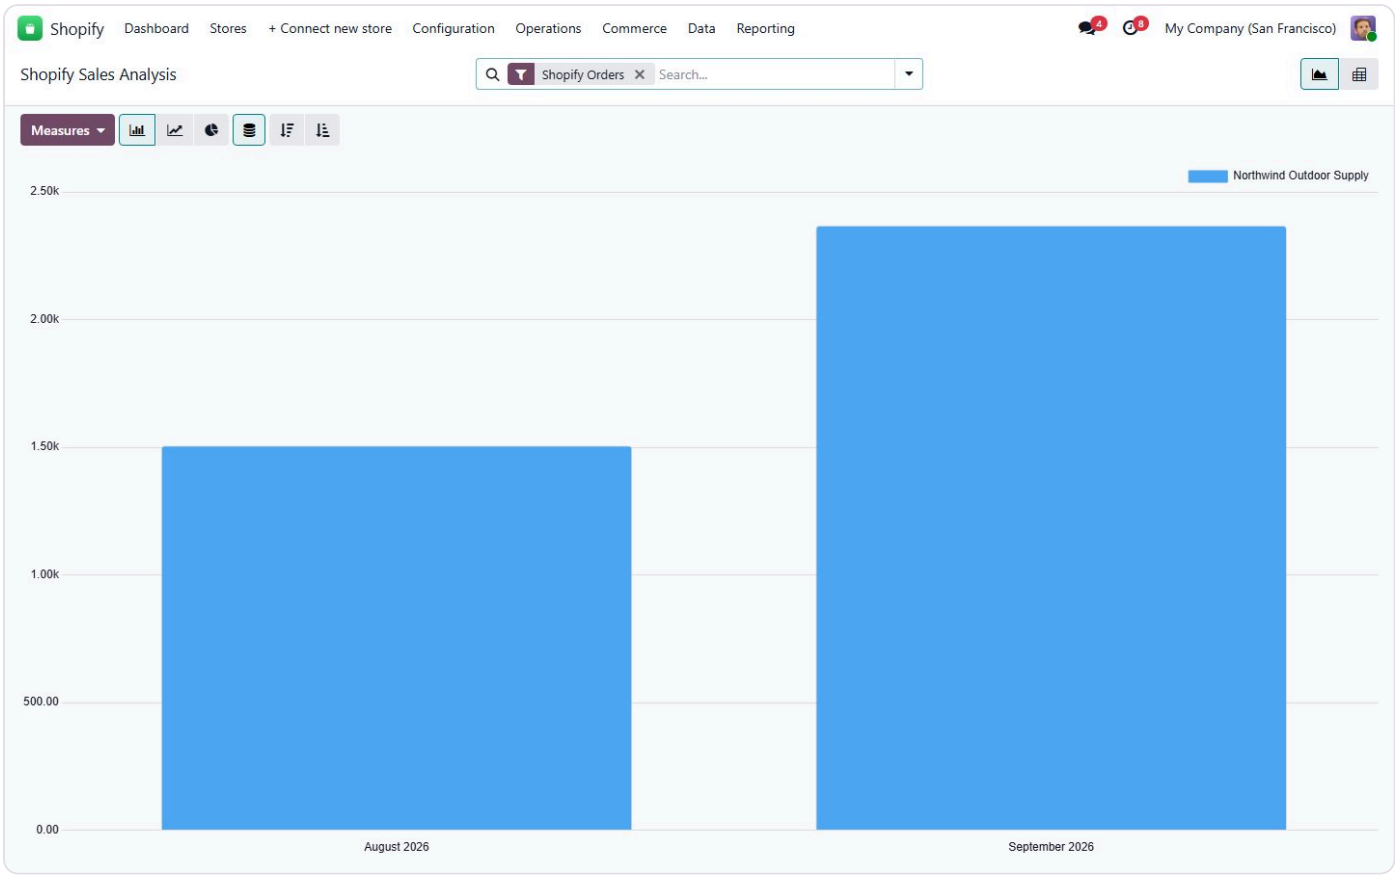

An hourly **watchdog** also raises a store in error and a connected store with no location. The dashboard banner shows the same issues, and **Heal all** retries failed jobs and registers failing webhooks again. Marking the activity done once fixed clears it.

The **Digest** is a daily email: turn it on, name the users and one extra address, and pick the hour in the company's timezone. It covers the last 24 hours: orders and revenue, failed imports, products and stock synced, customers, refunds, payouts, the queue, webhooks received, open alerts and health issues, with links to the dashboard and the queue. **Send digest now** sends it at once.

PART 19 Reporting

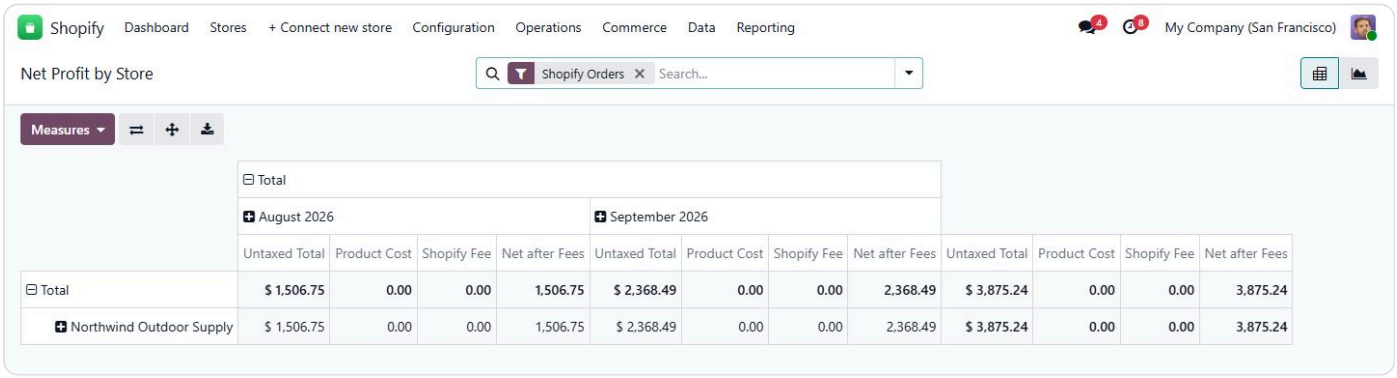

1 Sales Analysis

Odoo's sales analysis for Shopify orders, with store, financial status and Shopify order filters, as a graph or pivot.

2 Net Profit by Store

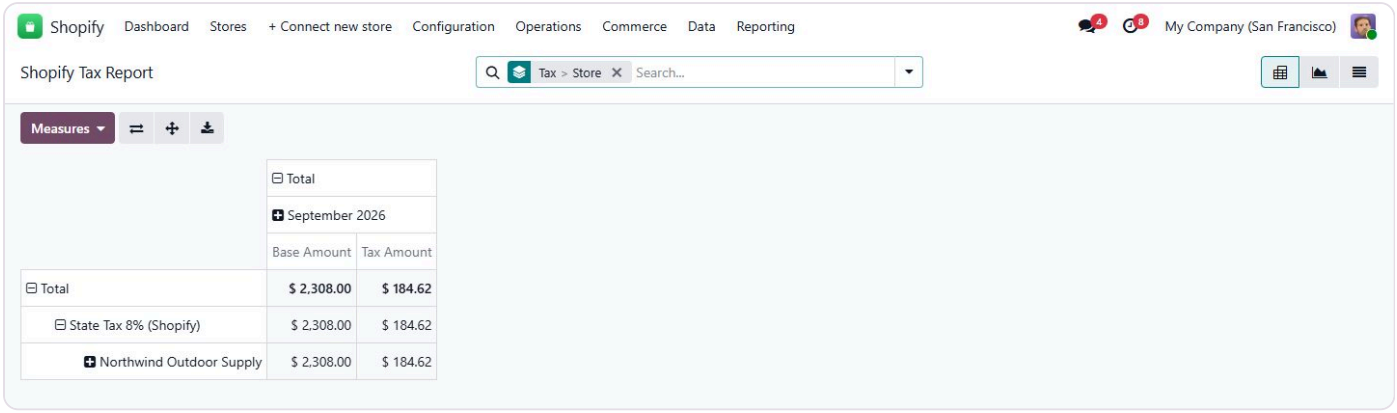

The same analysis with Product Cost (cost price today times quantity), Shopify Fee (the matched charges' fees spread over the lines) and Net after Fees. Built on what was ordered; read it beside Refunds by Month.

	Total				August 2026				September 2026			
	Untaxed Total	Product Cost	Shopify Fee	Net after Fees	Untaxed Total	Product Cost	Shopify Fee	Net after Fees	Untaxed Total	Product Cost	Shopify Fee	Net after Fees
Total	$ 1,506.75	0.00	0.00	1,506.75	$ 2,368.49	0.00	0.00	2,368.49	$ 3,875.24	0.00	0.00	3,875.24
Northwind Outdoor Supply	$ 1,506.75	0.00	0.00	1,506.75	$ 2,368.49	0.00	0.00	2,368.49	$ 3,875.24	0.00	0.00	3,875.24

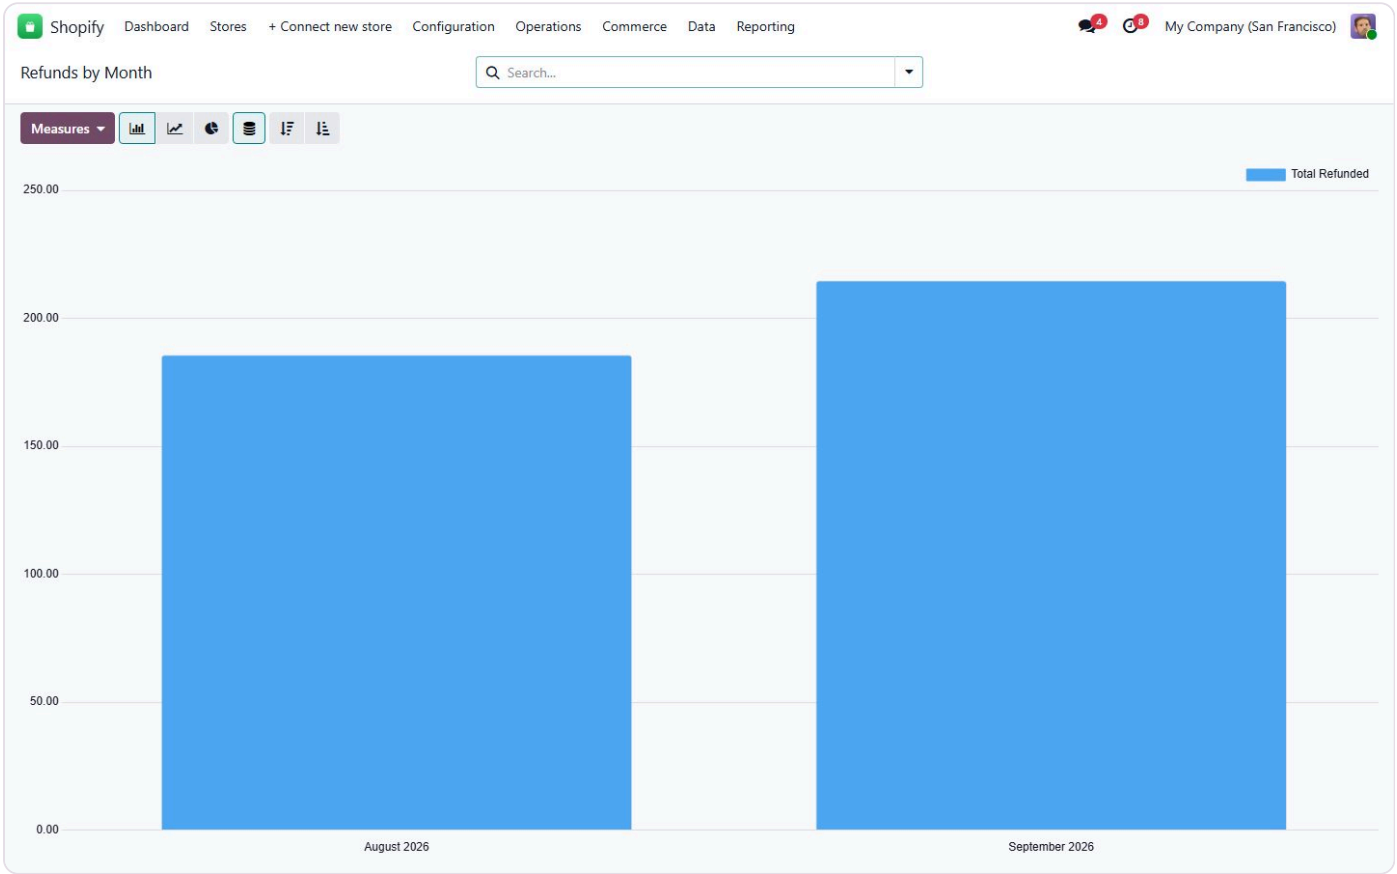

3 Shopify Tax Report

Tax collected on Shopify orders by tax, store and month, from posted invoices and credit notes; a credit note counts negative, so a month's total is what is owed net of refunds.

4 Refunds by Month

Refunded amounts per store and month.

The **Payout Report** has one row per payout transaction with store, payout, month, type, amount, fee, net, order, invoice or credit note and match state, as pivot, graph and list. Fees by store and month are one filter away.

PART 20 Schedules, the demo store and upgrading

Scheduled actions

SCHEDULED ACTION	RUNS EVERY	DOES
Shopify: Process queue jobs	1 minute	Runs waiting jobs
Shopify: Pull recent orders	5 minutes	Pulls orders for stores whose orders interval has passed
Shopify: Push inventory levels	15 minutes	Pushes changed stock per the inventory interval
Shopify: Pull product changes	30 minutes	Per the products interval
Shopify: Pull abandoned checkouts	30 minutes	Per its interval
Shopify: Pull refunds / payouts / collections / discount codes	60 minutes	Each per its own interval
Shopify: Watchdog	1 hour	Raises alerts for stores in error, without location, stale webhooks
Shopify: Digest	1 hour	Sends each store's digest at its hour
Shopify: Delete old log lines	24 hours	Log retention
Shopify: Cleanup stale OAuth + orphan stores	24 hours	Removes unfinished OAuth installs

The Northwind demo store

Load the Northwind demo store (on the store form or the wizard) creates a store that answers from an offline Shopify: products with variants and images, customers, a month of orders, deliveries with tracking, refunds, payouts in two currencies, an edited order, a location with its own stock policy, a compare-at pricelist, abandoned checkouts, collections, discount codes, webhooks and failed jobs. Every button works with no network. Delete the store to remove it.

Upgrading

Replace the module folder and upgrade it from Apps. The upgrade scripts move each store to the pinned API version, turn single product and contact links into one mapping row per store, and switch Shopify fulfilments validate Odoo deliveries off on stores that existed before, so nothing starts validating itself the day you upgrade. Take a database backup first.

PART 21 A fifteen minute walk-through

MINUTE	SHOW	SAY
0 to 2	Dashboard	*Issues, jobs, revenue and queue health in one place, with Heal all*
2 to 4	Stores, Northwind, header and smart buttons	*One store or many; every action is one button*
4 to 6	Locations tab	*Each location to a warehouse, with its own stock policy*
6 to 7	Order Workflow Rules	*Paid orders confirm, invoice and pay themselves*
7 to 9	A product's Shopify tab	*One catalogue, a row per store with its price and publish state*
9 to 11	A Shopify order, its Shopify tab, its delivery	*Fulfilment and tracking go back to Shopify on validate*
11 to 13	Refunds, then a payout	*Credit notes both ways; payouts matched to invoices, fees booked*
13 to 15	Queue Jobs, a failed job	*The reason in plain words, Retry now*

PART 22 Questions

QUESTION	ANSWER
Does Odoo have a Shopify connector built in?	Not Odoo 19 Community. This module runs inside your Odoo with no external service
Will the first import copy products I already have?	No. Variants are matched on SKU or barcode, customers on email; a match is linked, and a dry run shows what would happen
Can one Odoo run several stores?	Yes. Each store has its own credentials, warehouses, journals, rules, alerts and schedules; one product can be on several stores
What if Shopify is down?	Jobs back off and retry; a job out of retries keeps its reason and alerts the alert user
Can Shopify oversell?	By default the free quantity is pushed, on hand minus reserved, so units promised to a confirmed delivery are not offered
Two webhooks for one change?	The webhook id removes replays; the Shopify id on each record removes the rest
Does it post accounting for me?	Invoices and payments only when the workflow rules say so. Credit notes, returns, statement lines and fee entries stay draft
Community or Enterprise?	Both, Odoo 19

PART 23

The menu map

Shopify

Dashboard	Live view: issues, jobs running, revenue, queue health, top products, recent orders
Stores	Every connected store: connection, defaults, sync behaviour and mappings
+ Connect new store	The setup wizard: OAuth or access token, test, first imports

Shopify, Configuration

Metafield Mappings	Shopify metafields to Odoo fields, per store, one way or both

Shopify, Operations

Import from Shopify	Products, orders or customers, since a date, with a dry run
Queue Jobs	Every sync as a job with lines, retries and the error
Logs	One line per attempt, groupable, exportable to CSV

Shopify, Commerce

Refunds	Shopify refunds with their credit note and return, both directions

Shopify, Data

Payouts	Shopify Payments payouts, fees and reconciliation
Payout Transactions	Every charge, refund and adjustment behind the payouts
Abandoned Checkouts	Carts left at checkout, with a CRM lead
Product Mappings	One row per product per store
Customer Mappings	One row per contact per store
Collections	Custom and smart collections
Discount Codes	Price rules and their codes

Shopify, Reporting

Sales Analysis	Shopify orders by store, status, month
Refunds by Month	Refunded amounts per store
Payout Report	Payout transactions, fees and nets
Net Profit by Store	Revenue less product cost less Shopify fees
Shopify Tax Report	Tax collected on Shopify orders, net of credit notes

Inside other apps

Sales order, Shopify tab	Store, Shopify ids, statuses, fulfillment orders
Product, Shopify tab	Catalogue attributes and one row per store
Contact, Shopify tab	Shopify ids per store
Delivery, Push fulfilment	Tracking and the Shopify location

Want your store connected for you?

We create the Shopify app, connect your store, map locations to warehouses, journals and payment methods, run the dry run and the first import against your existing catalogue, and check one product, one order, one delivery and one refund both ways with you before you go live.
