COMPLETE GUIDE · THE TRADE, SETUP AND EVERY SCREEN

Jewellery & Gold Management for Odoo 19

One shop priced off the day's rate per gram: the counter, old gold, the bench, memo issue and stock by weight. Every screen and every step, shown on a live demo. No Odoo background needed.

START

About this guide

Everything a jeweller sells is priced off one number: the rate per gram for the metal and the purity, on the day. This guide starts there and builds the whole shop on top of it, one screen at a time. You do not need to have used Odoo before.

Who it is for

The owner or manager setting the shop up, the salesperson at the counter, the goldsmith at the bench, and anyone being shown the system for the first time.

How to read it

Front to back the first time. Each part opens with what you will learn and a short thing to try on the live demo, then walks every field on every screen.

The live demo

Al Nour Jewellers, a worked example shop with five weeks of real rates, a tray of stock, tickets, buy-backs, repairs and memos already on it. Open it and follow along.

HOW IT WORKS

The demo shop

Address	**jewelry-demo.way4tech.com**
Sign in	**w4demo** / **Demo2026**
Shop	Al Nour Jewellers, Gold Souk · a showroom, a workshop and a shared vault
Runs on	Odoo 19, Community edition

The demo resets from time to time and is shared, so anything you change may be changed back or seen by the next person. Treat it as a shop to walk around, not your own books.

What is in the guide

PART 1	How a jeweller prices a piece	PART 2	The shop at a glance
PART 3	Open the demo and sign in	PART 4	Set the shop up from zero
PART 5	The day's rate	PART 6	Jewellery items
PART 7	Selling at the counter	PART 8	Old gold and buy-back
PART 9	Repairs and custom orders	PART 10	Approval and memo issue
PART 11	Stock count by weight	PART 12	The stone certificate register
PART 13	Reporting	PART 14	The printed documents
PART 15	A fifteen minute walk-through	PART 16	The menu map

PART 1 How a jeweller prices a piece

A jewellery sale is not a price times a quantity. It is the weight of metal in the piece at today's rate, plus the charge for making it, plus the wastage, plus any stones set into it. Once you can see a piece split into those four, the rest of the system follows.

IN THIS PART YOU WILL LEARN

- Why a jeweller cannot put a sticker price on the tray and leave it
- Gross weight, stone weight and net metal, and which one the gold is priced on
- Making charge per gram, as a percentage, or as a fixed amount, and wastage
- What a karat is, what fineness is, and how one rate feeds every purity
- The four parts of a ticket: metal, making, wastage and stones

The price moves every day

Gold is a commodity. Its price moves every day, sometimes every hour, so a ring that was worth one figure on Monday is worth another on Thursday without anybody touching it. That is why a jeweller quotes off the rate for the day and works the price out in front of the customer, rather than printing a price on a tag. The whole module is built around that one habit.

What a piece weighs

Every piece is weighed on three figures. The **gross weight** is what it weighs on the scales, stones and all. The **stone weight** is everything set into it that is not metal. The **net metal weight** is the gross less the stones, and that is the weight the gold is priced on, because nobody pays the gold rate for a sapphire.

HOW IT WORKS

Net metal is what the gold rate is charged on

Gross weight	9.360 g	the whole piece on the scales
– Stone weight	0.340 g	the emerald and the melee diamonds
= Net metal	**9.020 g**	priced at the gold rate for the day

Karat, fineness, and one rate for all of them

Gold is almost never pure. It is mixed with other metal to make it hard enough to wear, and how much gold is in the mix is the **purity**. The trade says it two ways. **Karat** is parts out of 24, so 22K is 22 parts gold out of 24. **Fineness** is the same thing as a fraction, so 22K is 0.916, which is why 22K is also called 916. The shop enters one rate, usually for pure gold, and every other purity is worked out from it by its fineness. Enter the pure rate and the 22K and 18K prices exist at once.

PURITY	KARAT	FINENESS	ALSO CALLED	A GRAM IS WORTH
Pure gold	24K	0.999	999	the full rate
22 karat	22K	0.916	916	91.6% of the rate
18 karat	18K	0.750	750	75.0% of the rate
Sterling silver	-	0.925	925	the silver rate

A shop can still type its own number for 22K on a day it quotes differently from the fineness ratio. A rate entered directly against a purity always wins. Otherwise the pure rate scaled by fineness is used.

Making, wastage and stones

On top of the metal there are three more charges. The **making charge** is the labour, quoted per gram for handwork, as a percentage of the metal value for machine chain and imported pieces, or as a fixed amount for a one-off bought in finished. **Wastage** is the metal lost at the bench in filing, soldering and polishing, charged as a percentage of the weight at the same rate. **Stone value** is taken from the stones set in the piece, which behave nothing like the metal and are priced on their own.

HOW IT WORKS

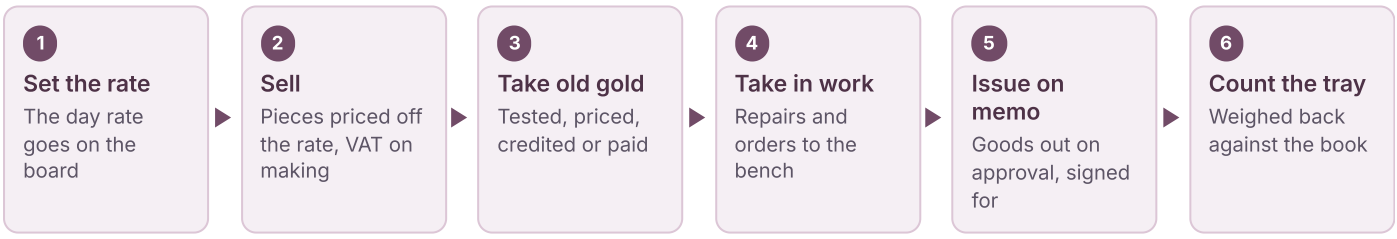

The four parts of a ticket

Metal	net weight × rate for the purity, on the day
+ Making	per gram, a percentage of the metal, or a fixed amount
+ Wastage	a percentage of the weight, priced at the same rate
+ Stones	taken from the stones set in the piece
= Ticket	**what the customer pays before VAT and before any old gold credit**

The system keeps those four apart all the way through, on the ticket, on the invoice and in the reports, because they earn very differently. The metal is passed through at close to cost. The making charge and the stones are where the shop makes its margin.

The day in a jewellery shop

A day at the counter

Those six things are the five areas of the menu you will meet in the next part. Everything in the shop is one of them.

PART 2 The shop at a glance

The module adds one menu, Jewellery, with five areas. This part is the map. Every later part is one area in full. Three kinds of person use the shop, and each sees only what they need.

Who sees what

Salesperson

The counter. Sells pieces, takes in old gold, takes in repairs, issues goods on memo and counts the tray. Sees the day rate but not the settings behind it.

Goldsmith

The bench and nothing else. Opens the jobs assigned to them from My Bench, records the metal in and out, and marks a job ready. No rights on tickets, rates or the books.

Manager

Everything the salesperson sees, plus the reports, the settings, the rate table and the approvals. Signs off a memo over the value limit and sees cost and margin.

The five areas

Counter

Sales	Every counter ticket, priced off the day rate
Old Gold Exchange	Buy-backs: tested, priced, settled
Rate Board	Each purity and what it works out to today

Workshop

Repairs & Custom Orders	Job cards, the metal reconciled on each
My Bench	The jobs assigned to the goldsmith signed in

Stock

Jewellery Items	The pieces, by weight, purity and making charge
Approval & Memo	Goods out on approval, memo or to an exhibition
Count Sheets	The tray counted by weight against the book
Stone Certificates	Every lab report and who is holding it

Reporting

Margin Split	Metal, making and stones per ticket, with margin
Metal, Making & Stones	Every sale line, grouped any way you ask
Stock by Weight	Pieces and grams on hand by purity
Metal Reconciliation	What went to the bench against what came back

Configuration

Settings	VAT basis, hallmark rule, tolerances, memo limit
Counters	Showrooms, workshop and vault, each with its markup
Metal Rates	The day rate per metal and purity, with history
Metals	Gold, silver, platinum and the buy-back margin
Purity Standards	Karat, fineness, the fine and hallmark flags
Stone Types	Diamond, coloured stones, pearls, certificate rule

> On the live demo you are signed in as a user who can see all five areas, so you can follow every part of this guide from the one login. In a real shop the goldsmith would open only My Bench.

PART 3 Open the demo and sign in

Everything in this guide can be followed on the live demo. It is a real Odoo 19 shop, Al Nour Jewellers, already filled with rates, stock and five weeks of trade.

TRY IT YOURSELF ON THE DEMO

1. Open jewelry-demo.way4tech.com in any browser
2. Sign in with w4demo and Demo2026
3. Click Jewellery in the top menu, then Counter, then Sales
4. You are looking at the same screen as the next page of this guide

1

Go to the shop

Open **jewelry-demo.way4tech.com**. The sign-in screen is the standard Odoo one. There is nothing to install and nothing to pay.

The address works on a phone, a tablet or a computer. The counter screens are built for a desktop or a tablet in the shop.

2

Sign in

User `w4demo`, password `Demo2026`. This login can see every part of the shop so you can follow the whole guide, which is why it is not how a real shop would set a salesperson up.

The demo is shared and resets now and then. Anything you change may be put back or seen by the next visitor, so treat it as a showroom to walk around rather than your own books.

3

Find the menu

The **Jewellery** menu sits in the bar across the top, next to the other Odoo apps. Everything in this guide is under it.

PART 4 Set the shop up from zero

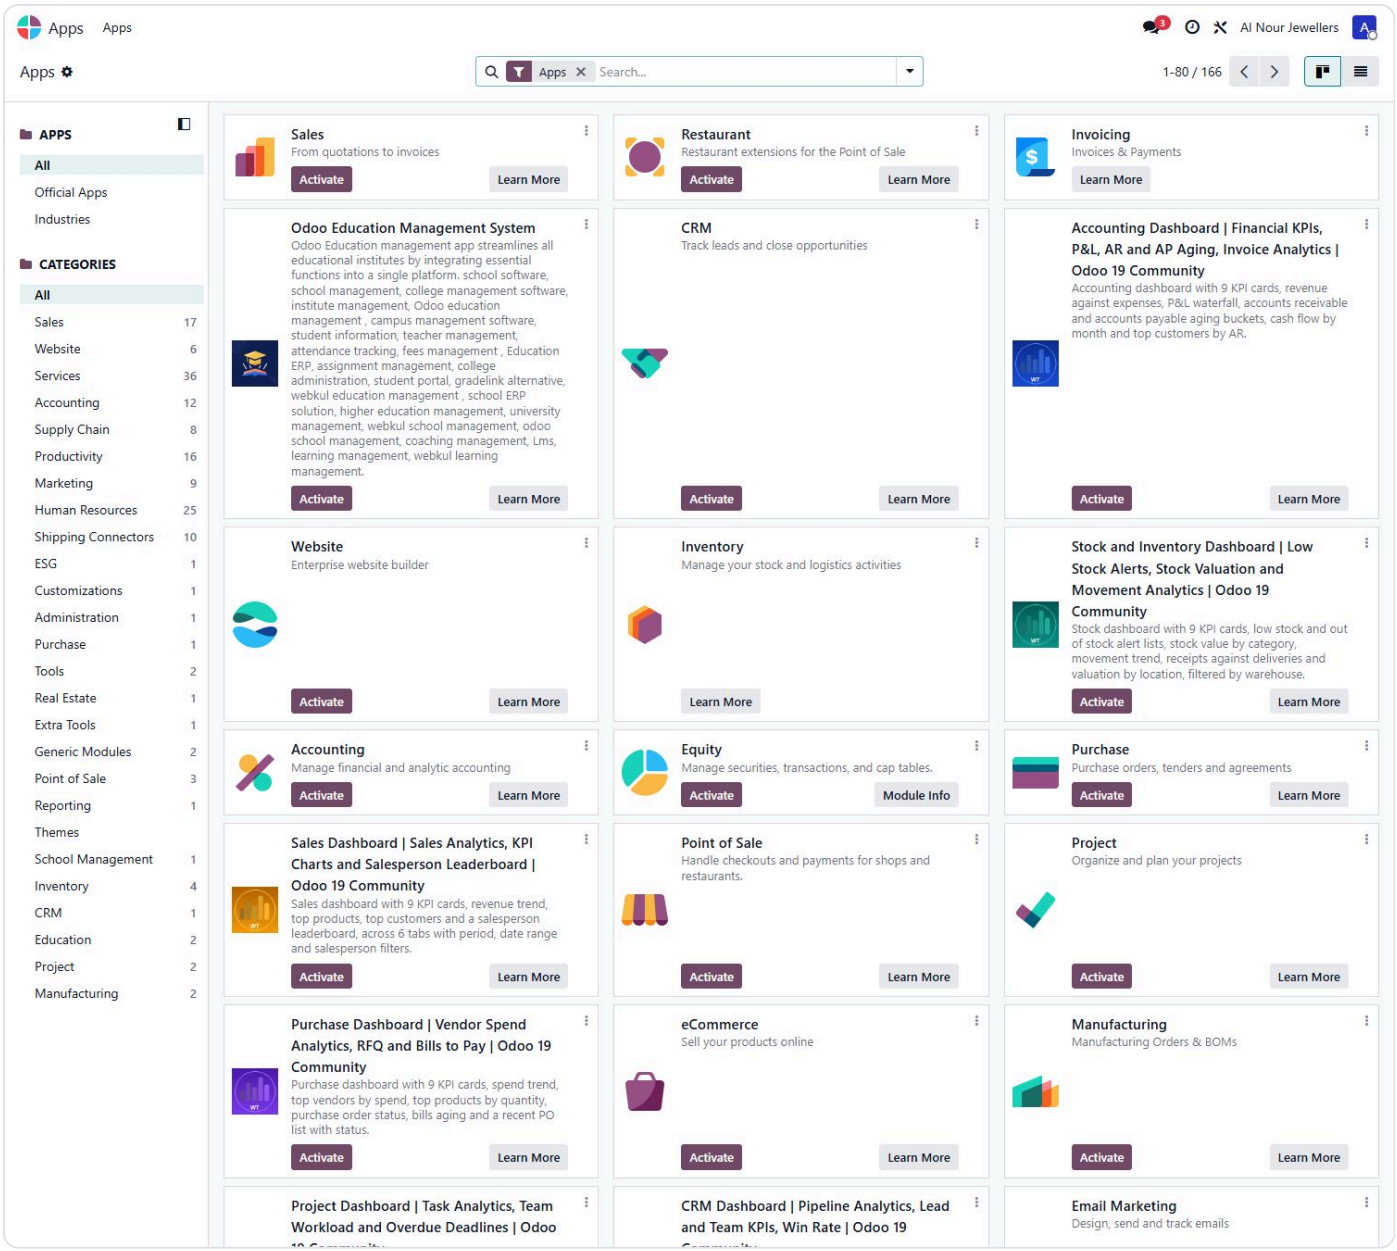

This part is what a new shop does on day one, before it sells anything: install the app, set how the shop trades, and enter the metals, purities, stones and counters it works with. On the demo this is already done, so read it to understand what each setting means and where it lives.

IN THIS PART YOU WILL LEARN

- Installing the Jewellery app and what it brings with it
- The eight shop settings, what each one does, and a sensible default
- Metals and the buy-back margin that comes off the fine rate
- Purity standards, the fine standard and the hallmark standard flags
- Stone types and which ones demand a certificate
- Counters: a showroom, a workshop and a vault, each with its own markup

Install the app

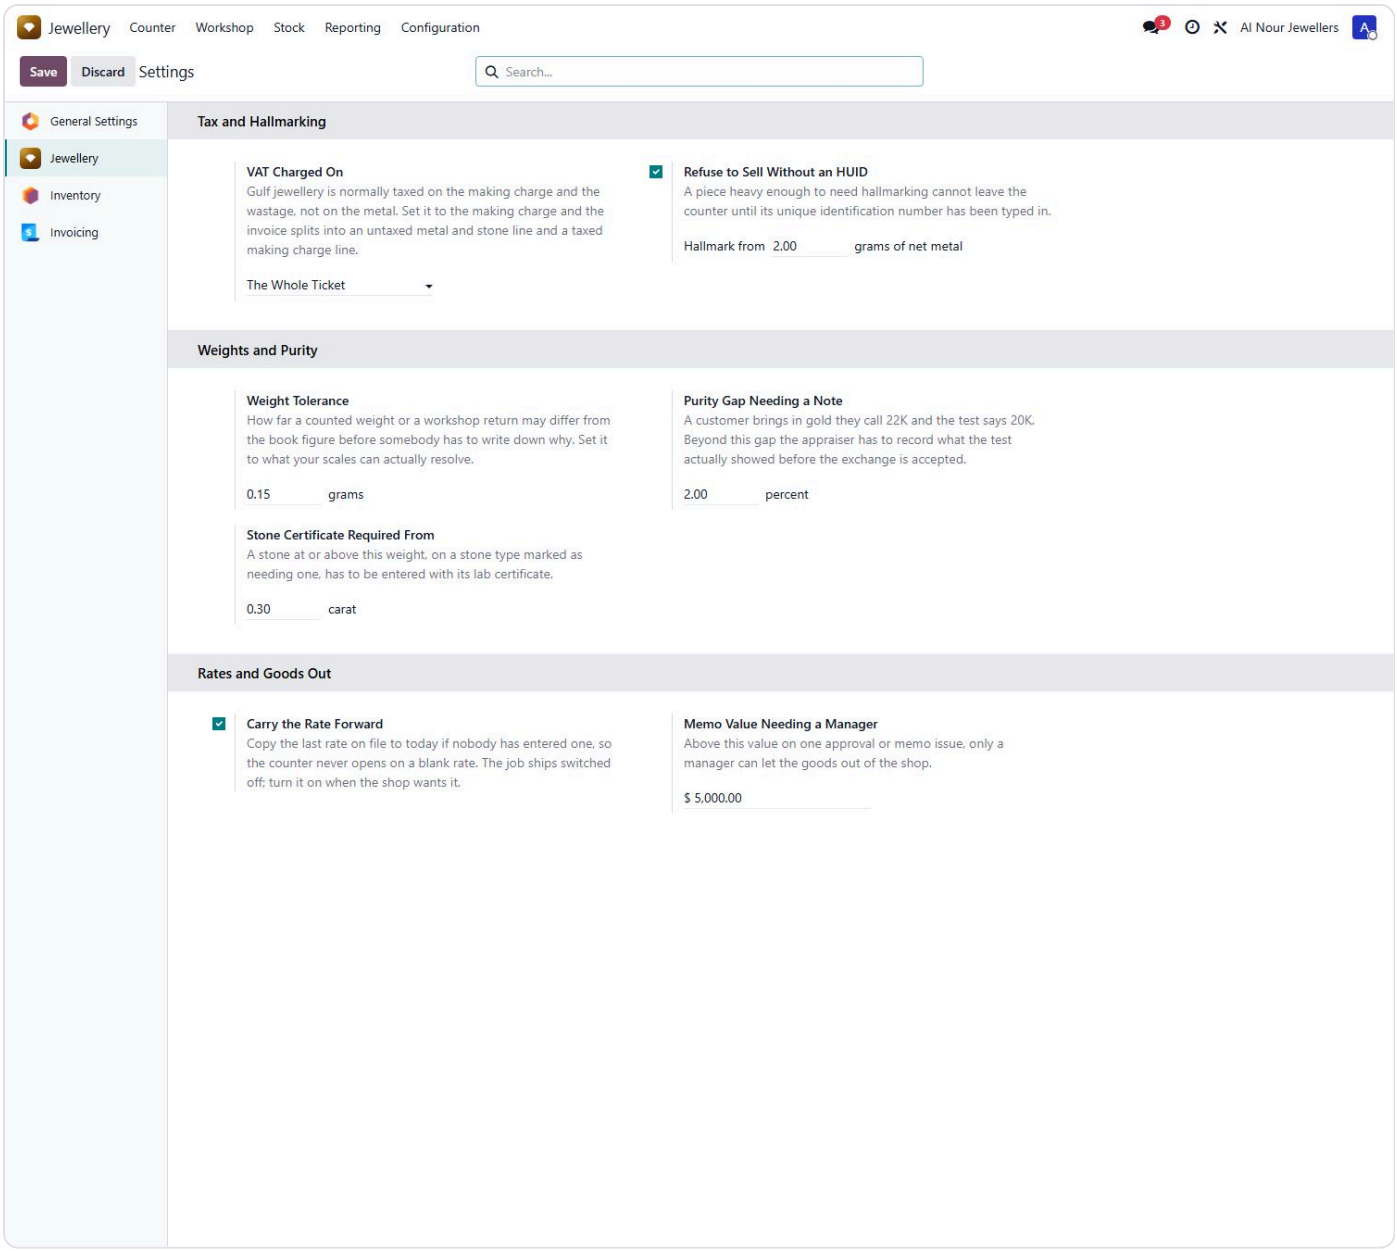

The module is called **Jewelry Management**. Open Apps, search for it, and press Install. It needs Inventory and Accounting, which it pulls in for you, because a piece of jewellery is a thing in stock that is also sold and invoiced. After it installs, the Jewellery menu appears in the top bar.

The app in Apps. One install brings the rate table, the counter, the workshop, memo issue and stock by weight.

Set how the shop trades

Jewellery, then Configuration, then Settings. Eight settings decide how the whole shop behaves. They are worth understanding once, because they are the rules the counter and the bench are held to.

Configuration, then Settings. Every rule the shop runs on sits on this one page.

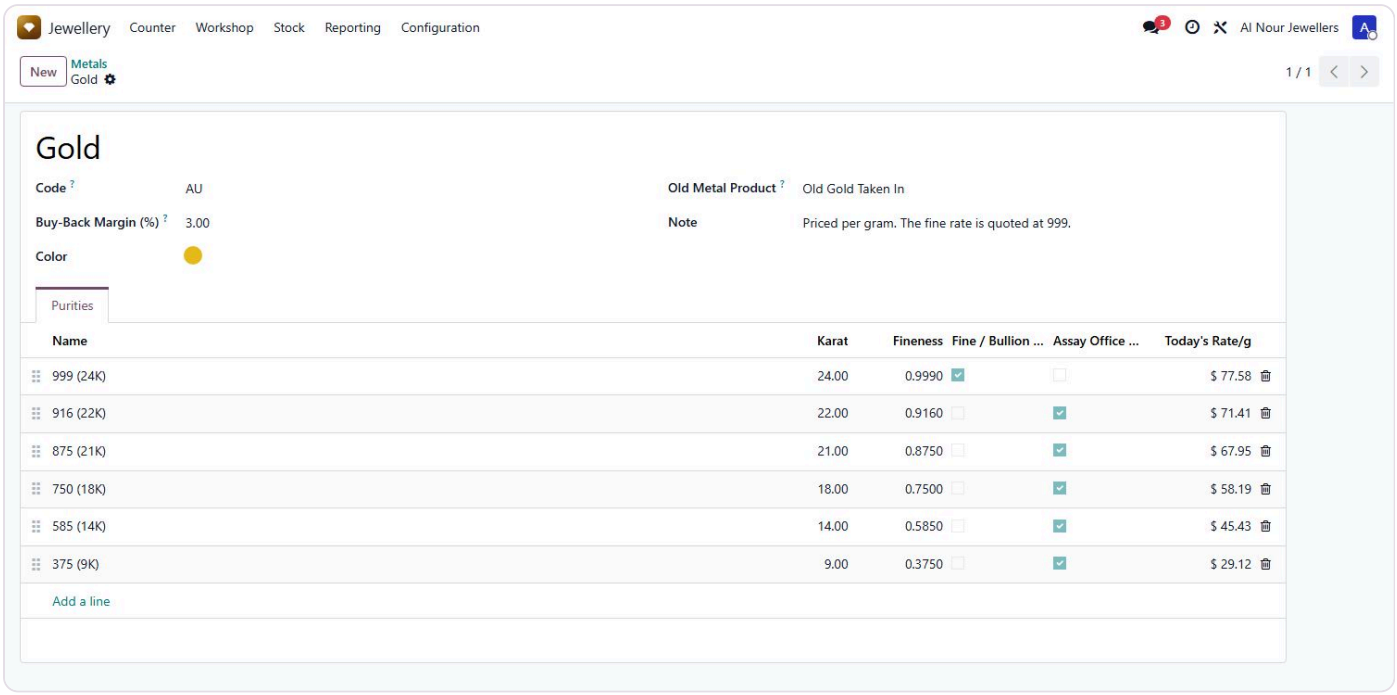

SETTING	WHAT IT DOES	DEFAULT
VAT charged on	Tax the whole ticket, or only the making charge and wastage. In the Gulf, jewellery is taxed on the making charge, not on the metal. Set to making only and the invoice splits into an untaxed metal line and a taxed making line.	The whole ticket
Refuse to sell without an HUID	A piece heavy enough to need hallmarking cannot leave the counter until its unique identification number is typed in.	On
Hallmark from	The net metal weight at or above which a piece must carry an HUID. Thin chain and light findings are usually exempt.	2.0 g
Weight tolerance	How far a counted weight or a workshop return may differ from the book before somebody has to write down why. Set it to what your scales can actually resolve.	0.15 g
Purity gap needing a note	When old gold tests this far from what the customer claimed, the appraiser has to record what the test showed before the credit is worked out.	2.0 %

Carry the rate forward	If nobody has entered a rate today, copy yesterday's so the counter never opens blank. The copy is marked as carried, not quoted.	On
Memo value needing a manager	Above this value on one approval or memo, only a manager can let the goods out of the shop.	5,000
Certificate required from	A stone at or above this weight, on a stone type marked as needing one, cannot be entered without its lab certificate.	0.30 ct

These are company settings, so a group with several shops can give each company its own VAT basis, hallmark weight and limits.

Metals

Configuration, then Metals. Gold, silver and platinum come ready to use. Each metal carries one number that matters at the counter, the **buy-back margin**: how far under the fine rate the shop buys old metal back. It covers the refining loss and the cost of carrying scrap to the refinery. Three percent on gold is a common starting point.

A metal and its purities on one form. The buy-back margin is what comes off the fine rate when old gold is taken in. The old-metal product sends a buy-back to a purchase account rather than letting it vanish off the sale.

Purity standards

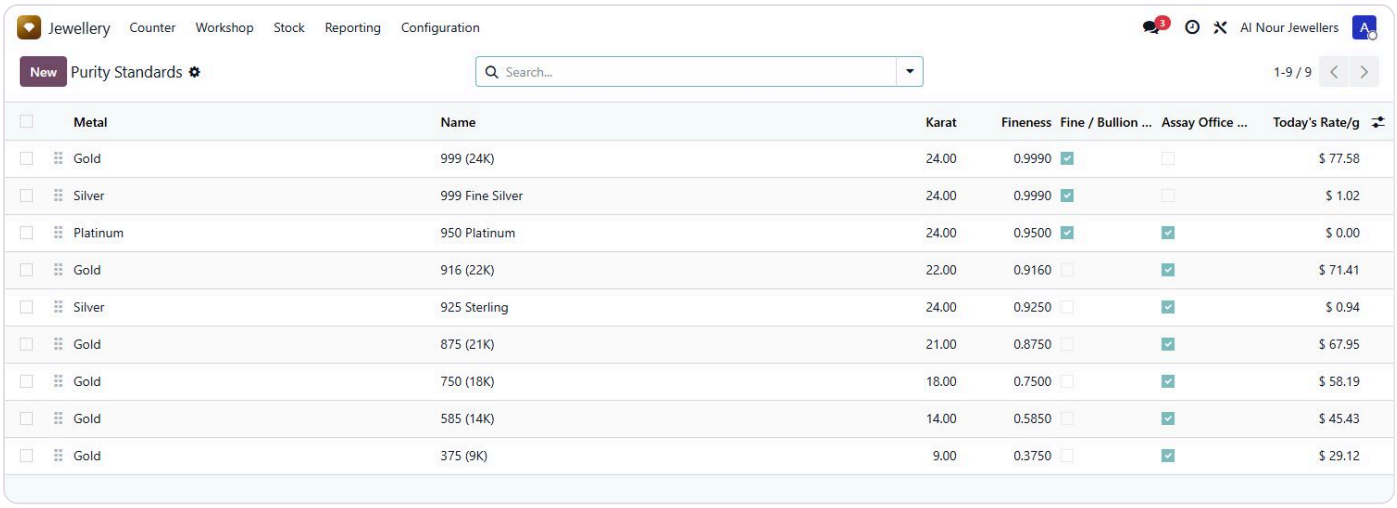

Each metal has its purity standards: 999, 916, 750 for gold, 925 for silver, and so on. A purity carries its **karat** and its **fineness**, and two flags that do real work:

Fine / bullion standard

The standard the bullion rate is quoted at, normally 999 or 24K. Old metal is always credited on the fine rate. One metal has exactly one fine standard.

Assay office will hallmark

The assay office marks pieces at this standard. A piece cannot be recorded as hallmarked on a standard the office does not mark.

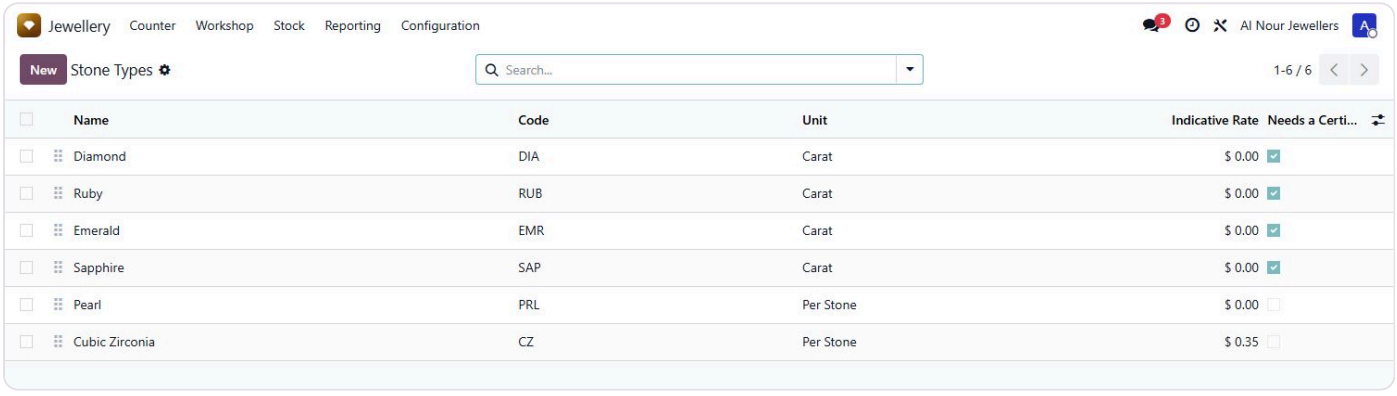

Metal	Name	Karat	Fineness	Fine / Bullion ...	Assay Office ...	Today's Rate/g
Gold	999 (24K)	24.00	0.9990	☑	☐	$ 77.58
Silver	999 Fine Silver	24.00	0.9990	☑	☐	$ 1.02
Platinum	950 Platinum	24.00	0.9500	☑	☑	$ 0.00
Gold	916 (22K)	22.00	0.9160	☐	☑	$ 71.41
Silver	925 Sterling	24.00	0.9250	☐	☑	$ 0.94
Gold	875 (21K)	21.00	0.8750	☐	☑	$ 67.95
Gold	750 (18K)	18.00	0.7500	☐	☑	$ 58.19
Gold	585 (14K)	14.00	0.5850	☐	☑	$ 45.43
Gold	375 (9K)	9.00	0.3750	☐	☑	$ 29.12

The purity standards, grouped by metal. The rate that each works out to today is shown on the right, fed from the one rate the shop enters.

Stone types

Configuration, then Stone Types. Diamonds and coloured stones are priced by carat, pearls and small commercial stones often by the piece. A stone type can be marked as **needing a certificate**, which means a stone of that type above the certificate weight cannot be put on a piece without its lab report attached.

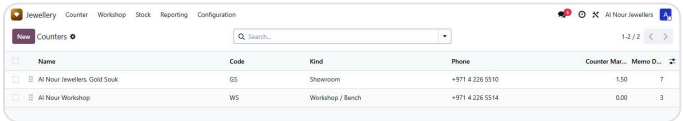

Name	Code	Unit	Indicative Rate	Needs a Certi...
Diamond	DIA	Carat	$ 0.00	☑
Ruby	RUB	Carat	$ 0.00	☑
Emerald	EMR	Carat	$ 0.00	☑
Sapphire	SAP	Carat	$ 0.00	☑
Pearl	PRL	Per Stone	$ 0.00	☐
Cubic Zirconia	CZ	Per Stone	$ 0.35	☐

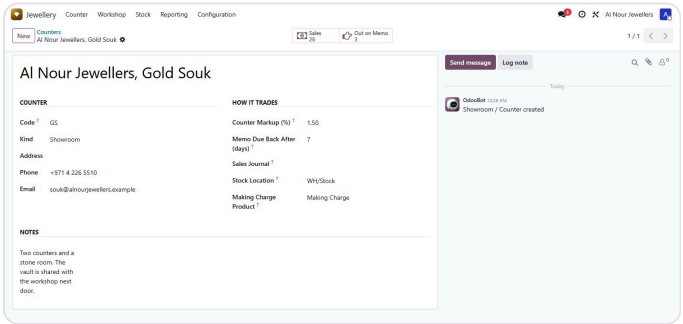

Stone types, each with its unit, an indicative rate and whether it demands a certificate.

Counters

A counter is a showroom, a workshop or a vault. Its **code** goes in front of every sale, memo and job number raised there, so a ticket says which counter took it. Its **markup** is what it adds to the bullion rate before it quotes, because a showroom in a mall runs a point or two over a bullion counter in the souk. The **memo period** is how long goods may stay out before the memo is chased.

The shop's counters: a showroom, a workshop and a shared vault.

A counter sets its markup, its memo period, its sales journal and the stock location its tray is counted against.

PART 5 The day’s rate

This is the number the whole shop prices off. A shop enters one rate a day per metal, against the bullion standard, and every other purity follows by its fineness. Get this habit right and nothing downstream is ever mispriced.

IN THIS PART YOU WILL LEARN

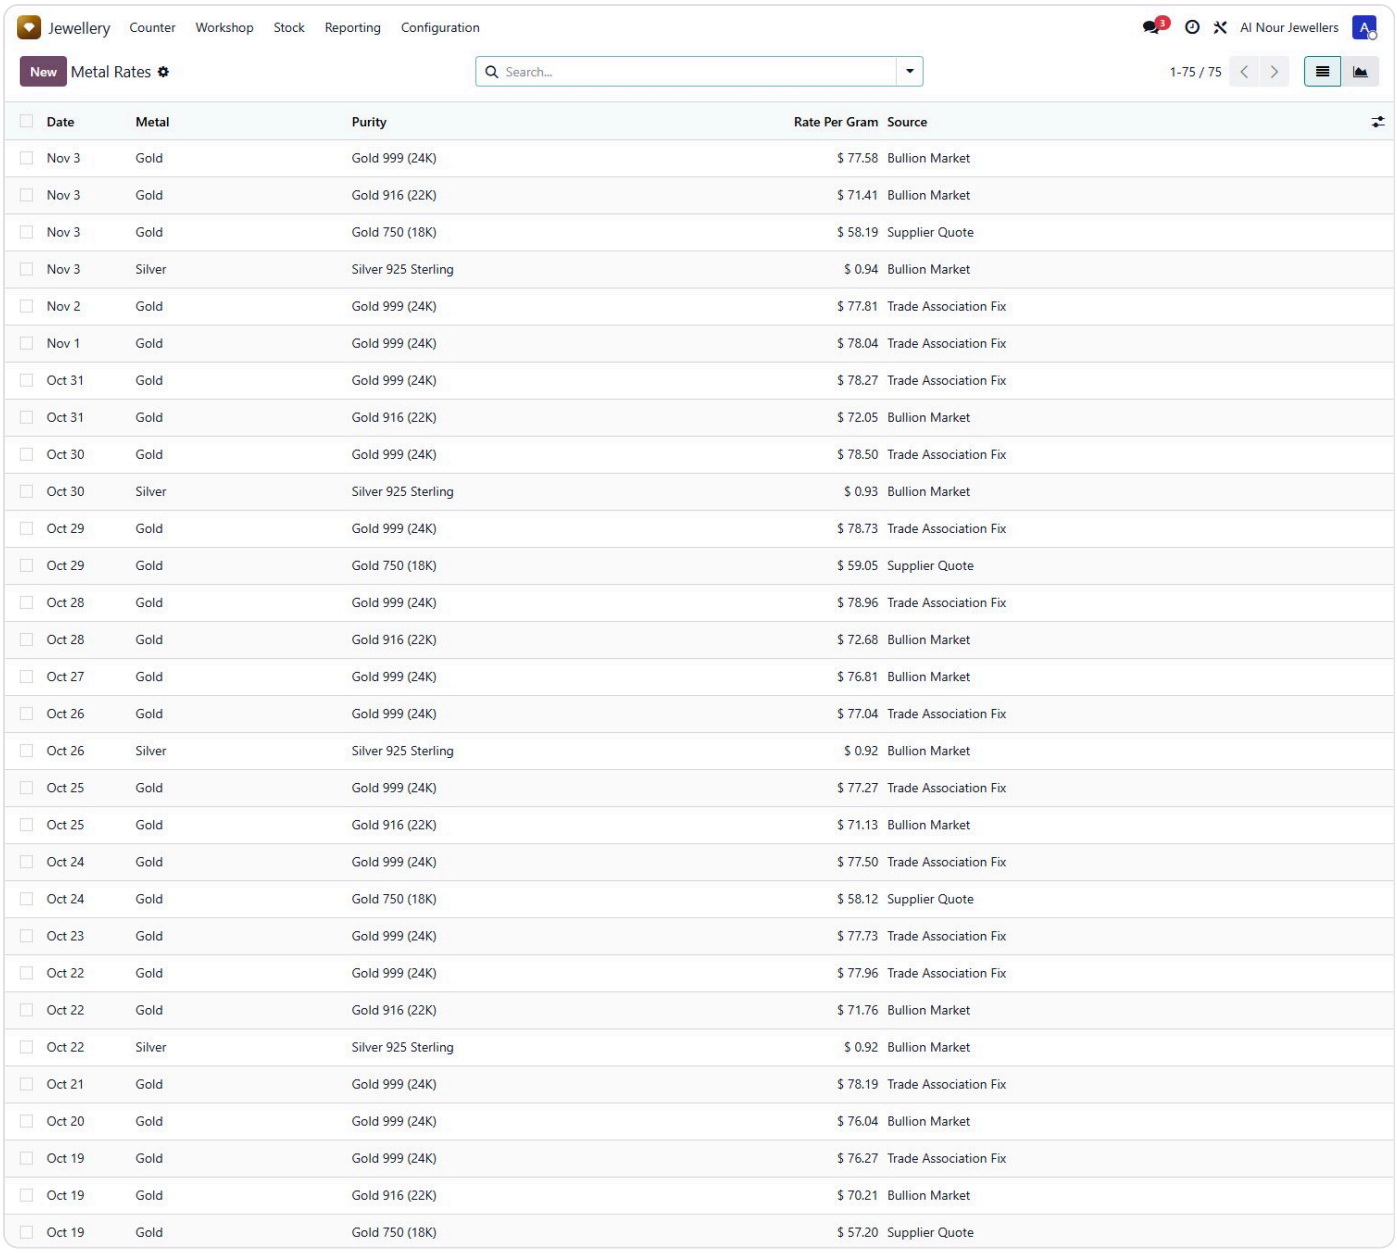

- Entering the day rate and letting every purity follow by fineness
- Quoting your own number for a purity when you mean to
- The rate board: every purity and what it comes to today
- Carrying the rate forward so the counter never opens blank
- The rate history, and why an old ticket keeps the rate it was sold at

TRY IT YOURSELF ON THE DEMO

1. Open Counter, then Rate Board, and read the rate each purity comes to
2. Open Configuration, then Metal Rates, and add today's gold 999 rate
3. Watch the 916 and 750 rates move with it on the board

Enter one rate, price every purity

Configuration, then Metal Rates. Enter one number for the day, normally against the fine standard, and the shop can price 22K, 18K and everything else at once, because each is a known fraction of pure. The row carries where the number came from: the bullion market, a trade association fix, a supplier quote, entered by hand, or carried forward.

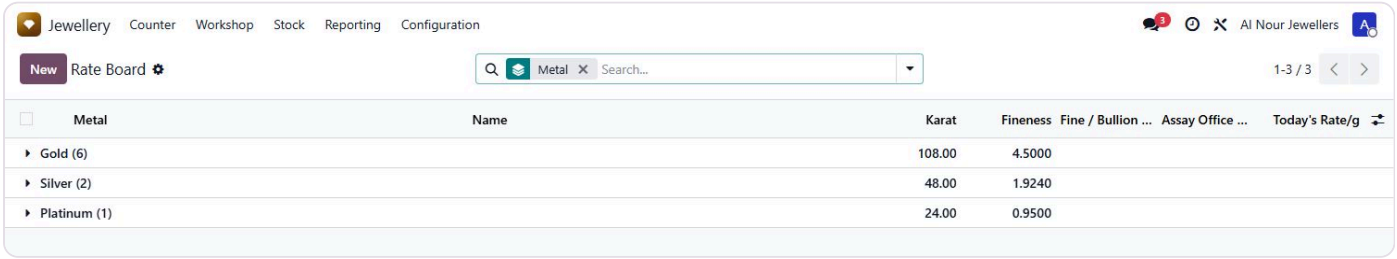

Date	Metal	Purity	Rate Per Gram	Source
Nov 3	Gold	Gold 999 (24K)	$ 77.58	Bullion Market
Nov 3	Gold	Gold 916 (22K)	$ 71.41	Bullion Market
Nov 3	Gold	Gold 750 (18K)	$ 58.19	Supplier Quote
Nov 3	Silver	Silver 925 Sterling	$ 0.94	Bullion Market
Nov 2	Gold	Gold 999 (24K)	$ 77.81	Trade Association Fix
Nov 1	Gold	Gold 999 (24K)	$ 78.04	Trade Association Fix
Oct 31	Gold	Gold 999 (24K)	$ 78.27	Trade Association Fix
Oct 31	Gold	Gold 916 (22K)	$ 72.05	Bullion Market
Oct 30	Gold	Gold 999 (24K)	$ 78.50	Trade Association Fix
Oct 30	Silver	Silver 925 Sterling	$ 0.93	Bullion Market
Oct 29	Gold	Gold 999 (24K)	$ 78.73	Trade Association Fix
Oct 29	Gold	Gold 750 (18K)	$ 59.05	Supplier Quote
Oct 28	Gold	Gold 999 (24K)	$ 78.96	Trade Association Fix
Oct 28	Gold	Gold 916 (22K)	$ 72.68	Bullion Market
Oct 27	Gold	Gold 999 (24K)	$ 76.81	Bullion Market
Oct 26	Gold	Gold 999 (24K)	$ 77.04	Trade Association Fix
Oct 26	Silver	Silver 925 Sterling	$ 0.92	Bullion Market
Oct 25	Gold	Gold 999 (24K)	$ 77.27	Trade Association Fix
Oct 25	Gold	Gold 916 (22K)	$ 71.13	Bullion Market
Oct 24	Gold	Gold 999 (24K)	$ 77.50	Trade Association Fix
Oct 24	Gold	Gold 750 (18K)	$ 58.12	Supplier Quote
Oct 23	Gold	Gold 999 (24K)	$ 77.73	Trade Association Fix
Oct 22	Gold	Gold 999 (24K)	$ 77.96	Trade Association Fix
Oct 22	Gold	Gold 916 (22K)	$ 71.76	Bullion Market
Oct 22	Silver	Silver 925 Sterling	$ 0.92	Bullion Market
Oct 21	Gold	Gold 999 (24K)	$ 78.19	Trade Association Fix
Oct 20	Gold	Gold 999 (24K)	$ 76.04	Bullion Market
Oct 19	Gold	Gold 999 (24K)	$ 76.27	Trade Association Fix
Oct 19	Gold	Gold 916 (22K)	$ 70.21	Bullion Market
Oct 19	Gold	Gold 750 (18K)	$ 57.20	Supplier Quote

The rate table. One fine rate a day is usually enough. A row carried forward overnight is shown in amber so nobody mistakes it for a quoted price.

> A shop can still type its own number for a purity on a day it quotes 22K differently from the fineness ratio. A rate entered directly against a purity always wins over the one worked out from fineness.

The rate board

Counter, then Rate Board. Every purity with the rate it works out to today, grouped by metal. It is the screen the counter glances at before it quotes, and the one to put on a second monitor facing the shop floor.

Metal	Name	Karat	Fineness	Fine / Bullion ...	Assay Office ...	Today's Rate/g
Gold (6)		108.00	4.5000			
Silver (2)		48.00	1.9240			
Platinum (1)		24.00	0.9500			

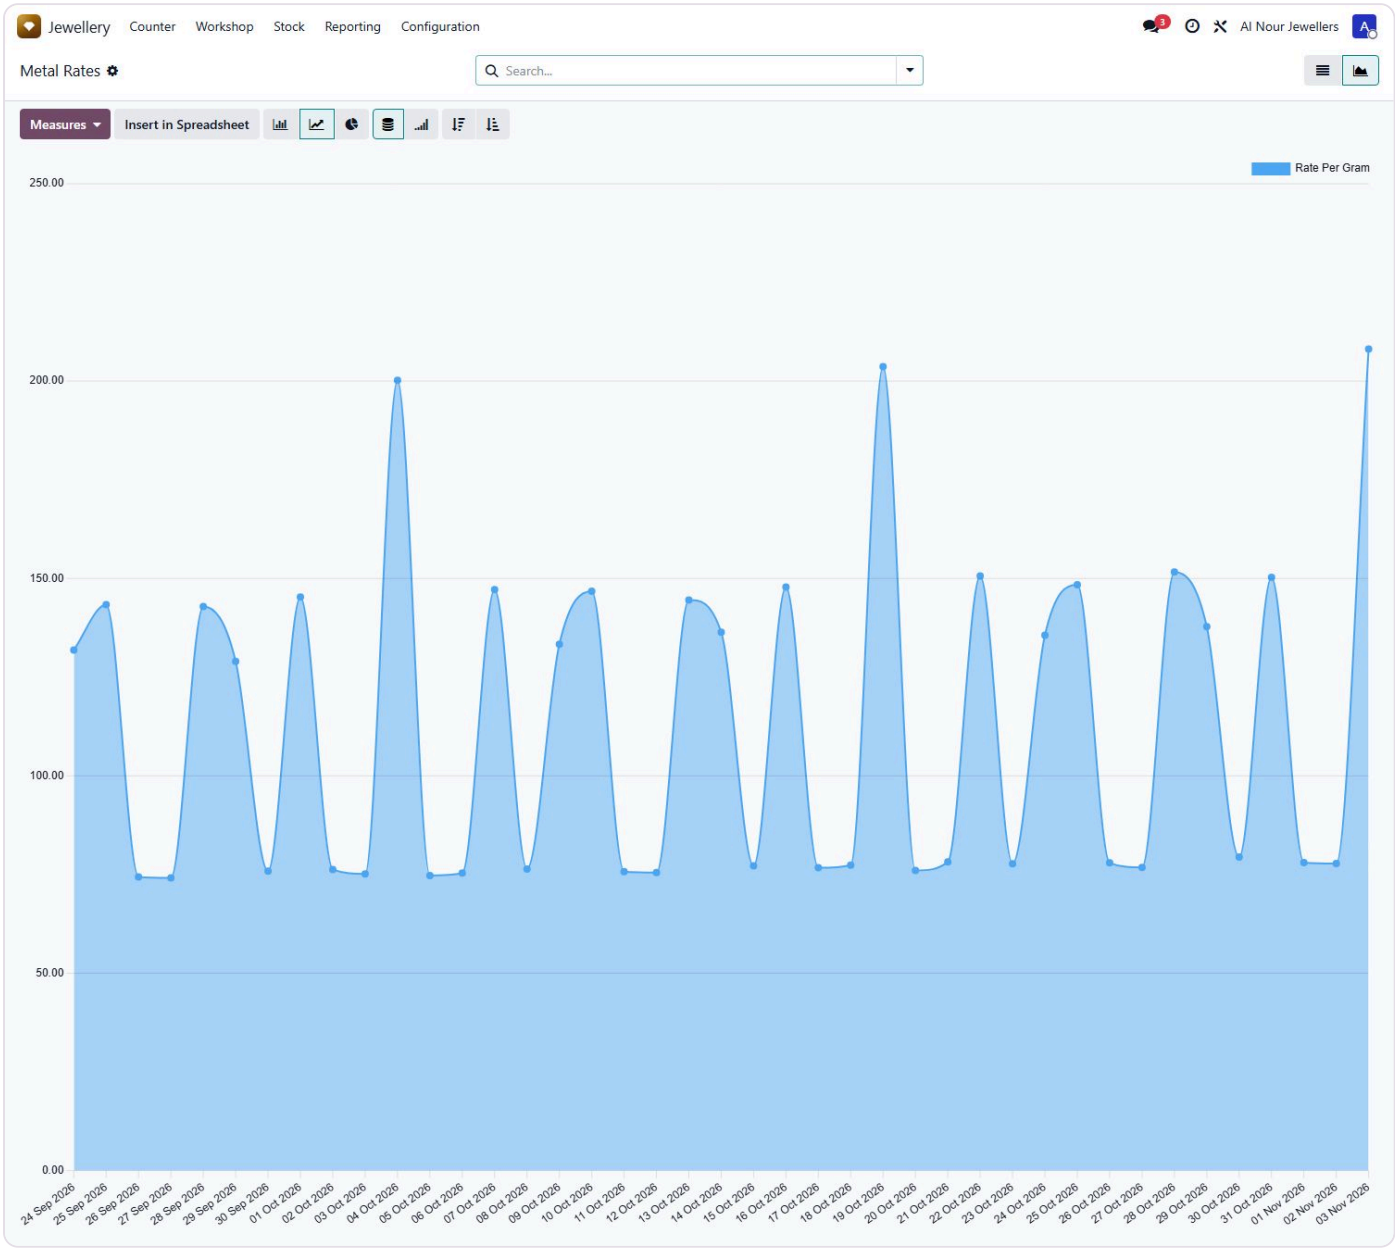

The rate board: each purity and the rate per gram it comes to today, fed from the one rate the shop entered.

Never open on a blank rate

A shop that opens before the market fix still has to quote. With **carry the rate forward** on, an overnight job copies yesterday's rate to today and marks it as carried, so the counter is never blank and everyone can see the number has not been refreshed yet. Replace it the moment the market opens.

The rate is stamped onto the ticket

When a piece is put on a ticket, the rate for the day is stamped onto the line. Months later that ticket still shows the rate it was actually sold at, not whatever gold is worth when you open it again. The rate table keeps its full history, so you can see the market move over any period.

The rate history. The market drifts; this is why a jeweller cannot put a sticker price on the tray and leave it there.

PART 6 Jewellery items

A piece of jewellery is a product, so it sits in stock and sells and invoices like anything else. What is added is what the trade weighs and argues about: metal, purity, the three weights, the making charge, wastage, the hallmark number and the stones set in it.

IN THIS PART YOU WILL LEARN

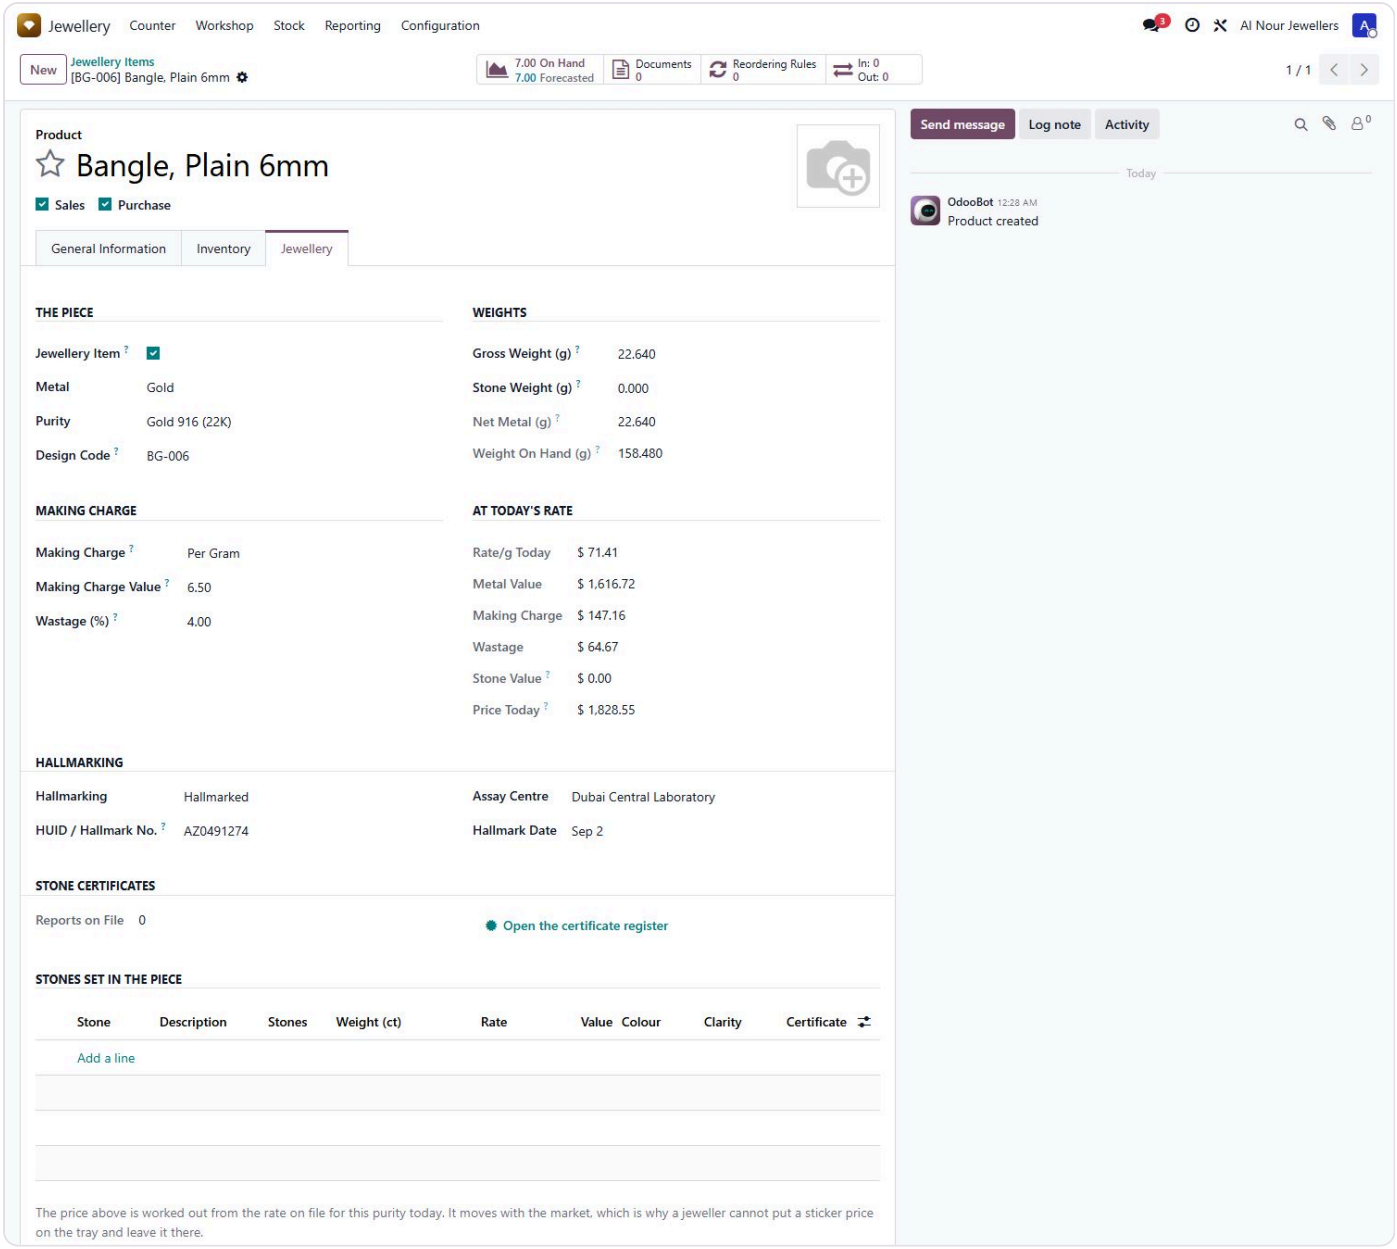

- Turning a product into a jewellery item priced off the rate
- Gross, stone and net weight, and the price the piece comes to today
- Making charge per gram, as a percentage, or fixed, and wastage
- The HUID and the hallmark state, and the rule that guards them
- Listing stones with carat, grade, setting and their certificate

TRY IT YOURSELF ON THE DEMO

1. Open Stock, then Jewellery Items, and open the Emerald Cocktail Ring
2. Open its Jewellery tab and read the price built from today's rate
3. Scroll to the stones and see the emerald with its certificate

What makes a piece

Stock, then Jewellery Items. Tick **Jewellery item** on a product and it is priced from the metal rate instead of from a fixed sales price. Then it carries the metal and purity, the gross and stone weight, the making method and value, the wastage percentage, and the hallmark number stamped on it.

The Jewellery tab on a plain gold bangle. Gross weight, net metal, 22K purity, a making charge per gram and a little wastage. The price it comes to today is worked out live from the rate, and moves with it.

The three weights and the price today

The gross weight is the whole piece. The stone weight comes off, because nobody pays the gold rate for a stone. What is left is the net metal, and that is what the rate is charged on. The form shows the metal value, the making charge and the wastage it all comes to at today's rate, which is the figure a counter quotes from.

Making charge and wastage

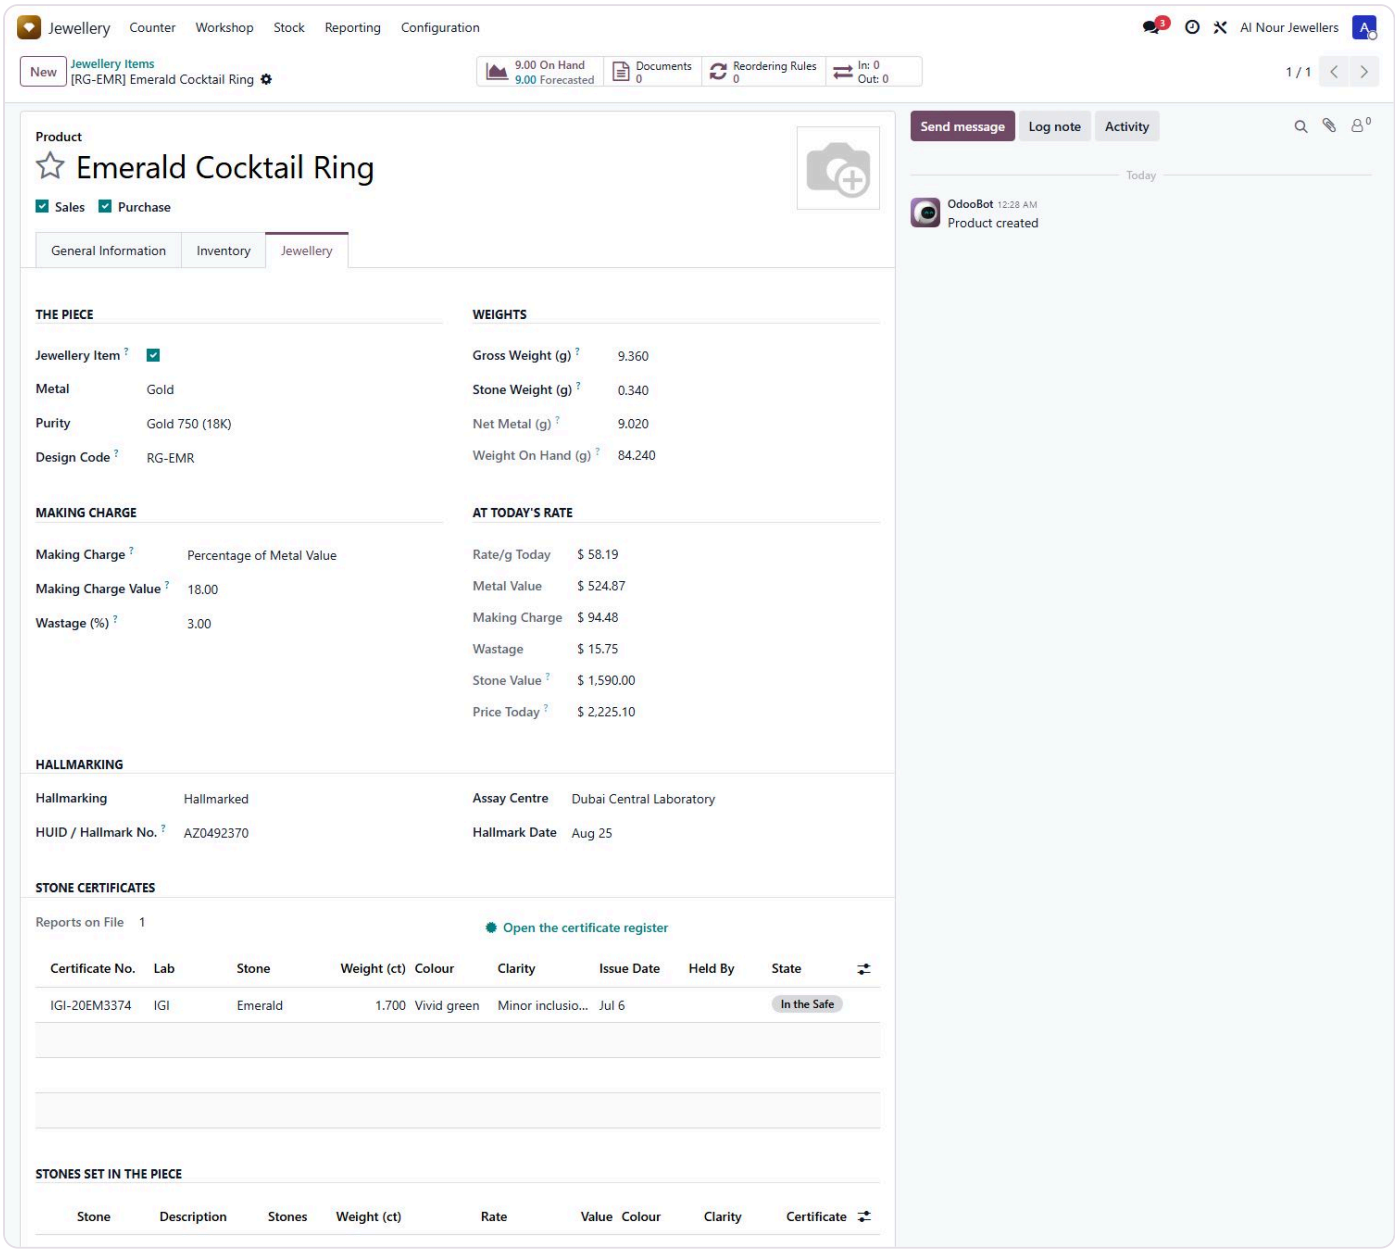

The making charge is quoted one of three ways: **per gram** for handwork, a **percentage** of the metal value for machine chain and imported pieces, or a **fixed amount** for a one-off bought in finished. Wastage is a percentage of the weight, charged at the same rate, to recover the metal lost at the bench.

Hallmark and HUID

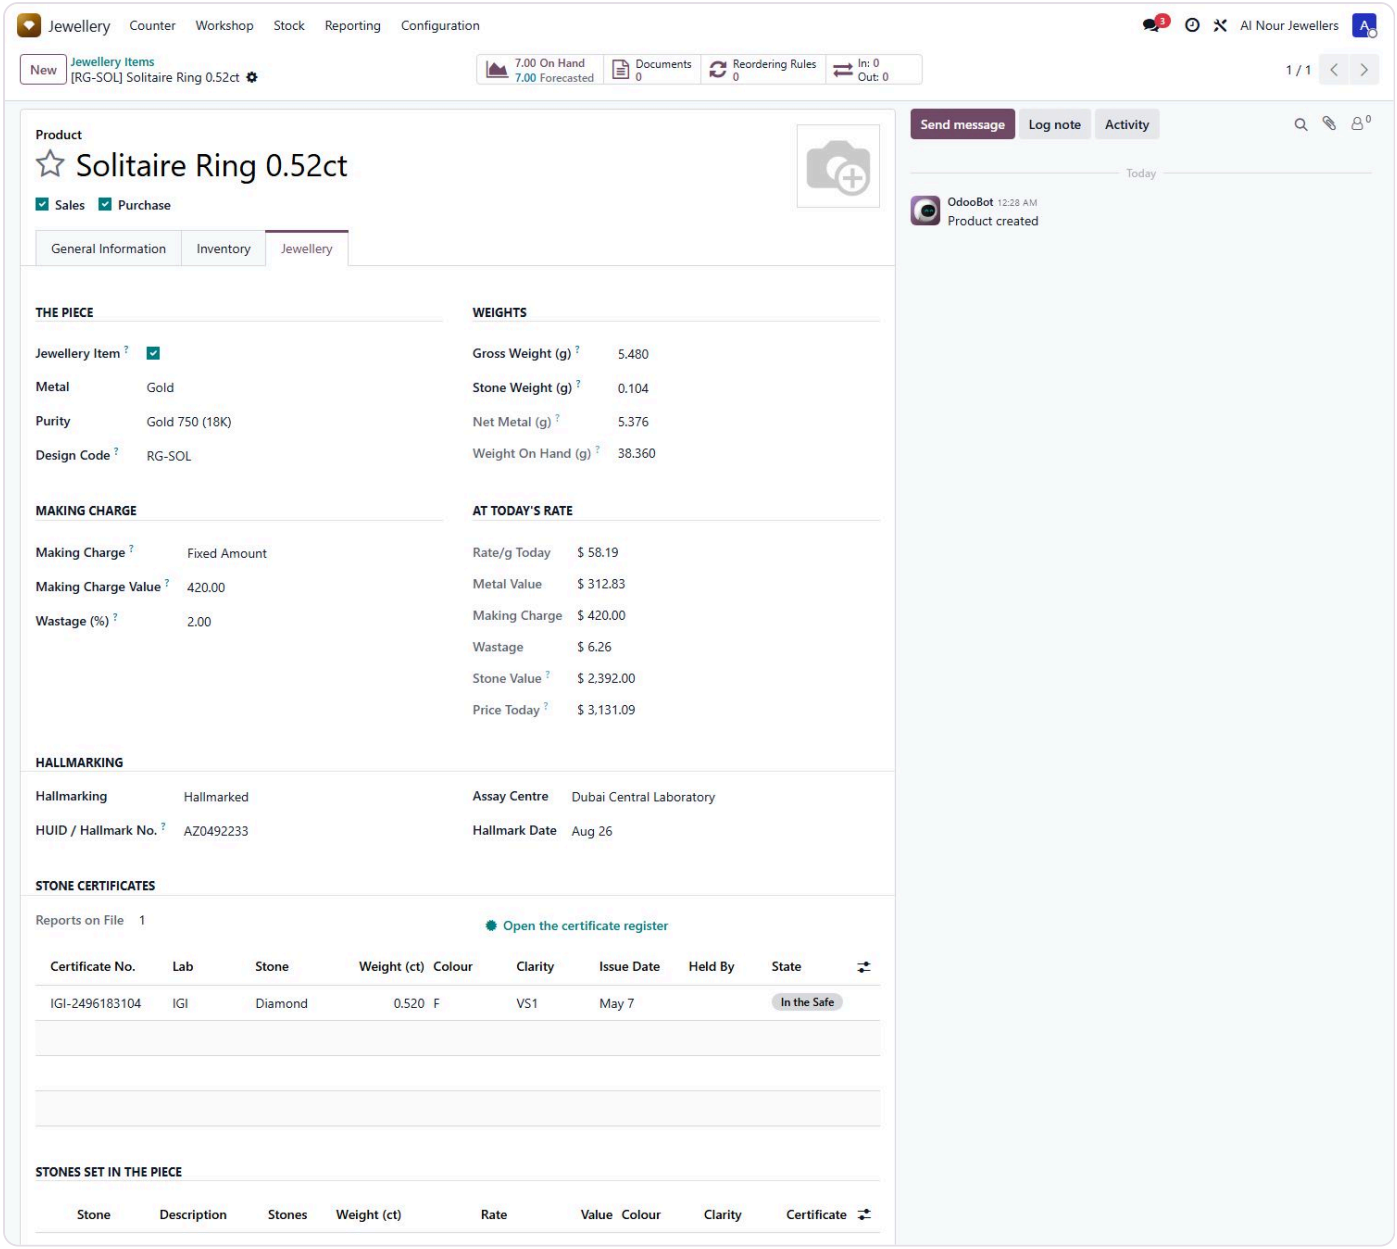

The **HUID** is the unique identification number laser marked on the piece by the assay centre. It belongs to one physical piece and can never be on two, which the system enforces. A piece at or above the hallmark weight will not sell without its number recorded, and a piece cannot be marked hallmarked on a standard the assay office does not mark.

Stones and their certificates

A stone piece lists each stone with its carat, colour, clarity, setting and the certificate that came with it. Pave and channel work goes on one line with the stone count and the total weight. A stone above the certificate weight, on a type that needs one, cannot be entered without its lab report, because a large stone sells on its paper as much as on the stone.

The emerald cocktail ring, Jewellery tab. The weights, the live price at today's rate, the hallmark, and the centre emerald with its certificate. The stone value feeds the price alongside the metal.

A diamond solitaire. The stone carries its IGI certificate, with the colour, clarity and cut from the report.

PART 7 Selling at the counter

A counter ticket works the price out for the salesperson so nobody does it on a pad. Pick the customer and the pieces, and each line splits itself into metal, making, wastage and stones at the rate for the day. Then confirm, invoice and print.

IN THIS PART YOU WILL LEARN

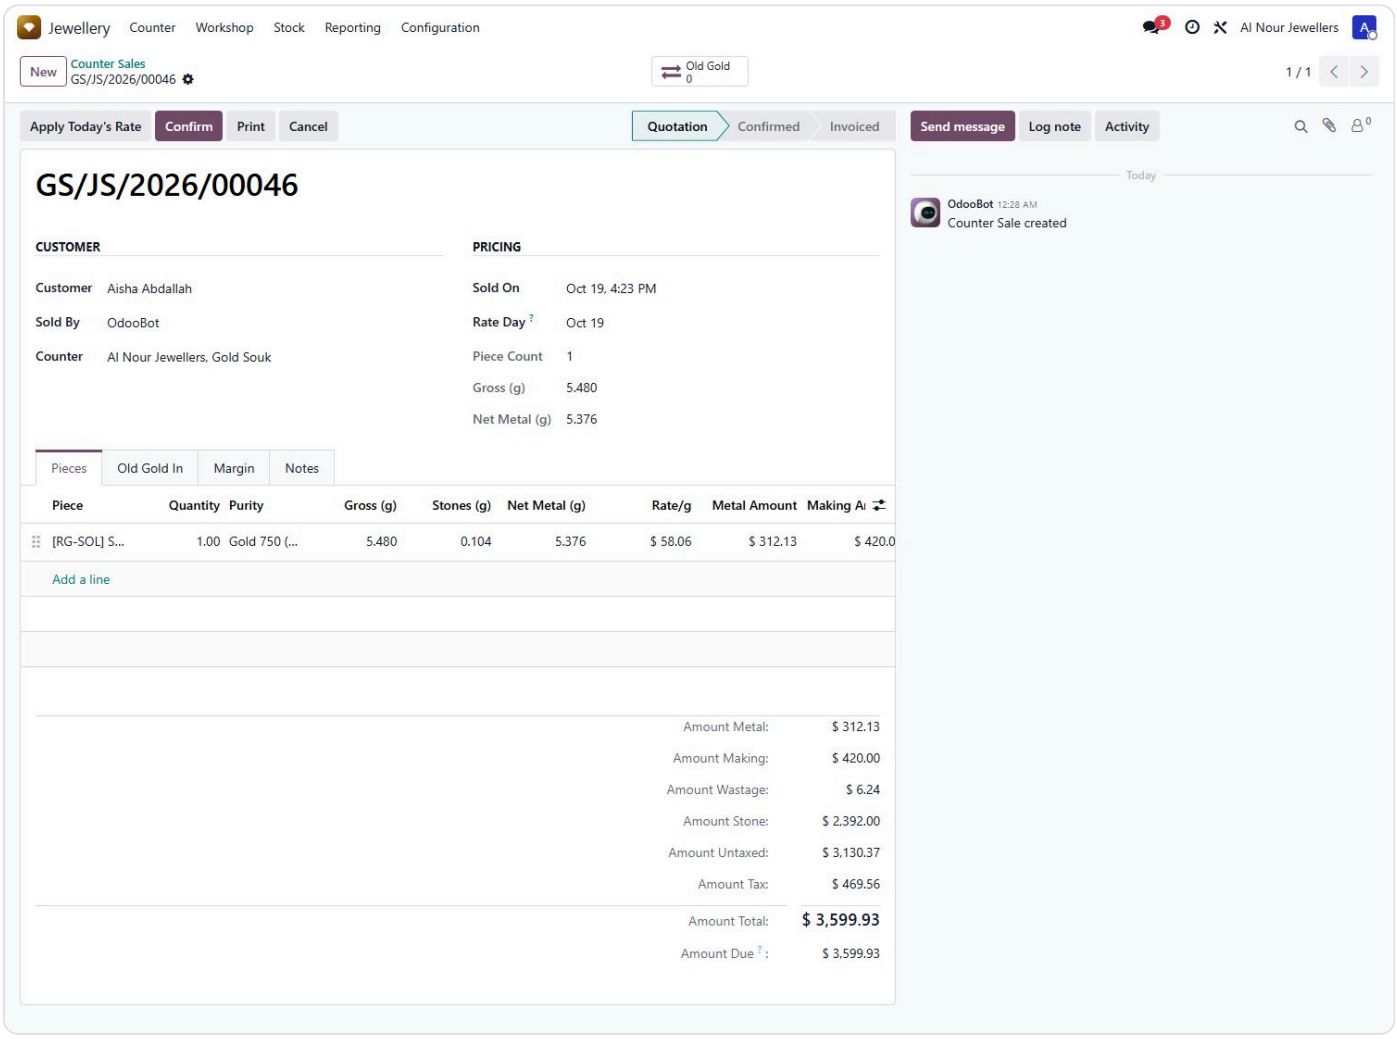

- Raising a ticket, picking the counter, the customer and the rate day
- Adding a piece and reading its metal, making, wastage and stone split
- Weighing a line at the counter and repricing off the rate
- A discount with a reason, and who agreed it
- Confirming, the hallmark check, invoicing and the VAT split

TRY IT YOURSELF ON THE DEMO

1. Open Counter, then Sales, and open a quotation
2. Read the metal, making, wastage and stone totals at the bottom
3. Open an invoiced ticket and follow it through to its invoice

Raise the ticket

Counter, then Sales, then New. Pick the counter, the customer and the rate day, which is almost always today. The ticket number takes the counter's code in front of it, so GS/JS/2026/00048 is a sale raised at the Gold Souk counter. Then add the pieces.

A quotation. Each piece has brought its weight, purity, making charge and wastage off the item, and the rate for the day is stamped on the line. The totals split the ticket into metal, making, wastage and stones.

Each line prices itself

When you pick a piece, the line fills in from it: the metal and purity, the gross and stone weight, the making method and the wastage, and the stone value. The rate for the day is pulled off the table. The counter can still correct any of it, because a bangle is never exactly what the tag says. The weighed figure, not the catalogue figure, is what the customer pays on.

Metal

Net weight times the rate for that purity on the rate day, plus the counter's markup.

Making

Per gram, a percentage of the metal value, or a fixed amount, whichever the piece uses.

Wastage

A percentage of the weight, priced at the same rate.

Stones

Taken from the stones on the piece, and overwritten when a stone is agreed at a different figure.

Reprice off the rate

If the rate moves while a quotation is open, **Apply rate** repulls every line off the table for the rate day. Once a ticket is confirmed the rate is fixed, because the customer has agreed the price and the rate should not move underneath it.

A discount needs a reason

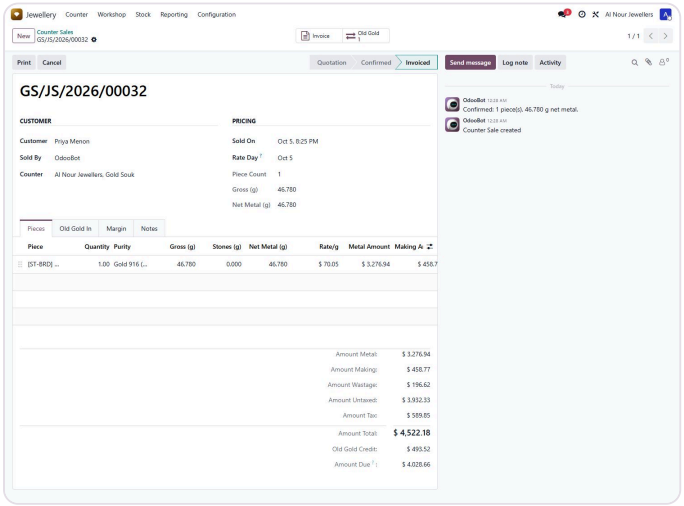

A jeweller trims the making charge for a regular. Record the discount with a reason and who agreed it, because next year nobody remembers. A ticket cannot be confirmed with a discount on it and the reason left blank.

Confirm, and the hallmark check

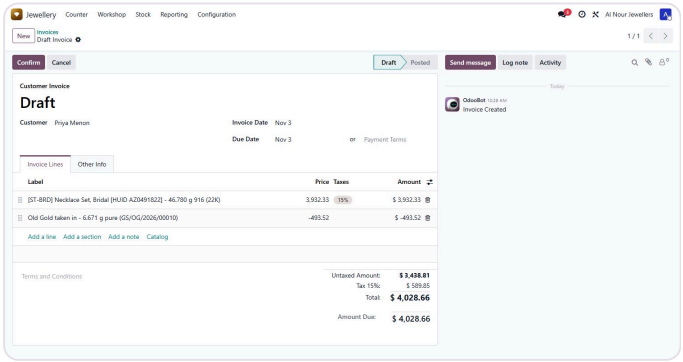

Confirming checks every line has a rate, that any old gold on the ticket has been accepted or rejected, and that no piece heavy enough to need hallmarking is going out without its HUID. A piece over the hallmark weight with no number recorded stops the sale, because above that weight the buyer is entitled to the number.

Invoice, and the VAT split

Invoicing raises a proper Odoo invoice from the ticket, using the same taxes the line showed, so the customer is never billed a figure they did not agree. When VAT is set on the making charge only, the invoice splits into an untaxed metal and stone line and a taxed making charge line, which is the tax base the authority expects to see.

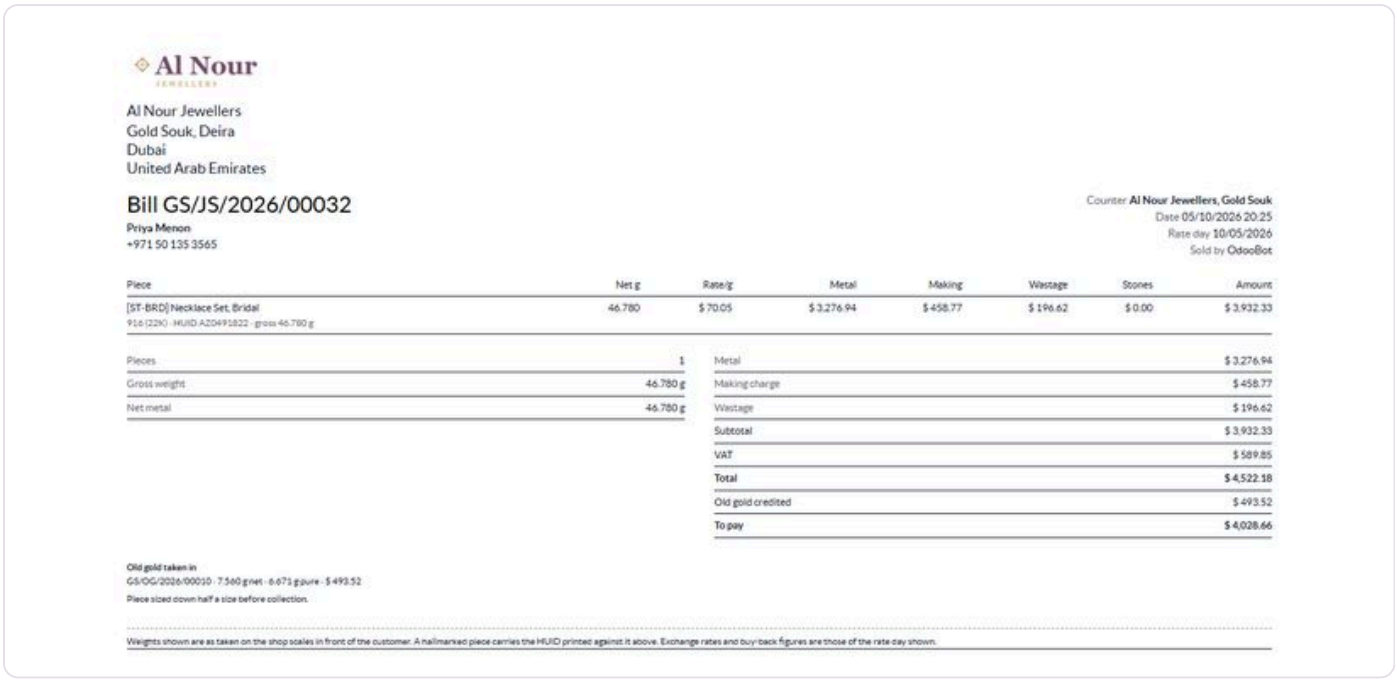

An invoiced ticket. The link to its invoice sits on the ticket, and the state has moved to Invoiced.

The invoice it raised. Metal and making are on separate lines so the tax base is the making charge, not the gold.

Print the bill

The estimate doubles as the bill. It shows the piece, its weight and purity, the split into metal, making and stones, any old gold credited the other way, and what is left to pay.

Piece sized down half a size before collection.

Weights shown are as taken on the shop scales in front of the customer. A hallmarked piece carries the HUID printed against it above. Exchange rates and buy-back figures are those of the rate day shown.

The printed estimate and bill, on an A5 slip that fits a jewellery counter.

PART 8 Old gold and buy-back

Old gold comes back over the same counter. What matters is that the credit is worked out on what the test says, never on what the piece is stamped, and that a gap between the two is written down before the customer is paid.

IN THIS PART YOU WILL LEARN

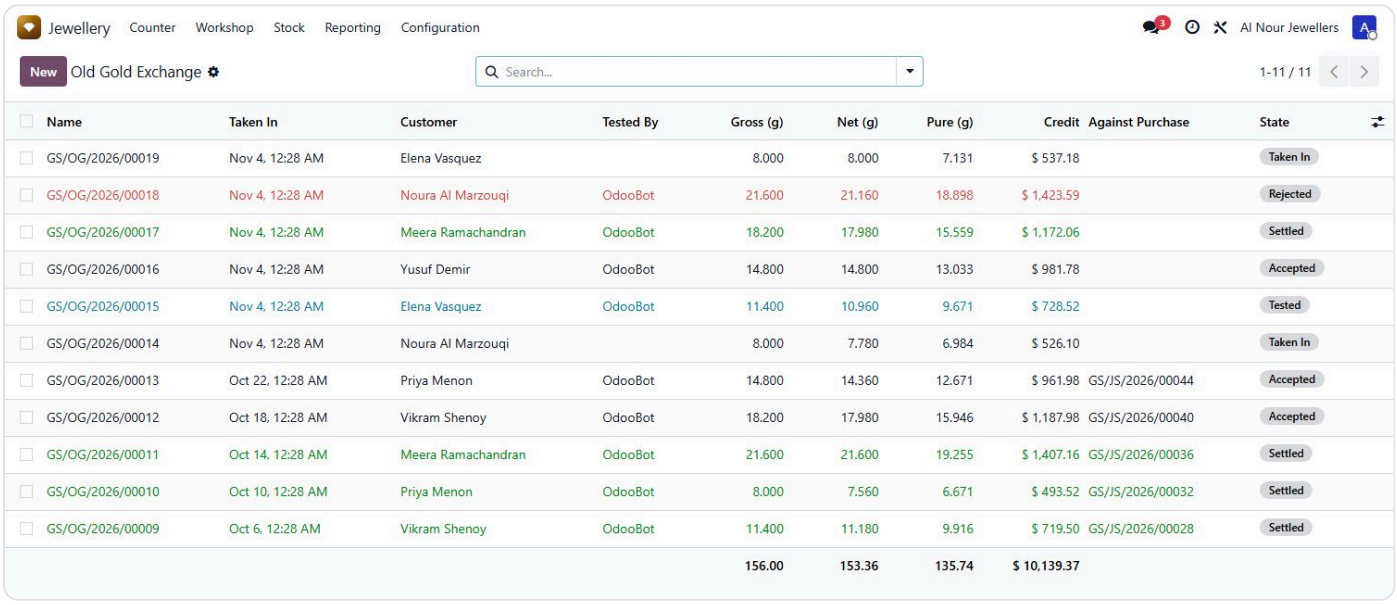

- Taking in old gold and recording what was handed over
- The purity test, the method used, and the impurity deduction
- Pure weight, the buy-back rate, and the credit it works out to
- The gap between the claimed and the tested purity, and the note it needs
- Settling against a purchase, in cash, as store credit or a credit note

TRY IT YOURSELF ON THE DEMO

1. Open Counter, then Old Gold Exchange, and open a settled buy-back
2. Read the gross weight, the tested fineness and the pure weight
3. See how the credit is worked out from the pure weight, not the gross

Take it in

Counter, then Old Gold Exchange. Record what the customer put on the counter in words they would recognise on the receipt, the metal, the gross weight, and anything set into it that is not metal. The claimed purity is what the customer says or what the piece is stamped. It is not what the credit is worked out from.

Name	Taken In	Customer	Tested By	Gross (g)	Net (g)	Pure (g)	Credit	Against Purchase	State

				156.00	153.36	135.74	$ 10,139.37		

Buy-backs at every stage: taken in, tested, accepted, settled or turned away.

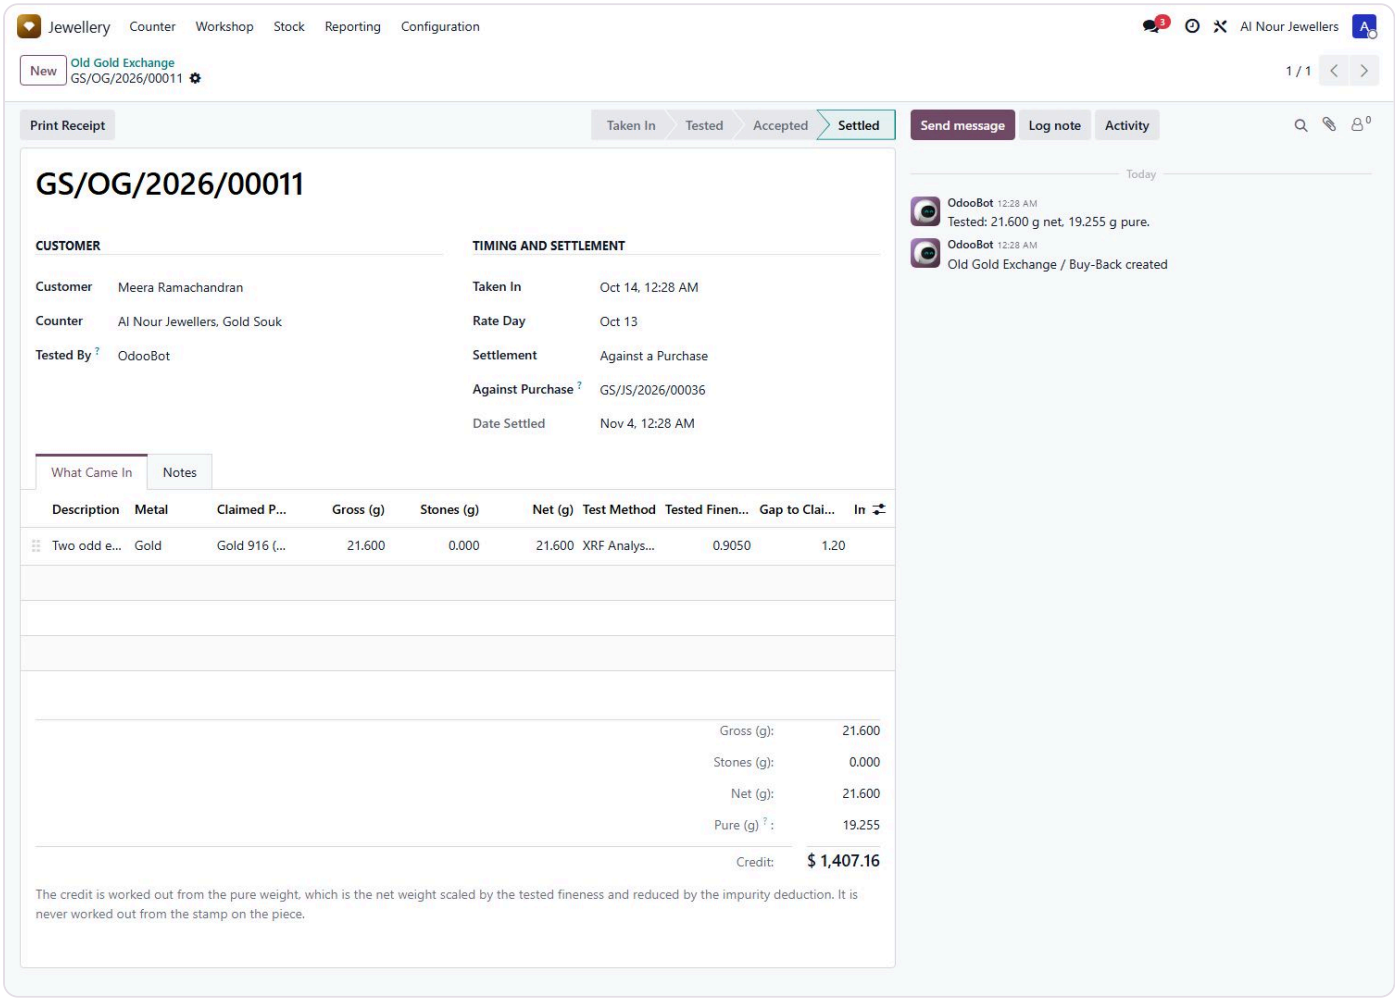

Test it

Record the test method, from a touchstone reading to a fire assay, and the fineness it actually gave. An impurity deduction comes off for solder at the joints, plating and dirt that the test does not see. Every shop takes something off here, and every shop should be able to say how much.

HOW IT WORKS

How the credit is worked out

Gross weight	what the customer brought in
− Stones	anything that is not metal
× Tested fineness	what the test gave, not the stamp
− Impurity deduction	solder, plating, dirt
= Pure weight	**the metal the credit is worked out from**
× Buy-back rate	the fine rate less the metal's buy-back margin
= Credit	**what the shop pays, or takes off a purchase**

A buy-back, tested and settled. The pure weight, not the weight on the scales, is what the credit rests on.

Mind the gap

When the test comes out far from what the customer claimed, beyond the gap you set in the settings, the appraiser has to write down what the test showed before the exchange is accepted. A customer brings in gold they call 22K and the test says 20K: that is the conversation nobody enjoys, so it is recorded with a name against it.

Settle it

A buy-back settles one of four ways: against a purchase on the same visit, paid in cash, as store credit, or as a credit note. When it goes against a purchase, the credit comes off what the customer pays. A straight walk-in buy-back with nothing bought in return is settled on its own, and the printed receipt is the record the customer leaves with.

Settled	Against a Purchase

Customer

For the shop

The credit above is worked out from the tested fineness, not from the stamp on the piece. Weighing and testing were done in front of the customer.

The old gold receipt: what came in, what the test gave, the pure weight and the credit.

PART 9 Repairs and custom orders

The hard part of a repair is not the labour, it is the gold. A customer hands over an old bangle to be melted into a new one and expects the same metal back in a different shape. What went to the bench and what came back has to add up, and where it does not, somebody has to say why.

IN THIS PART YOU WILL LEARN

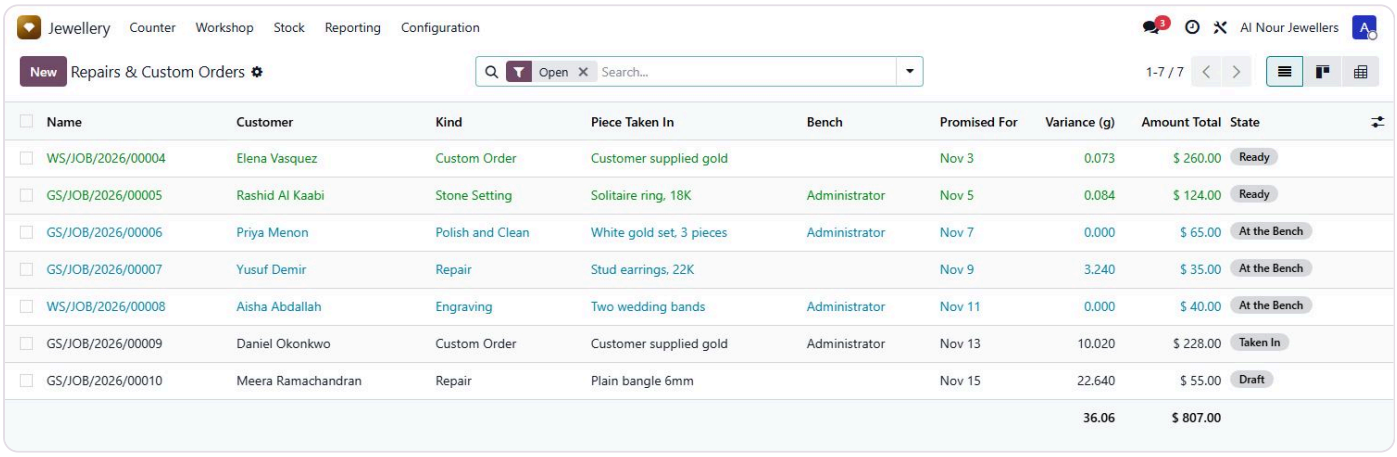

- Taking in a repair or a custom order and what the customer wants
- The customer's metal in, the shop's metal added, and the promised date
- Sending it to a bench or an outside goldsmith
- The metal reconciled: in and added against out and scrap
- Marking it ready, handing it back, and billing labour and materials

TRY IT YOURSELF ON THE DEMO

1. Open Workshop, then Repairs and Custom Orders, and open a delivered job
2. Read the metal in, metal out and the variance it reconciled to
3. Open My Bench to see the jobs assigned to the signed-in goldsmith

Take it in

Workshop, then Repairs and Custom Orders. Record what is wanted in the customer's own words, because a job card that says only 'repair' is the one that comes back wrong. Weigh the customer's own metal in front of them, set the date they were told, and take an advance if it is a custom order, which is almost always half up front.

Name	Customer	Kind	Piece Taken In	Bench	Promised For	Variance (g)	Amount Total	State
WS/JOB/2026/00004	Elena Vasquez	Custom Order	Customer supplied gold		Nov 3	0.073	$ 260.00	Ready
GS/JOB/2026/00005	Rashid Al Kaabi	Stone Setting	Solitaire ring, 18K	Administrator	Nov 5	0.084	$ 124.00	Ready
GS/JOB/2026/00006	Priya Menon	Polish and Clean	White gold set, 3 pieces	Administrator	Nov 7	0.000	$ 65.00	At the Bench
GS/JOB/2026/00007	Yusuf Demir	Repair	Stud earrings, 22K		Nov 9	3.240	$ 35.00	At the Bench
WS/JOB/2026/00008	Aisha Abdallah	Engraving	Two wedding bands	Administrator	Nov 11	0.000	$ 40.00	At the Bench
GS/JOB/2026/00009	Daniel Okonkwo	Custom Order	Customer supplied gold	Administrator	Nov 13	10.020	$ 228.00	Taken In
GS/JOB/2026/00010	Meera Ramachandran	Repair	Plain bangle 6mm		Nov 15	22.640	$ 55.00	Draft
						36.06	$ 807.00	

The workshop board, sorted by the date each job was promised for, so the one due first is at the top.

Send it to the bench

Metal does not leave the counter until a bench or an outside goldsmith is named on the card. A goldsmith sees only the jobs assigned to them. Work can go to your own bench or out to a karigar.

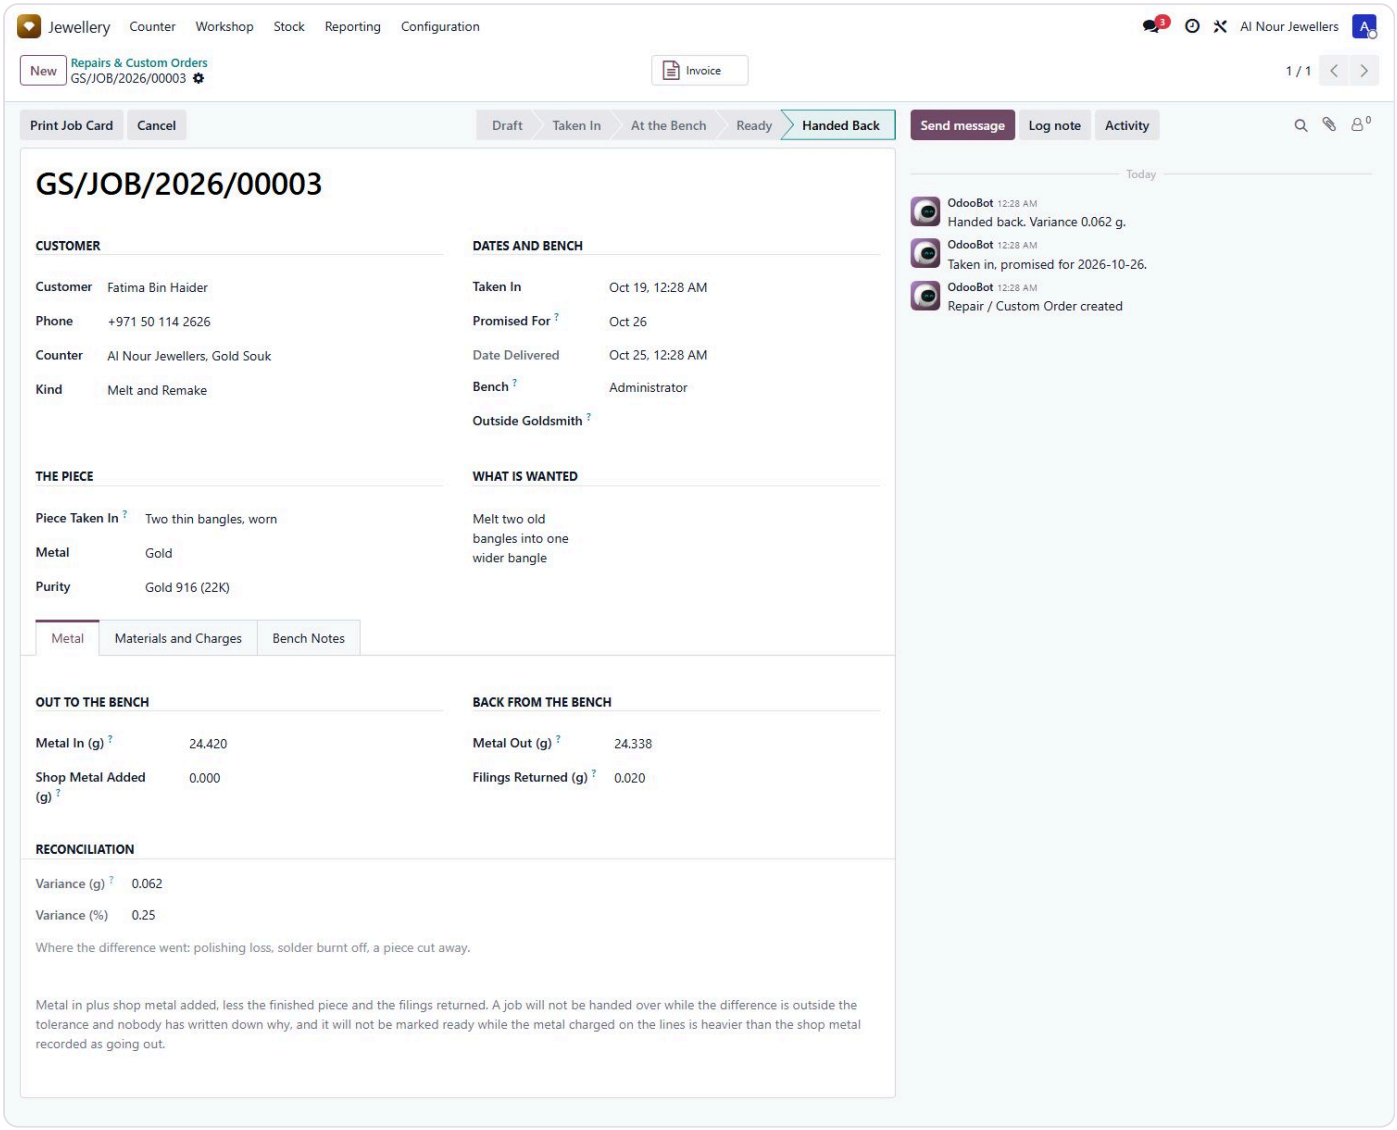

The metal has to add up

This is the whole point of the job card. The metal that went to the bench is the customer's metal in plus any shop metal added. What came back is the finished piece plus the filings returned. The difference is the variance, and a job will not be handed over while the variance is past tolerance and nobody has written down where the metal went.

HOW IT WORKS

The metal balance on every job

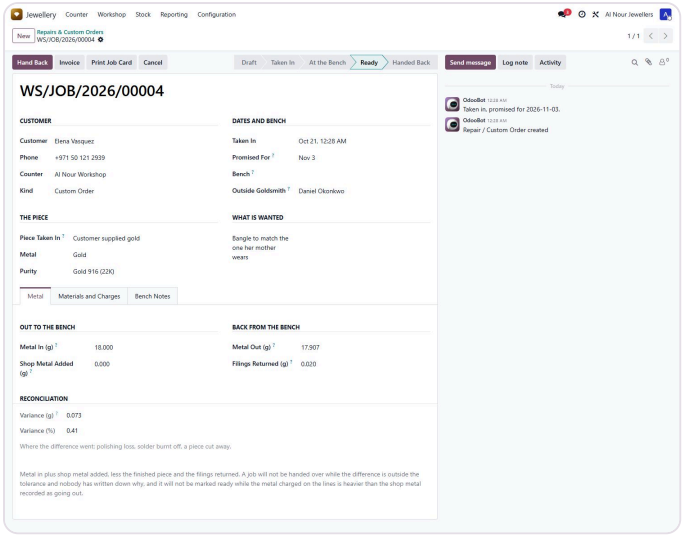

Metal in	the customer's own metal, weighed at the counter
+ Shop metal added	metal from the shop worked into the piece
− Metal out	what the finished piece weighs back
− Filings returned	dust and offcuts handed back
= Variance	**positive means metal is missing, and needs a reason**

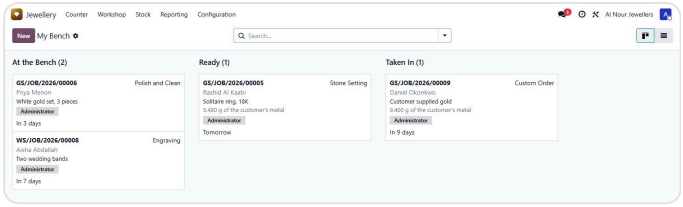

A delivered job. The metal in and added are reconciled against the metal out and the filings, and the small variance is the polishing loss, written down.

Ready, and handed back

When the piece comes back from the bench it is weighed and marked ready, which checks the metal added on the lines matches what was recorded as shop metal. The customer is told. Handing it over records the variance for good and bills the labour and any materials, less the advance already taken.

A job marked ready, waiting for the customer to collect. A nightly reminder chases the ones sitting in the drawer.

My Bench: the jobs assigned to the goldsmith who is signed in, and nothing else.

The printed job card that goes to the bench with the piece, carrying the weights it has to be reconciled against.

PART 10 Approval and memo issue

Stock leaves the shop without being sold more often than an owner would like: home on approval with a customer, out in a salesman's bag on a memo, or to an exhibition. Every piece that goes out is listed with its weight and its value on the day it left, and signed for.

IN THIS PART YOU WILL LEARN

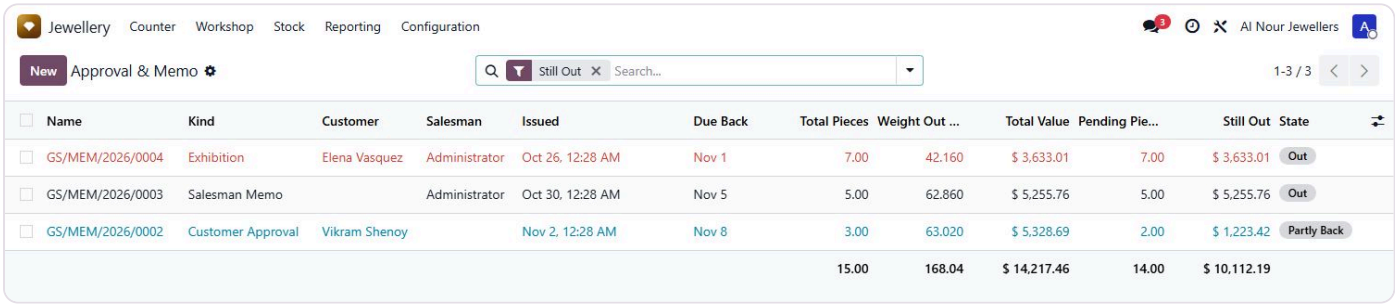

- The four kinds of issue and who holds the goods on each
- The value stamped on a memo so it cannot be argued later
- The value limit above which a manager has to let the goods out
- Partly back, and turning the kept pieces into a sale
- Closing a memo, and how overdue ones are chased

TRY IT YOURSELF ON THE DEMO

1. Open Stock, then Approval and Memo, and open one that is Out
2. Read the pieces out, the weight out and the value signed for
3. See what has come back, what sold and what is still out, on the front

Let the goods out

Stock, then Approval and Memo. Pick the kind: customer approval, a salesman memo, an exhibition, or out to the workshop. Goods on approval go out with a named customer, a salesman memo with a named salesman. List the pieces, and when they leave, the weight and the value at that day's rate are stamped on, so the figure the memo is signed against does not move with the market afterwards.

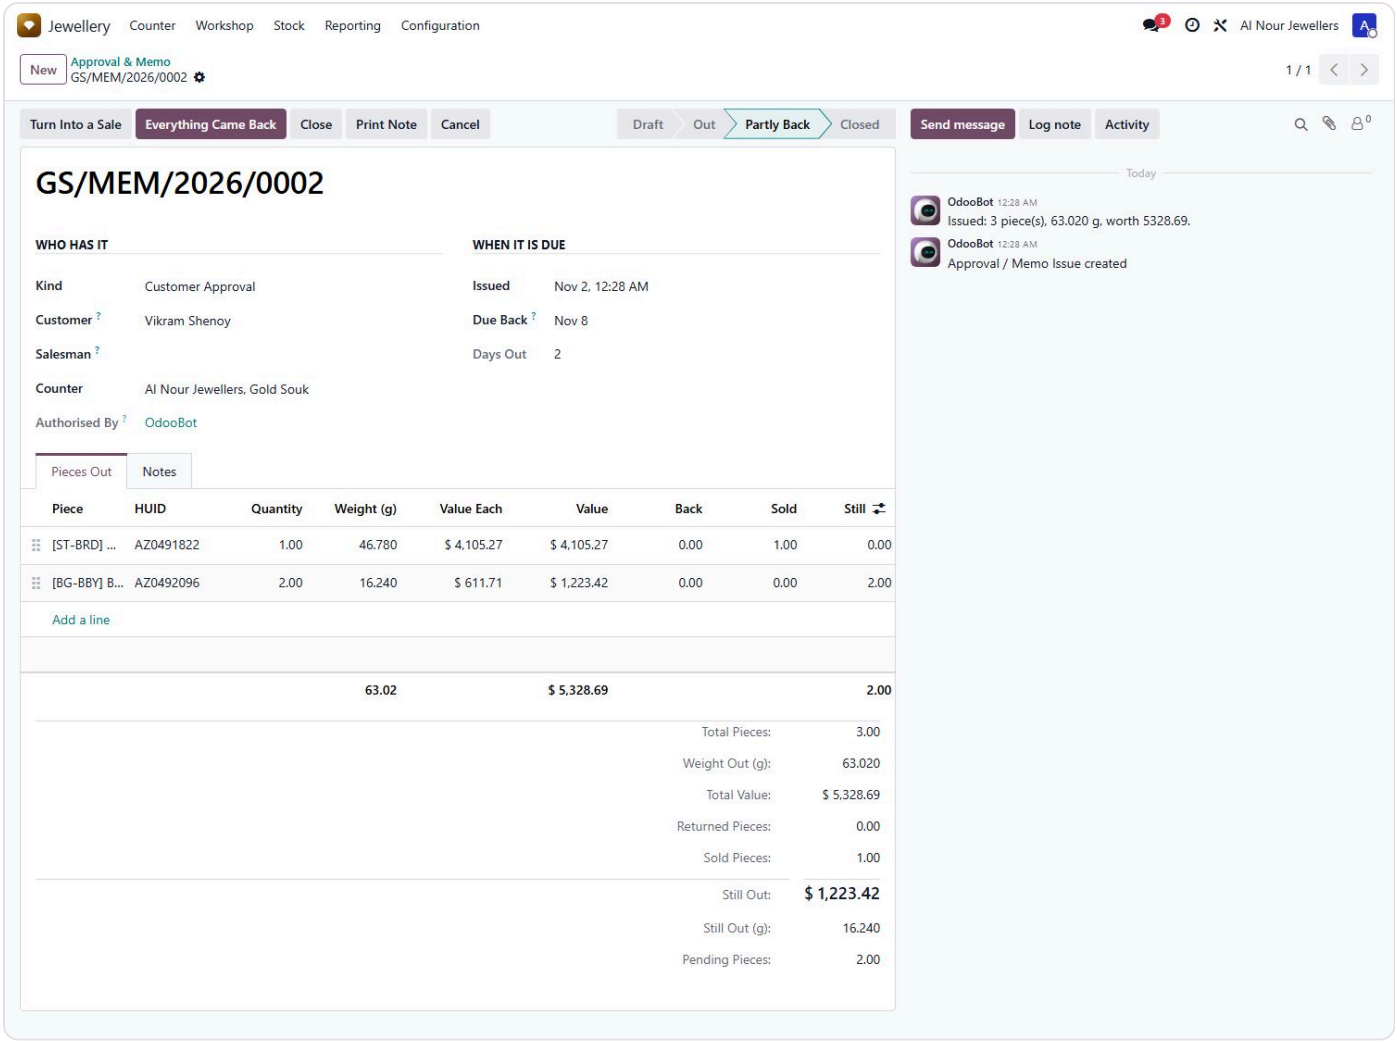

Name	Kind	Customer	Salesman	Issued	Due Back	Total Pieces	Weight Out ...	Total Value	Pending Pie...	Still Out	State
GS/MEM/2026/0004	Exhibition	Elena Vasquez	Administrator	Oct 26, 12:28 AM	Nov 1	7.00	42.160	$ 3,633.01	7.00	$ 3,633.01	Out
GS/MEM/2026/0003	Salesman Memo		Administrator	Oct 30, 12:28 AM	Nov 5	5.00	62.860	$ 5,255.76	5.00	$ 5,255.76	Out
GS/MEM/2026/0002	Customer Approval	Vikram Shenoy		Nov 2, 12:28 AM	Nov 8	3.00	63.020	$ 5,328.69	2.00	$ 1,223.42	Partly Back
						15.00	168.04	$ 14,217.46	14.00	$ 10,112.19	

The memo book, sorted by the date each is due back. Anything past its date and still out is chased.

A big memo needs a manager

Above the value limit set in the settings, only a manager can let the goods out, and the manager's name is stamped against the decision. The limit sits on the write itself, not just behind the button, so an import or an outside call cannot walk a valuable tray out of the shop unapproved.

A memo out with a customer. The front shows the pieces out, the weight and value signed for, and what has come back, what has sold and what is still out.

Back, sold, or still out

As pieces come back or sell, the memo moves to partly back and shows the three figures at a glance. The pieces a customer keeps become a counter ticket in one step, carrying the weights and the customer across. A memo cannot be closed while anything on it is still unaccounted for, because an open piece is how stock disappears.

PART 11 Stock count by weight

A jeweller counts the tray in pieces and in grams. The count sheet takes the book quantity and the book weight, records what was actually on the tray, and prices the difference at today's rate. A line outside tolerance needs a reason before the count can close.

IN THIS PART YOU WILL LEARN

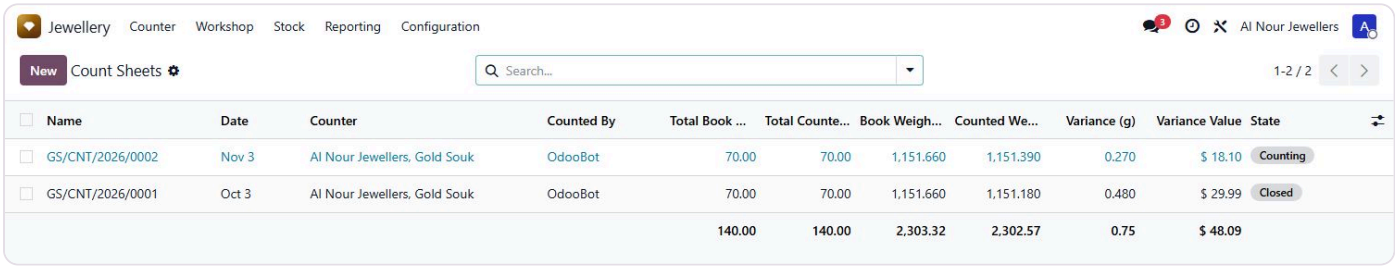

- Starting a count and pulling the book figures off the shelf
- Counting pieces and weight against the book
- The variance in grams, priced at today's rate
- The tolerance, and the reason an out-of-tolerance line needs
- Closing the count as the record that nothing has walked out

TRY IT YOURSELF ON THE DEMO

1. Open Stock, then Count Sheets, and open a closed count
2. Read the book weight, the counted weight and the variance
3. See the value put on the gap at today's rate

Start the count

Stock, then Count Sheets, then New, then Start. The sheet reads the book quantity and the book weight for every jewellery piece in the counter's location, and hands somebody the tray to count against it.

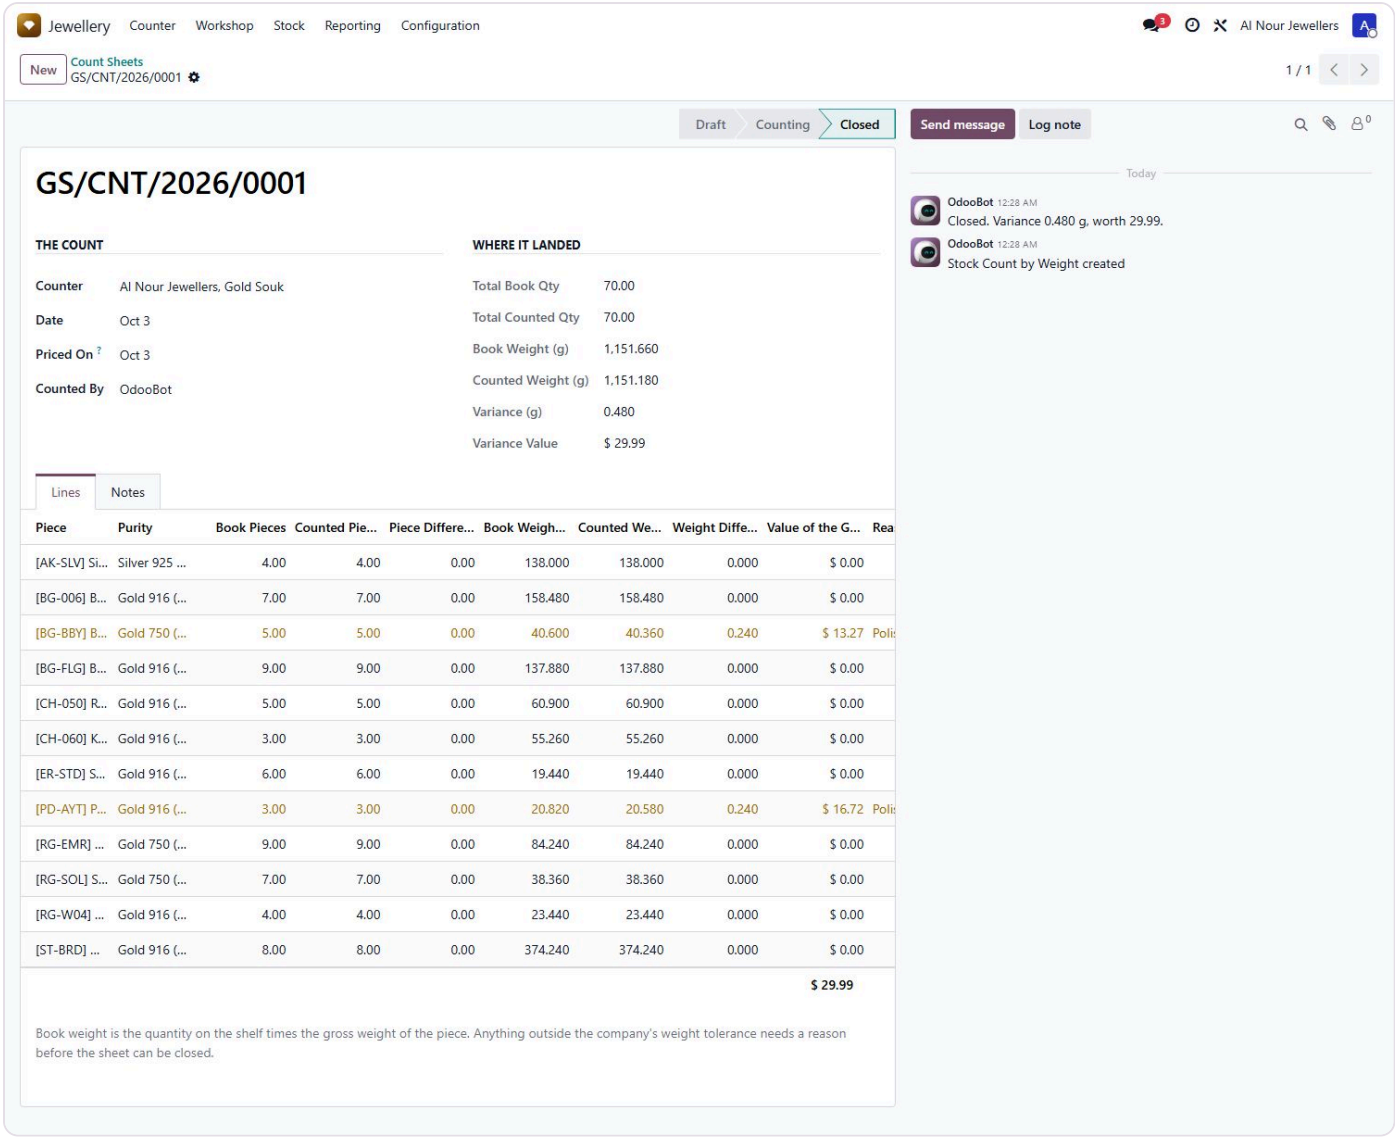

Name	Date	Counter	Counted By	Total Book ...	Total Counte...	Book Weigh...	Counted We...	Variance (g)	Variance Value	State
GS/CNT/2026/0002	Nov 3	Al Nour Jewellers, Gold Souk	OdooBot	70.00	70.00	1,151.660	1,151.390	0.270	$ 18.10	Counting
GS/CNT/2026/0001	Oct 3	Al Nour Jewellers, Gold Souk	OdooBot	70.00	70.00	1,151.660	1,151.180	0.480	$ 29.99	Closed
				140.00	140.00	2,303.32	2,302.57	0.75	$ 48.09	

Count sheets: one closed last month, one being counted this morning.

Count and price the gap

Enter what was actually on the tray. The variance is the book weight less the counted weight, and it is priced at the rate for the day, because a missing gram is worth what gold is worth now, not what it cost. A line outside the weight tolerance has to carry a reason, polishing loss, a piece out on memo that was missed, a sale not yet posted, before the count can be closed.

A closed count. Each line shows book against counted, the weight difference and the value put on it. The reconciled sheet is the record that proves nothing has walked out of the shop.

PART 12 The stone certificate register

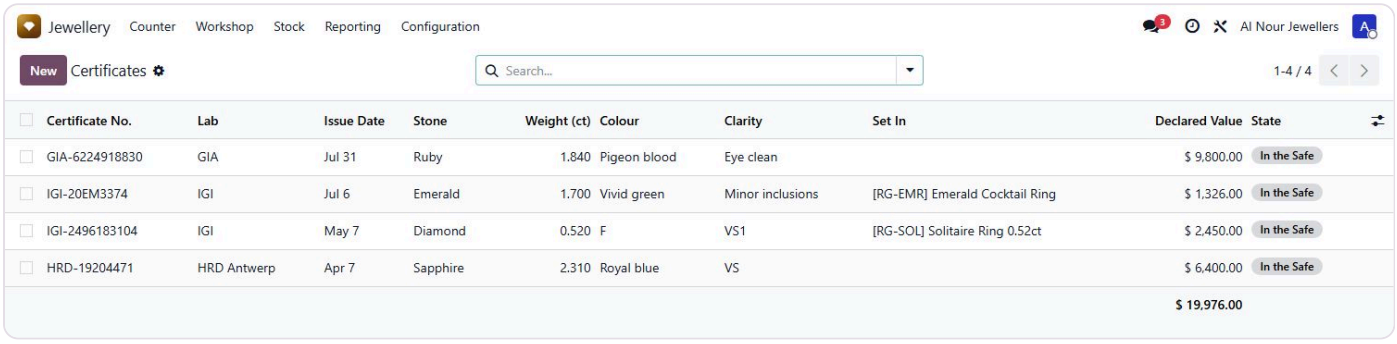

The resale value of a large stone rests on its paper. The register records every lab report that comes into the shop and, just as important, who is physically holding it now.

IN THIS PART YOU WILL LEARN

- Registering a certificate from GIA, IGI, HRD and the rest
- The grading it carries, and the piece it is set in
- In the safe, out with a customer, back in the safe, or void
- Why a certificate handed over and never recorded is the one that is lost

The register

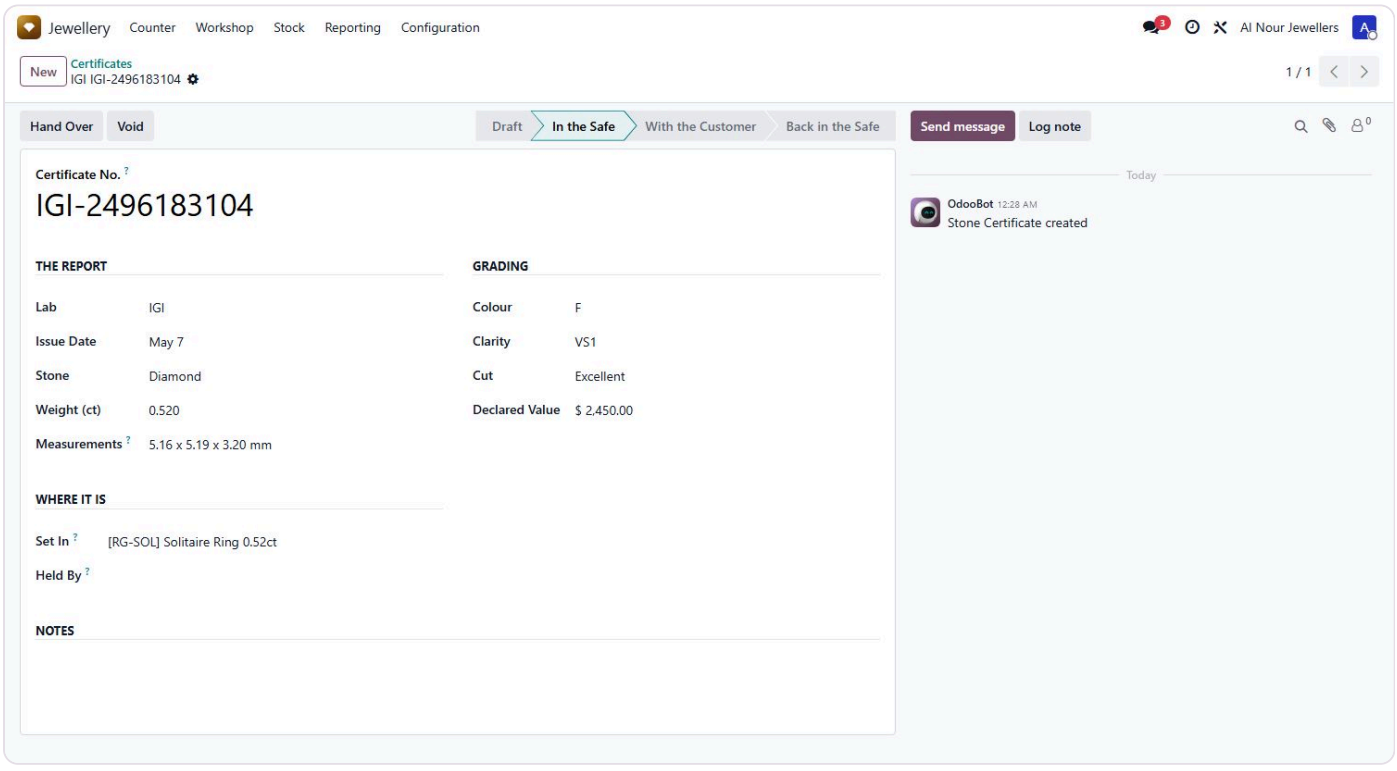

Stock, then Stone Certificates. Each report is recorded with its number, the lab, the stone, its weight and grading, and the piece it is set in, or none if it is still a loose stone. The number printed on the report is the key, because it is what a buyer will quote back at you years later.

Certificate No.	Lab	Issue Date	Stone	Weight (ct)	Colour	Clarity	Set In	Declared Value	State
GIA-6224918830	GIA	Jul 31	Ruby	1.840	Pigeon blood	Eye clean		$ 9,800.00	In the Safe
IGI-20EM3374	IGI	Jul 6	Emerald	1.700	Vivid green	Minor inclusions	[RG-EMR] Emerald Cocktail Ring	$ 1,326.00	In the Safe
IGI-2496183104	IGI	May 7	Diamond	0.520	F	VS1	[RG-SOL] Solitaire Ring 0.52ct	$ 2,450.00	In the Safe
HRD-19204471	HRD Antwerp	Apr 7	Sapphire	2.310	Royal blue	VS		$ 6,400.00	In the Safe
								$ 19,976.00	

The certificate register. A report out with a customer is flagged, so the paper and the piece do not drift apart.

A certificate moves through the safe, out with a customer, and back in the safe, with a name against it at every step. It cannot be voided while it is out with somebody, and voiding one needs a reason, because a gap on the register is what an auditor asks about first.

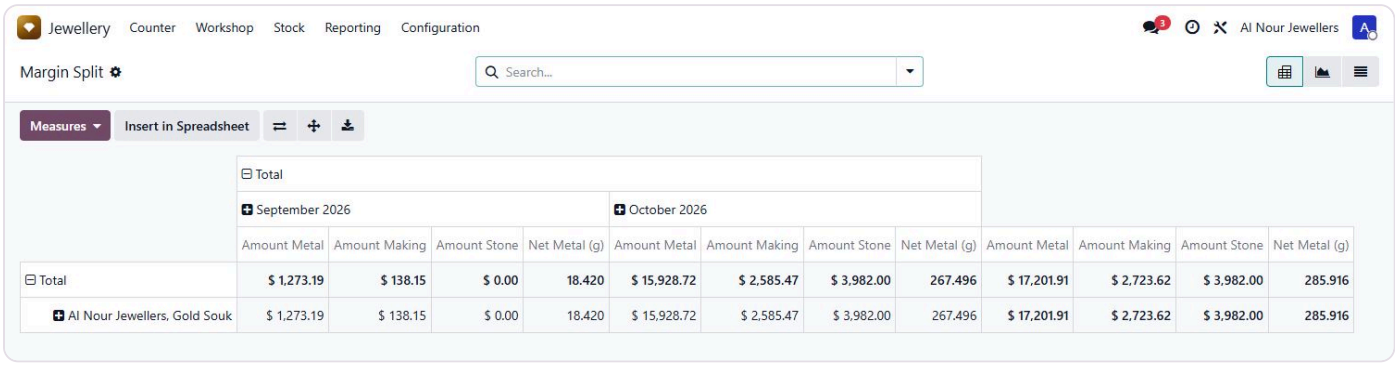

A certificate set in a piece, with its lab, grading and where it is held.

PART 13 Reporting

Four reports answer the questions an owner actually asks: where is my margin coming from, what is my stock worth by weight, and does the metal that went to the bench match what came back.

Margin split

Every ticket with its metal, making, wastage and stones kept apart, and the margin on each. It shows at a glance that the money is made on the making charge and the stones, not on the metal, which is passed through close to cost.

	Total				September 2026				October 2026			
	Amount Metal	Amount Making	Amount Stone	Net Metal (g)	Amount Metal	Amount Making	Amount Stone	Net Metal (g)	Amount Metal	Amount Making	Amount Stone	Net Metal (g)
Total	$ 1,273.19	$ 138.15	$ 0.00	18.420	$ 15,928.72	$ 2,585.47	$ 3,982.00	267.496	$ 17,201.91	$ 2,723.62	$ 3,982.00	285.916
Al Nour Jewellers, Gold Souk	$ 1,273.19	$ 138.15	$ 0.00	18.420	$ 15,928.72	$ 2,585.47	$ 3,982.00	267.496	$ 17,201.91	$ 2,723.62	$ 3,982.00	285.916

Margin split by ticket, with cost and margin for the manager, who is the only one who sees them.

Metal, making and stones

Every sale line, which you can group and total any way you ask, by metal, by purity, by counter or by salesperson, to see where the weight and the making revenue are coming from.

	Total					September 2026					October 2026				
	Metal Amount	Making Amount	Wastage Amount	Stone Value	Net Metal (g)	Metal Amount	Making Amount	Wastage Amount	Stone Value	Net Metal (g)	Metal Amount	Making Amount	Wastage Amou
Total	$ 1,273.19	$ 138.15	$ 38.20	$ 0.00	18.420	$ 29,405.39	$ 4,428.47	$ 1,279.19	$ 3,982.00	461.196	$ 30,678.58	$ 4,566.62	$ 1,317.
Gold 916 (22K)	$ 1,273.19	$ 138.15	$ 38.20	$ 0.00	18.420	$ 25,718.92	$ 3,249.89	$ 1,143.72	$ 0.00	363.580	$ 26,992.11	$ 3,388.04	$ 1,181.
Gold 750 (18K)						$ 3,655.42	$ 1,147.53	$ 134.85	$ 3,982.00	63.116	$ 3,655.42	$ 1,147.53	$ 134.
Silver 925 Sterling						$ 31.05	$ 31.05	$ 0.62	$ 0.00	34.500	$ 31.05	$ 31.05	$ 0.

Sale lines across the shop, ready to group and total by metal, purity, counter or person.

Stock by weight

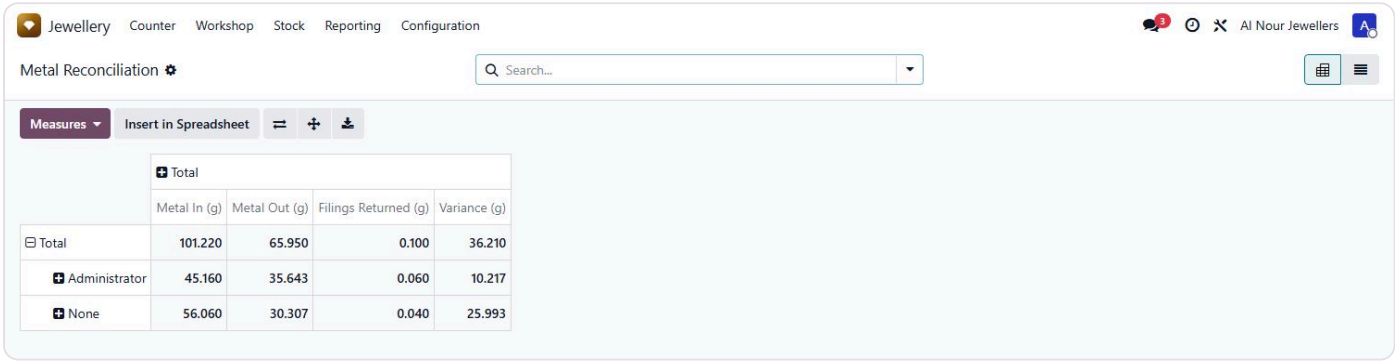

What is on hand, in pieces and in grams, by purity. It is the figure a count sheet is checked against and the one an insurer wants.

Stock on hand by weight, the grams of each purity sitting in the shop.

Metal reconciliation

What went to the bench against what came back, across every job, so a pattern of loss on one bench shows up long before it becomes a number worth worrying about.

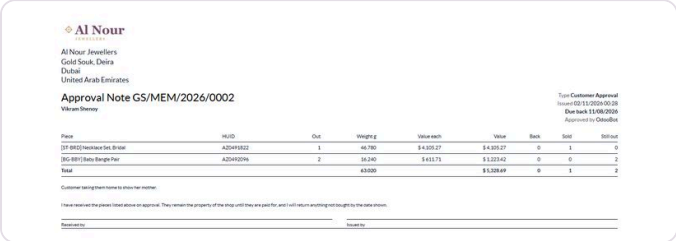

Metal reconciliation across the workshop: issued against returned, and the variance on each job.

PART 14 The printed documents

Everything that crosses the counter can be printed on a slip that fits a jewellery shop. You have met the estimate, the old gold receipt and the job card in their own parts. These are the other two.

DOCUMENT	RAISED FROM	WHAT IT IS FOR
Estimate and bill	A counter sale	The quote and the bill, with the split into metal, making and stones
Old gold receipt	A buy-back	What came in, what the test gave, the pure weight and the credit
Job card	A repair or order	Goes to the bench with the piece, carrying the weights to reconcile
Memo note	An approval or memo	Signed for when goods leave the shop, listing every piece and its value
Count sheet	A stock count	The tray counted against the book, the variance priced and signed

PART 15 A fifteen minute walk-through

If you have the demo open and fifteen minutes, this is the path that shows the whole shop. It is also the order to show a customer in.

#	DO THIS	AND NOTICE
1	Counter, then Rate Board	*One rate feeds every purity. This is what the whole shop prices off.*
2	Stock, then Jewellery Items, open the Emerald Cocktail Ring	*Gross, stone and net weight, and the price built live from today's rate.*
3	On its Jewellery tab, scroll to the stones	*The emerald with its certificate, and the melee diamonds, priced on their own.*
4	Counter, then Sales, open a quotation	*The ticket split into metal, making, wastage and stones.*
5	Open an invoiced ticket, then its invoice	*The invoice splits metal from making so VAT lands on the making charge.*
6	Counter, then Old Gold Exchange, open a settled one	*The credit is worked out on the tested purity, not the stamp.*
7	Workshop, then Repairs, open a delivered job	*Metal in and added, against metal out and filings, reconciled.*
8	Stock, then Approval and Memo, open one that is Out	*Pieces out at a signed value, and what is still out.*
9	Stock, then Count Sheets, open a closed one	*The tray weighed against the book, the gap priced at today's rate.*
10	Reporting, then Margin Split	*The money is in the making and the stones, not the metal.*

Questions people ask

QUESTION	ANSWER
Does it work for silver and platinum, not just gold?	Yes. Each metal has its own purities, rate and buy-back margin. Silver and platinum are quoted by fineness.
We are not in the Gulf. Can VAT be on the whole bill?	Yes. VAT on the whole ticket or on the making charge only is one setting, per company.
Can two shops share one system?	Yes. Each company has its own counters, rates, VAT basis and limits, and a shared vault and workshop.
What stops a salesperson giving gold away?	A discount needs a reason and a name. A memo over the limit needs a manager. A piece over the hallmark weight will not sell without its number.
Does it need Odoo Enterprise?	No. It runs on Odoo 19 Community, with Inventory and Accounting, which it installs for you.
Can the goldsmith see the prices and the books?	No. A goldsmith sees only the jobs on their own bench, and nothing on rates, tickets or accounts.

PART 16

The menu map

Every screen in the module, on one page.

Counter

Sales	Every counter ticket, priced off the day rate
Old Gold Exchange	Buy-backs: tested, priced, settled
Rate Board	Each purity and what it works out to today

Workshop

Repairs & Custom Orders	Job cards, the metal reconciled on each
My Bench	The jobs assigned to the goldsmith signed in

Stock

Jewellery Items	The pieces, by weight, purity and making charge
Approval & Memo	Goods out on approval, memo or to an exhibition
Count Sheets	The tray counted by weight against the book
Stone Certificates	Every lab report and who is holding it

Reporting

Margin Split	Metal, making and stones per ticket, with margin
Metal, Making & Stones	Every sale line, grouped any way you ask
Stock by Weight	Pieces and grams on hand by purity
Metal Reconciliation	What went to the bench against what came back

Configuration

Settings	VAT basis, hallmark rule, tolerances, memo limit
Counters	Showrooms, workshop and vault, each with its markup
Metal Rates	The day rate per metal and purity, with history
Metals	Gold, silver, platinum and the buy-back margin
Purity Standards	Karat, fineness, the fine and hallmark flags
Stone Types	Diamond, coloured stones, pearls, certificate rule

Want this for your shop?

We set it up with your metals, purities, counters and the way you price making and wastage, load your stock by weight, connect your accounts and VAT, and train the counter and the bench. The same module runs a single showroom or a chain of counters with a shared vault and workshop.
