COMPLETE GUIDE · INTRODUCTION, SETUP AND EVERY ROLE

Restaurant Suite for Odoo 19

Waiter tablets, kitchen screens, silent printing, delivery riders, call center, online orders, reservations, recipes and stock, loyalty, fiscal receipts and owner reports, for one outlet or a chain. Every screen and every step, shown on a working demo.

DINE-IN | TAKEAWAY | DELIVERY | ONLINE AND PHONE

START

How to read this guide

This is one guide for one product: the **Way4Tech Restaurant Suite for Odoo 19**. The suite is built from separate modules, each doing one job (the kitchen screen, delivery, reservations and so on). A restaurant can install all of them as one suite, or only the ones it needs. Every module plugs into the same Restaurant app, so the staff see one system.

ODOO POS

Standard Odoo 19 Point of Sale. Comes with Odoo, shown because the suite builds on it.

BASE

The free foundation: branches, roles, PIN approvals, audit log, shifts. Always installed.

KITCHEN DISPLAY

A suite module. The tag names the module that brings the feature.

Every section and every step carries the tag of the module it belongs to, so you always know what a restaurant needs to install for that screen. The screenshots come from the full demo: two Lahore branches of **Lahore Grill House**, Gulberg and DHA Phase 6, with a week of real orders.

Who should read what

IF YOU ARE	READ
New to restaurants, or choosing modules	Part 1 (a restaurant day), Part 2 (the modules).
Setting up a new restaurant	Part 4, setup in the order you should do it, then the go-live checklist.
Waiter, cashier or cook	Part 5 (waiter), 6 (tables and bills), 7 (cashier), 8 (kitchen).
Running delivery, online, phone orders or bookings	Parts 9, 10, 11 and 12.
A branch manager or owner	Parts 13 to 17: branches, stock, guests, reports and controls.
Showing the system to someone	Part 19, the 15 minute demo script and the answers to common questions.

PART 16 Reports for the owner and the manager

PART 17 Controls: roles, PINs and the audit log

PART 18 Printers, devices and running without internet

PART 19 The 15 minute demo, and questions customers ask

PART 20 Reference: the menu map and every feature

OVERVIEW

The product at a glance

A restaurant has many moving parts: tables, a kitchen, a till, riders, phones ringing, online orders, bookings, stock and cash. Most restaurants run them on paper and three or four separate apps that do not talk to each other. The Restaurant Suite puts all of it on one Odoo 19 database, live on every screen, for one outlet or a chain of branches.

What it solves

No lost orders

The waiter sends the order from a tablet. It lands on the kitchen screen or printer of the right station in a second, with the table, seat and notes.

A kitchen that keeps time

Every ticket has a timer that turns amber and red. The waiter is told when food is ready. Kitchen times are reported per dish and hour.

Cash that adds up

Every void, discount, price change and refund needs a manager PIN and goes in the audit log. The drawer is counted by note at closing.

Delivery under control

Zones decide the branch and the fee, riders get a phone screen, the cash they bring back is counted and matched.

Every channel in one place

Dine-in, takeaway, the call center, the website, the app and delivery partners all end up as orders on the same till and kitchen.

Guests who come back

Bookings with reminders, a walk-in waitlist, loyalty tiers, birthday offers and a feedback QR on every receipt.

Stock that matches sales

Recipes deduct ingredients on every paid order. Wastage and counts show what went missing, and a reorder list is ready every morning.

One view of all branches

The owner dashboard shows sales, covers, average ticket, best and worst dishes, waiters and payments for one branch or all.

Tax receipts by law

FBR and provincial authorities in Pakistan, ZATCA in Saudi Arabia and UAE VAT receipts, with a QR and a retry queue.

Built and tested

19
modules in one Restaurant app, each also available on its own

807
automated tests, run with every module installed together

3
screen sizes tested on every screen: phone, tablet, desktop

0
Enterprise licences needed: runs on Odoo 19 Community

What it runs on

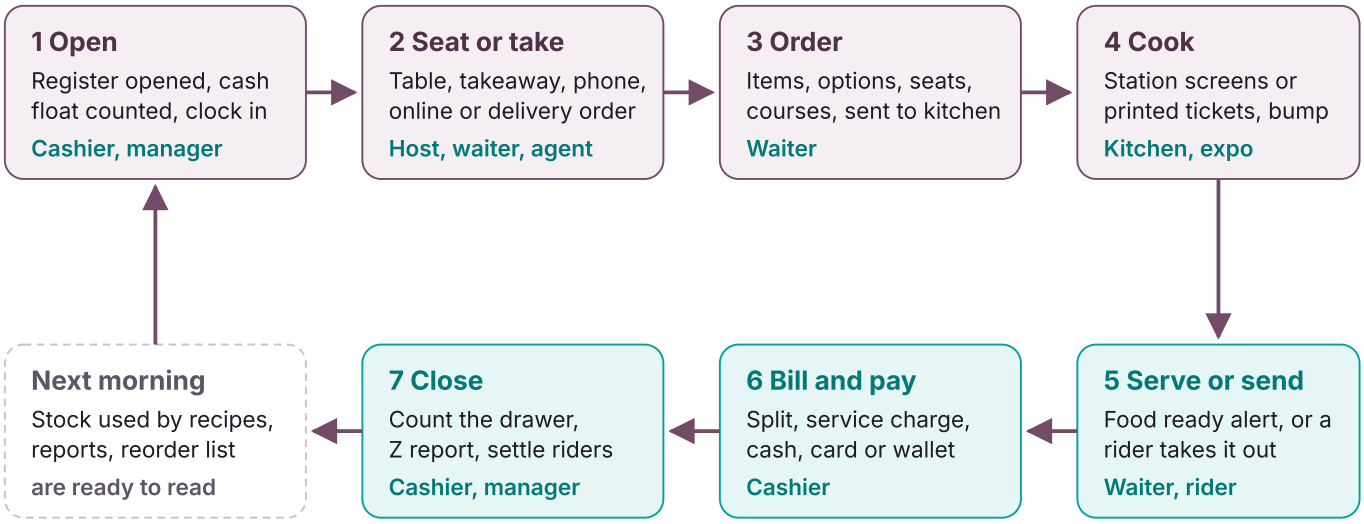

PART	WHAT IS NEEDED
Odoo	Odoo 19, Community or Enterprise, on Odoo.sh, a cloud server, or a small PC inside the restaurant.
Tills and tablets	Any browser: Android or iPad tablets, phones, Windows PCs, touch POS terminals. Installs as an app on the home screen.
Kitchen and riders	A tablet or wall screen in the kitchen (or printers, or both); any smartphone for riders. Tills keep selling when the internet drops (Part 18).
Printers	Network thermal printers (Epson, Xprinter, Bixolon, Star and clones) straight from Odoo, or any Windows printer through the Way4Tech print server. No IoT box.

PART 1 A restaurant day in five minutes

If you have never worked in a restaurant, read this first. Every screen in this guide exists because of one of the moments below. Once you know the day, the system makes sense.

IN THIS PART YOU WILL LEARN

- The eight moments of a restaurant day
- Who does what, and on which device
- The words cooks, waiters and managers use

The people and what they need

Role	What they do	What they use
Owner	Watches sales, costs and staff across every branch.	Dashboard, reports, phone or laptop
Branch manager	Runs one branch: approves voids and discounts, closes the day, orders stock.	Backend, POS with a PIN
Cashier	Takes payments, prints bills, dispatches deliveries, closes the till.	POS on a counter terminal
Waiter	Seats guests, takes orders at the table, sends them to the kitchen. Cannot take payment.	POS on a tablet or phone
Host	Bookings, walk-ins and the waitlist at the door.	Waitlist page in the POS, host stand
Kitchen and expo	Cooks the tickets, bumps them when ready, records wastage.	Kitchen screen or printer
Rider	Takes deliveries out, collects cash at the door.	Phone screen
Call center agent	Takes phone orders for every branch, logs complaints.	Agent console

Ways a restaurant sells

Dine-in

Guests sit at a table. The waiter orders in rounds (drinks, starters, mains) and the bill comes at the end. Parts 5 to 7.

Takeaway

The guest orders at the counter or by phone and collects. Paid first, cooked next.

Delivery

Cooked here, taken by a rider, often paid in cash at the door. Part 9.

Phone orders

A central call center takes orders for every branch and sends each to the right kitchen. Part 11.

Online orders

The restaurant website or app, and partners like Foodpanda, send orders in. Part 10.

Bookings

A table held for a time, with a reminder, or a walk-in queue at the door. Part 12.

Words you will hear

Word	Meaning
Cover	One guest. A table of four is four covers. Sales per cover is a key number.
Fire / send	Send the order (or one course) to the kitchen so they start cooking.
Course	A round of the meal: starters, mains, dessert. A course can be held until the guests are ready.
Station	A part of the kitchen: grill, hot kitchen, bar, pastry. Each gets only its own items.
Expo / pass	The person or screen at the pass who checks every plate before it leaves the kitchen.
Bump	Mark a ticket done on the kitchen screen.
86	Kitchen slang for "sold out". An 86'd dish cannot be ordered until it is back.
Void	Taking a dish off an order after it went to the kitchen. Food may already be cooked, so it needs a manager.
Modifier	A choice on a dish: size, spice level, extra cheese, no onions.
Z report	The end-of-day report that closes the till: sales, payments and the counted cash.
Float	The cash put in the drawer at opening so the cashier can give change.
Food cost %	Ingredient cost of a dish divided by its price. Restaurants aim for about 28 to 35 percent.

PART 2 One app, nineteen modules

The suite is one Restaurant app in Odoo. Underneath, each job is its own module. A small cafe may only need the waiter tablet and the kitchen screen. A chain with delivery and a call center installs everything. The menus, roles and branches are shared, so adding a module later changes nothing that already works.

IN THIS PART YOU WILL LEARN

- What each of the 19 modules adds
- Which modules a cafe, a delivery kitchen and a chain need
- What the suite adds on top of standard Odoo POS

Module	What it adds	Part
BASE	Branches, staff roles, manager PIN approvals, audit log, devices, live table status, clock in and out. Free, always installed.	4
PRINTING	Printing from Odoo to network printers and any Windows printer, job log, reprint, printer health, backup printer.	4.8
MOBILE POS	The POS laid out for phones and tablets: big tiles, bottom bar, favourites, swipe to delete, install as an app.	5
ORDER TAKER	Waiter mode: table board, seats, courses, hold and fire, locked sent lines, food ready alerts.	5
TABLE OPS	Move, merge and split tables, four ways to split a bill, change waiter, service charge, tips by waiter.	6
KITCHEN DISPLAY	Kitchen screens per station, expo, bump and recall, rush, timers, kitchen times report.	8
MENU	Modifier groups with limits, sizes, half and half, timed menus, deals, 86 list, allergens, kitchen names.	4.6
BRANCH TRANSFER	Send an order or stock to another branch, and decide which branch gets the revenue.	13
DELIVERY	Delivery zones, riders, the delivery board, a rider phone screen, rider cash settlement.	9
CALL CENTER	Agent console with caller lookup, branch routing, reorders, complaints, supervisor board, phone system link.	11
ONLINE ORDERS	Online channels (website, app, aggregators) with webhooks, an online orders inbox, menu publishing.	10
RESERVATIONS	Booking calendar, table suggestions, deposits, reminders, the waitlist, guest messages.	12
INVENTORY	Recipes, ingredient consumption on every sale, wastage, stock counts, usage variance, par levels, reorder list.	14
LOYALTY	Tiers on top of Odoo loyalty, tier prices, birthday coupons, QR feedback with alerts on bad ratings.	15
FISCAL	FBR, PRA, SRB, KPRA, ZATCA and UAE VAT receipts, with QR codes and a retry queue.	7
REPORTS	Owner dashboard, menu engineering, X and Z day reports with a cash count, Excel export.	16
WALLET PAYMENTS	JazzCash, EasyPaisa, SadaPay, NayaPay and bank transfer with a reference on every payment, and reconciliation.	7
SUITE	Installs everything, orders the Restaurant menu, and adds the eight-step setup wizard.	4.1

The printing modules come as a pair: **POS Print Anywhere** is the printing engine and also sells on its own for any shop; the **Restaurant Print Bridge** adds kitchen tickets by station, void tickets and delivery slips. Both are shown under the Printing tag.

Which modules fit which restaurant

RESTAURANT	USUALLY INSTALLS
Cafe or small dine-in, one branch	Base, Mobile POS, Order Taker, Table Ops, Kitchen Display or Printing, Menu, Reports
Busy dine-in with a bar	The above, plus Reservations, Loyalty, Inventory, Wallet Payments
Takeaway and delivery	Base, Mobile POS, Kitchen Display, Printing, Menu, Delivery, Online Orders, Reports
Chain of branches with a call center	The full suite
Pakistan, Saudi Arabia or UAE	Add Fiscal for receipts the tax authority accepts

Standard Odoo POS against the suite

Need	Odoo 19 Community POS	With the suite
Branches and branch managers	One company, no branch concept	Branches, each with its tills, kitchen, printers, staff and reports
Waiter that cannot take money	Not available	Waiter role: no Payment button, server refuses payments
Manager approval for voids and discounts	Not available	PIN on voids, price changes, big discounts, refunds, transfers, all audited
Kitchen screen	Enterprise only	Full kitchen display on Community, per station, with expo
Printing without IoT box	Needs an IoT box or ePOS printer	Network printers direct from Odoo, any Windows printer through a small server
Delivery riders and cash	Not available	Zones, riders, board, phone screen, cash settlement
Phone and online orders	Not available	Call center console, webhooks for websites and aggregators
Recipes and food cost	Not available	Recipes deduct ingredients, variance and food cost per dish
Owner dashboard across branches	Basic sales report	Dashboard, menu engineering, X and Z reports with cash count

PART 3 The demo, the logins and the devices

The demo is a restaurant with two branches in Lahore, each with its own register, floor plan, kitchen stations, printers, riders and delivery zones. Log in with any role below to see the system the way that person sees it.

IN THIS PART YOU WILL LEARN

- Who is who in the demo restaurant
- Which login and PIN to use for each role
- Which device each person uses

TRY IT YOURSELF ON THE DEMO

1. Log in as the waiter on a tablet and open the register.
2. Log in as the owner on a laptop and open Restaurant, Reporting, Dashboard.
3. Open the rider login on your phone: Restaurant, Delivery, My Deliveries.

Demo logins

Person	Role	What they see	POS PIN
Faisal Chaudhry	Owner	Every branch, the dashboard, every setting	2580
Ayesha Khan	Branch manager, Gulberg	Gulberg only: approvals, reports, staff, printers, day reports	7410
Sara Malik	Cashier	The POS, orders, deliveries page, print jobs	8520
Bilal Ahmed	Waiter	The table plan on a tablet, own section, waitlist	3690
Usman Tariq	Kitchen	Station screens, tickets, wastage and stock counts	9630
Imran Ali	Rider	My Deliveries on a phone	1590
Hina Qureshi	Call center agent	The agent console, calls, complaints	7530

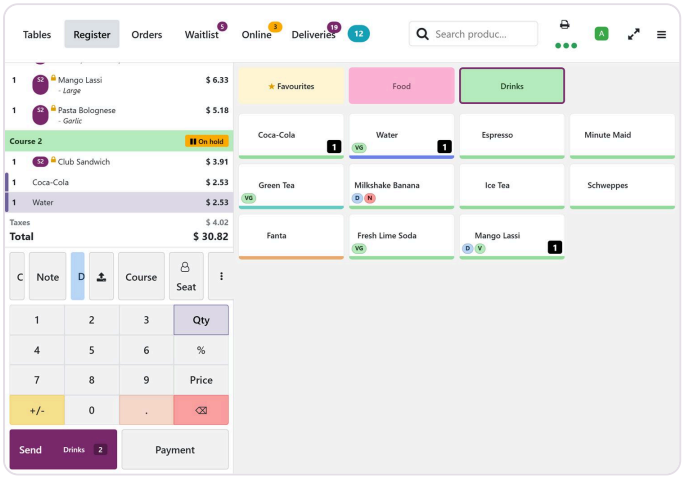

Ask Way4Tech for the demo link and the passwords. The demo you are given never uses an administrator login. A manager PIN is needed in the demo for voids, transfers, big discounts and price changes: use 7410 (Ayesha).

The demo restaurant

	Gulberg	DHA Phase 6
Register	Restaurant Gulberg	Restaurant DHA
Floors	Main Floor and Patio (12 tables each), sections Main Hall and Terrace	DHA Hall, sections Family Hall and Garden
Kitchen stations	Hot Kitchen (food), Bar (drinks), Expo (the pass)	Hot Kitchen, Bar, Expo
Riders	Imran Ali, Shahid Mehmood	Waqar Hussain
Delivery zones	Gulberg 4 km (a circle) and an outer ring	DHA Phase 5 and 6 (a polygon drawn on the map)
Tax	FBR (Pakistan federal) sandbox	ZATCA Phase 1 receipt (to show the Saudi format)

Which device for which person

Role	Phone	Tablet	Desktop
Waiter	Order taker, bottom bar POS	Table plan, order taker, waitlist page	POS
Cashier	POS in phone layout	POS with Online Orders and Deliveries pages	POS, backend board and orders
Kitchen	Expo strip	Station display	Station display, tickets
Rider	My Deliveries		
Call center		Console	Console, supervisor board
Manager, owner	Dashboard, approvals	Dashboard, reports	Everything

MOBILE POS The same register on a tablet in landscape.

MOBILE POS And in portrait: the order sits at the bottom.

PART 4 Setting up a restaurant, step by step

This is the order Way4Tech follows when a new restaurant goes live. Each step builds on the one before: a register needs a branch, a waiter needs a register, a kitchen screen needs product categories. Follow it top to bottom and nothing is missed. Most of it is done once; the menu and staff change often and are quick to edit later.

IN THIS PART YOU WILL LEARN

- The order in which to set up a new restaurant
- What the setup wizard builds in eight screens
- Every per-register option and what it changes
- How menus, options, kitchen stations and printers fit together

TRY IT YOURSELF ON THE DEMO

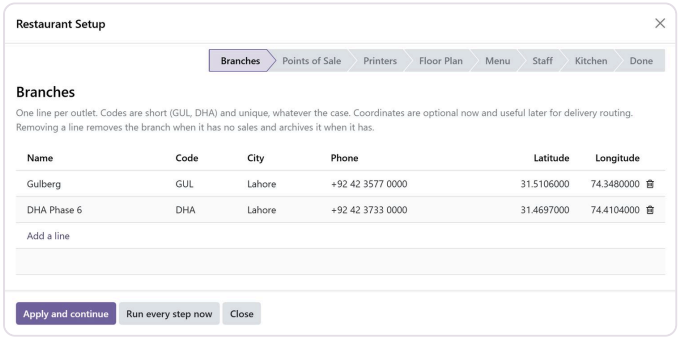

1. As the owner, open Restaurant, Configuration, Points of Sale, Restaurant Gulberg, and read the Restaurant Suite block.
2. Open Configuration, Menus and see when the Breakfast menu runs.
3. Open Configuration, Kitchen Stations and check which categories go to the Bar.

The setup order BASE

1. **Branches** outlets, hours, location
2. **Registers** one per branch, PIN rules
3. **Staff** roles, PINs, logins
4. **Floors** tables, sections
5. **Menu** dishes, options, menus
6. **Kitchen** stations, printers
7. **Money** payments, tax, service
8. **Extras** delivery, online, stock, loyalty

4.1 The setup wizard: a working restaurant in eight screens SUITE

Restaurant, Configuration, Setup Wizard. For a new restaurant this is the fastest start. It asks eight questions and builds everything that follows in this part. Every step can be skipped, and running the wizard again creates nothing twice, so it is safe to use on a restaurant that is already set up. **Run every step now** checks all steps first and then applies them with the values on screen.

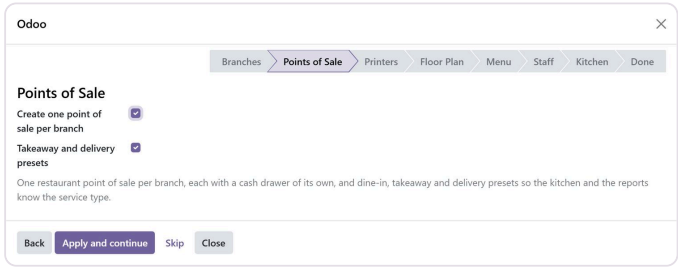

1 SUITE

Branches

One line per outlet: name, a short code (GUL, DHA), city, phone and, if known, the latitude and longitude. The code appears on receipts, kitchen tickets and reports, so keep it short.

Coordinates are optional now, but delivery zones and the call center need them later.

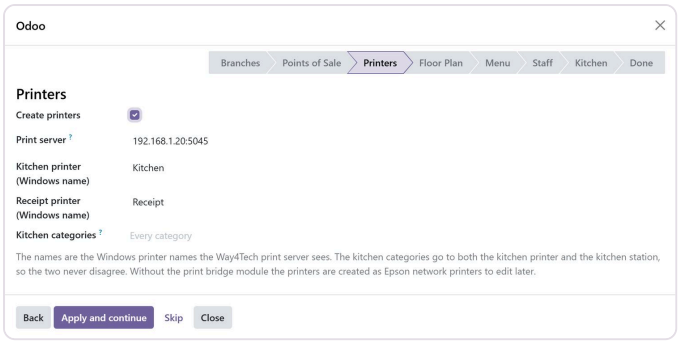

2 SUITE

Points of sale

One register per branch is created, with its own cash drawer and cash journal, and Takeaway and Delivery presets.

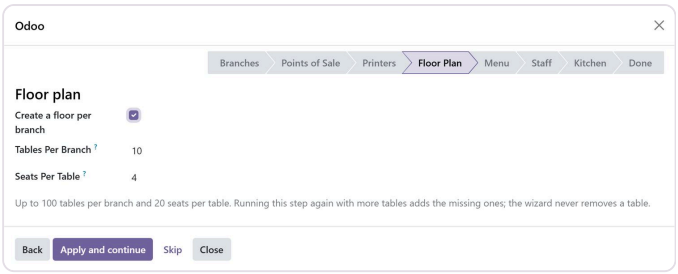

Two registers never share a cash method, so each drawer is counted on its own at closing.

3 SUITE PRINTING

Printers

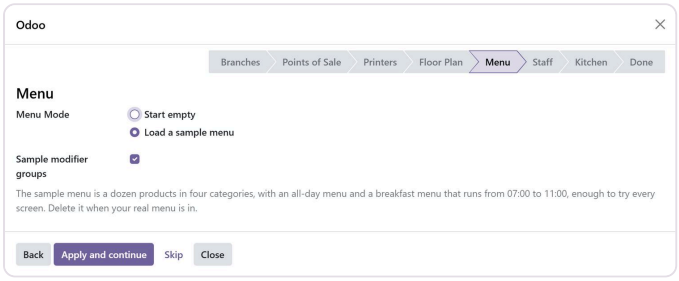

The address of the print server and the Windows names of the kitchen and receipt printers. Leave empty if the kitchen uses screens only; printers can be added later with the Add a printer wizard (4.8).

4 SUITE

Floor plan

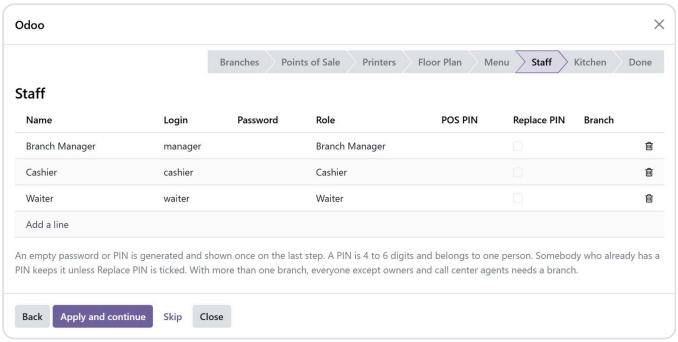

A floor per branch, with the number of tables and seats per table. More tables can be added later; the wizard never removes one.

5 SUITE MENU

Menu

Start empty, or load a sample menu and sample modifier groups to try the system before the real menu is typed.

6 SUITE BASE

Staff

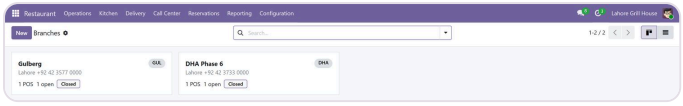

Name, login, role, POS PIN and branch for each person. Empty passwords and PINs are generated and shown once on the last screen; tick Replace PIN to give someone a new one.

Two more screens follow. **Kitchen** creates one kitchen station per branch for the kitchen display. **Done** shows what the restaurant now has, with real counts, and the generated passwords and PINs to hand out.

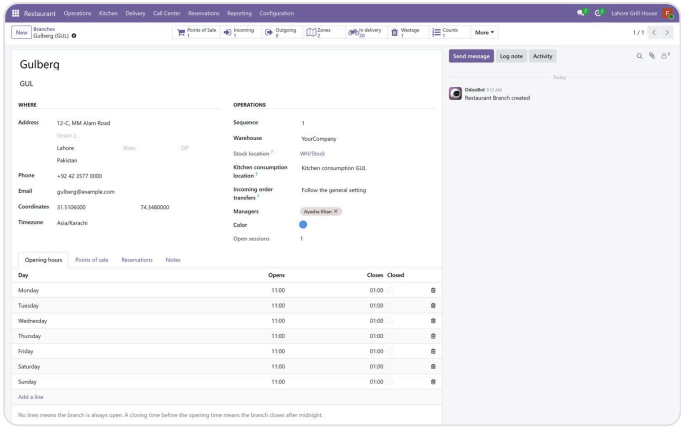

> Everything below can also be set by hand, and is where you go later to change one thing. The rest of this part follows the same order as the wizard and adds what the wizard does not ask.

4.2 Branches BASE

Restaurant, Configuration, Branches. A branch is one outlet. Every order, table, printer, rider, report and stock count belongs to a branch, and a branch manager only ever sees their own.

BASE Each branch as a card: code, phone, registers and whether it is open now.

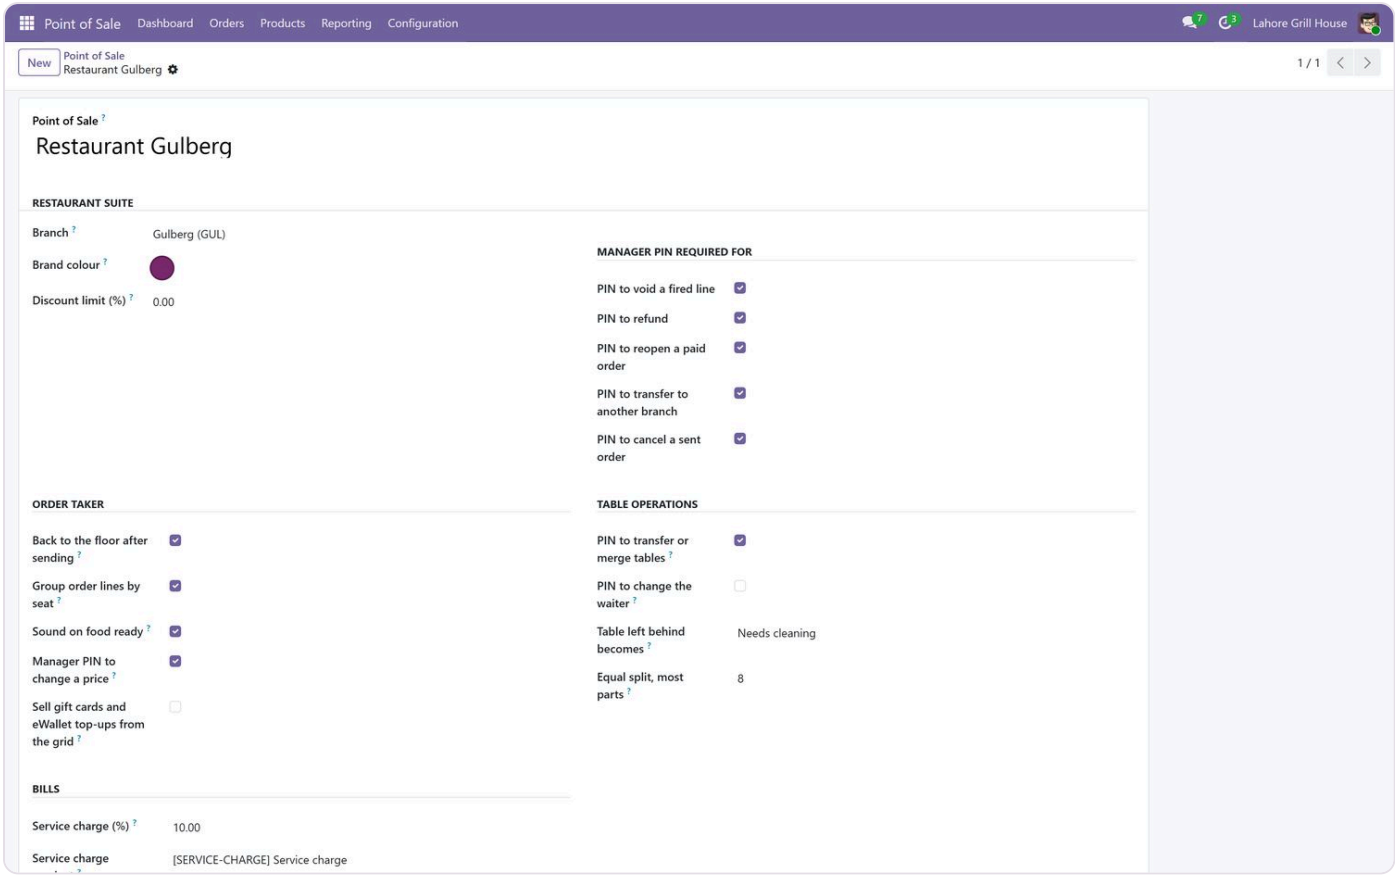

BASE The branch form: address, coordinates, time zone, managers, warehouse and opening hours.

FIELD ON THE BRANCH	WHAT IT DOES
Code	Short name on tickets, receipts and reports. Unique.
Address, latitude, longitude	Used by delivery zones, routing to the nearest branch and the call center.
Time zone	All times of the branch (menus, reports, opening hours) use it.
Opening hours	Per weekday. A window past midnight (18:00 to 02:00) is fine. Online orders and the call center check it.
Managers	Who approves for this branch and gets its alerts (low stock, bad ratings, transfers).
Warehouse	The branch stock. Created for each branch if missing, so stock and counts are kept per branch.
Reservations tab	Booking length, slots, no-show grace, reminders, deposits, waitlist times, closed days (Part 12).
Incoming transfers	Accept orders from other branches on the spot, or ask a manager (Part 13).

4.3 Registers (points of sale) BASE

Restaurant, Configuration, Points of Sale, open a register, block **Restaurant Suite**. Every option of the suite that works per till is here, grouped by module.

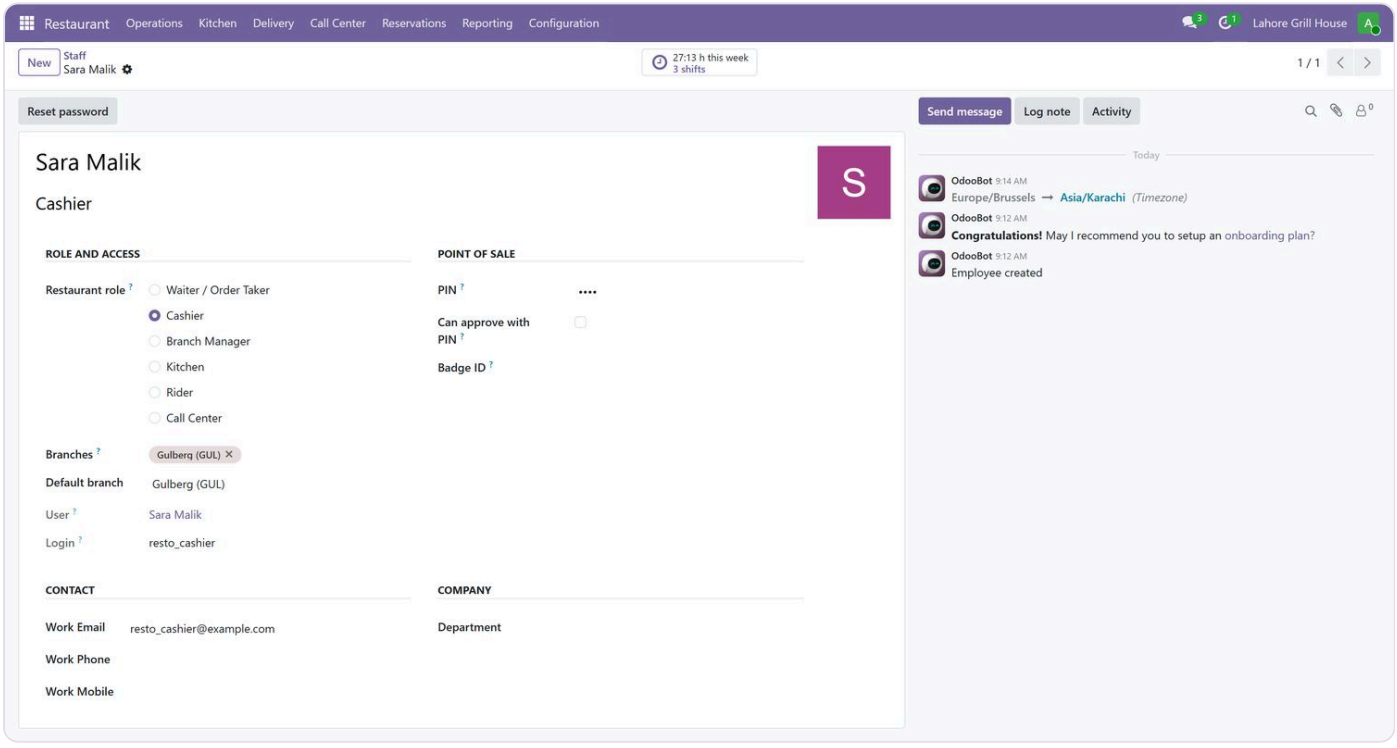

BASE The Restaurant Suite block of a register: branch, brand colour, discount limit and the manager PIN rules.

Option	Demo value	What it does
Branch	Gulberg	Links the till to its branch. Without it the Online, Deliveries and Waitlist buttons do not show.
Brand colour	#7A2A6C	Colour of buttons and chips on the till.
Discount limit (%)	0	Discounts above it, and any 100% discount, need a reason and a manager PIN.
PIN to void a fired line	On	Reducing or removing a dish already sent to the kitchen needs a manager.
PIN to cancel a sent order	On	Cancelling an order the kitchen already has needs a manager.
Manager PIN to change a price	On	Any price typed by hand needs a reason and a manager.
PIN to refund / to reopen a paid order	On	Money going back out needs a manager.
PIN to transfer or merge tables	On	Moving a table needs a manager (managers themselves never do).
PIN to change the waiter	Off	Handing a table to another waiter.
PIN to transfer to another branch	On	Sending an order to another branch (Part 13).
86 list: managers only	On	Only a manager may mark a dish sold out from the till.

Back to the floor after sending / Group by seat / Sound on food ready	On	Waiter mode (Part 5).
Service charge, tips, equal split parts	10% from 4 guests, dine-in	Bills (Part 6).
Layout, tile size, keep screen awake	Automatic, large, on	Phone and tablet layouts (Part 5).
Menus, show allergen chips	Breakfast, Late Night, All Day	Which menus this till can show (4.6).
Receipt printer, report printer, print on payment	Gulberg Receipt, on	Printing (4.8).
Fiscal configuration	FBR sandbox	Tax authority (4.10).

4.4 Staff, roles and PINs BASE

Restaurant, Configuration, Staff is the one screen for people. A branch manager never needs Odoo's Users settings: the role chosen here sets the access rights, and one button creates the login.

BASE A person: role, branches, POS PIN, whether the PIN approves voids and refunds, and the login.

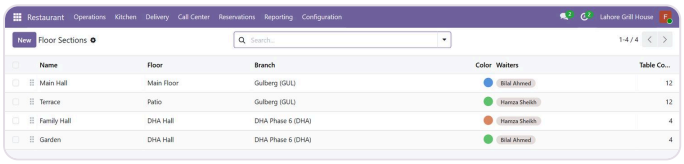

Role	Can do	Cannot do
Waiter	Open tables, take orders, send to kitchen, print the bill, run the waitlist	Take payment, move cash, close the till
Cashier	Everything a waiter does, plus payments, deliveries page, online orders	Approve voids, change settings
Branch manager	Everything a cashier does, plus PIN approvals, configuration, reports, staff of the branch	See other branches

Owner	Every branch, every report and setting; only an owner makes someone an owner	
Kitchen	Kitchen screens, tickets, wastage sheets, stock counts	Take orders or money
Rider	My Deliveries on the phone	Anything else
Call center agent / supervisor	The console, calls, complaints; supervisors see the supervisor board	Take payment

> **The POS PIN** is 4 to 6 digits, one per person. It is used to log in at the till, to clock in and out, and, for people ticked **Can approve with PIN**, to approve voids, refunds, discounts and transfers. A PIN is checked on the server and never sent to the till.

4.5 Floors, tables and sections BASE TABLE OPS

Restaurant, Configuration, Floors and Tables holds the floors of each register; tables are drawn on the plan in the till (Edit plan). A **section** groups tables for one waiter or one area (Main Hall, Terrace, Family Hall). Sections colour the plan, let a waiter see their own tables first, and send food-ready alerts only to the waiters of that section.

BASE Floor Sections: each section with its floor, branch, colour and waiters.

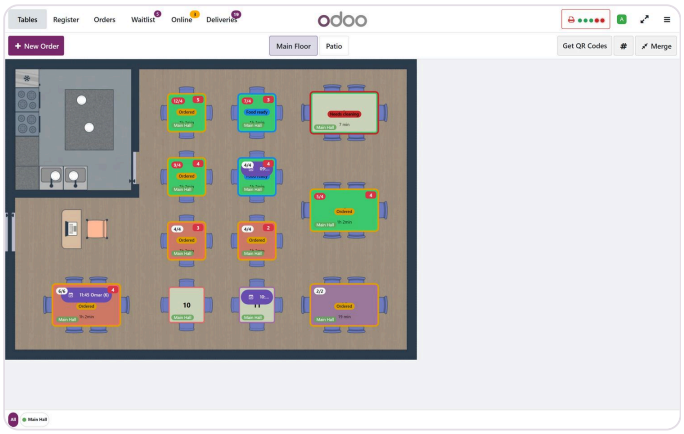

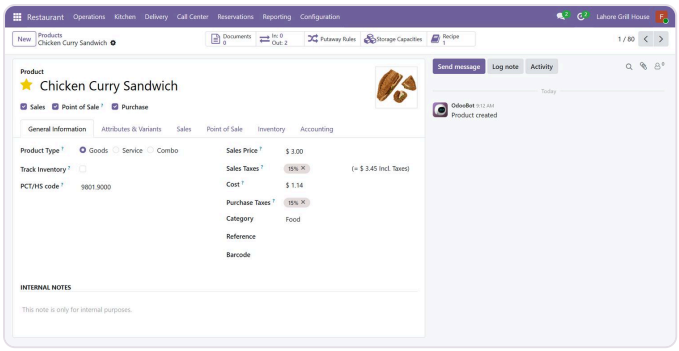

TABLE OPS On the till, the section chips under the plan filter the tables.

4.6 The menu MENU

The menu is built from ordinary Odoo products and POS categories, so nothing is locked away. The Menu module adds the restaurant rules on top. Work through it in this order:

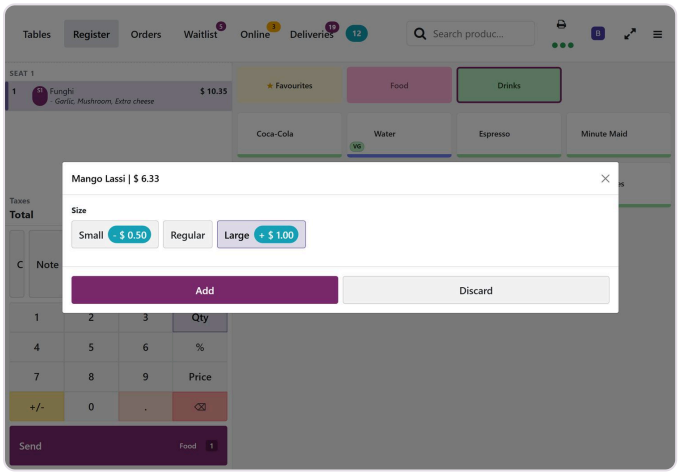

7 MENU

Dishes

Restaurant, Configuration, Products. Name, price, POS category (Food, Drinks, Desserts), tax, picture. On the Point of Sale tab: a **kitchen name** (short text the kitchen reads, for example "PZ FUNGHI"), allergens and a dietary tag (vegetarian, vegan, halal).

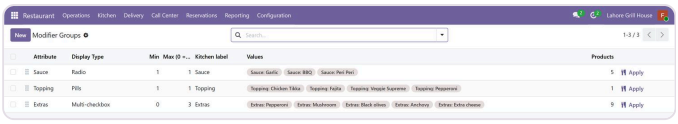

A dish with a recipe should not track its own stock: untick Track Inventory, the recipe does it (Part 14).

9 MENU

Sizes

On a product, **Add sizes** creates Small, Regular and Large with their own price difference. Do it before the dish is first sold.

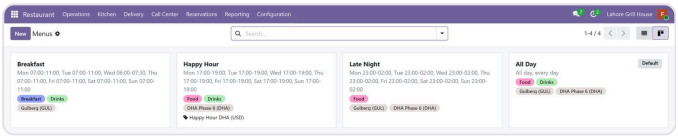

8 MENU

Modifier groups

Restaurant, Configuration, Modifier Groups. A group is a set of choices with a minimum and maximum: Sauce (choose 1), Extras (up to 3, each with a price), Spice level. **Apply to products** adds a group to chosen dishes or a whole category at once.

The till refuses Add until the choice is inside the limits, so the kitchen never gets a pizza without its sauce.

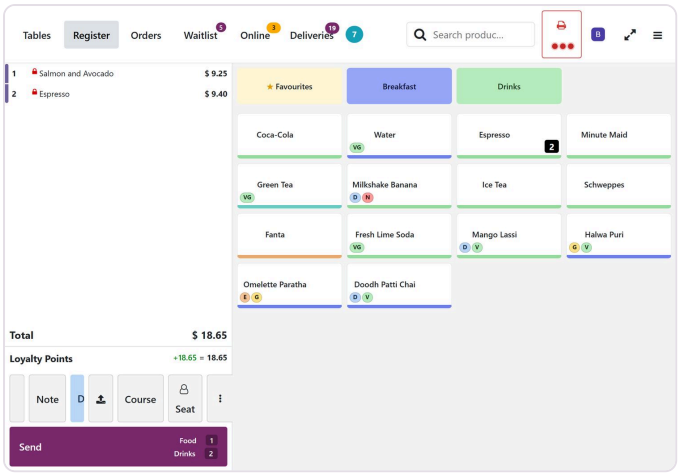

10 MENU

Menus and times

Restaurant, Configuration, Menus. A menu is a set of categories, an optional price list, and a weekly schedule. The demo has Breakfast (07:00 to 11:00), Happy Hour (17:00 to 19:00) and Late Night (23:00 to 02:00) on top of All Day. The till switches menus by itself every minute, with no reload.

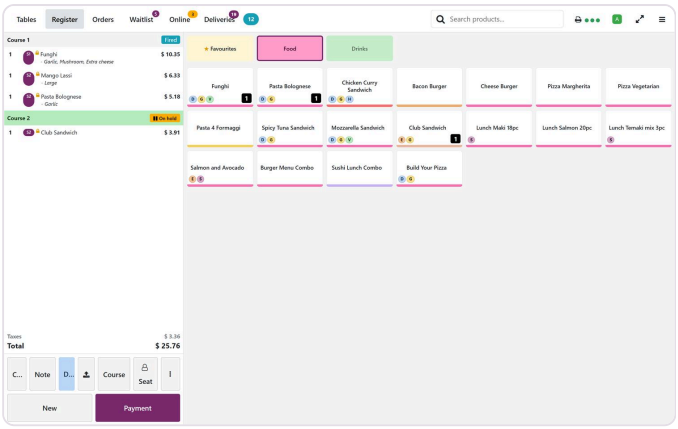

A menu with its own price list (happy hour prices) applies those prices while it is active.

11 MENU

What the waiter sees at 9 in the morning

Only the Breakfast and Drinks categories, with Halwa Puri, Omelette Paratha and Doodh Patti Chai. At 11:00 the full menu returns.

12 MENU

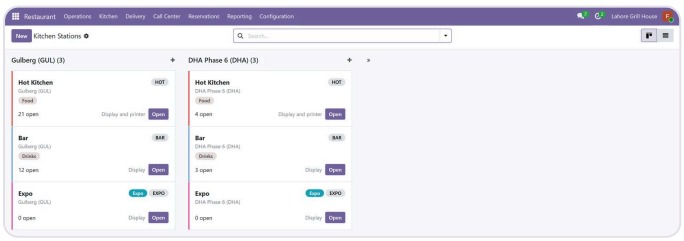

Allergens and dietary chips

Restaurant, Configuration, Allergens: name, short code, colour. The chips (D dairy, G gluten, N nuts, V vegetarian) show on every tile and in the dish information, so a waiter can answer "is there nuts in this?" without asking the kitchen.

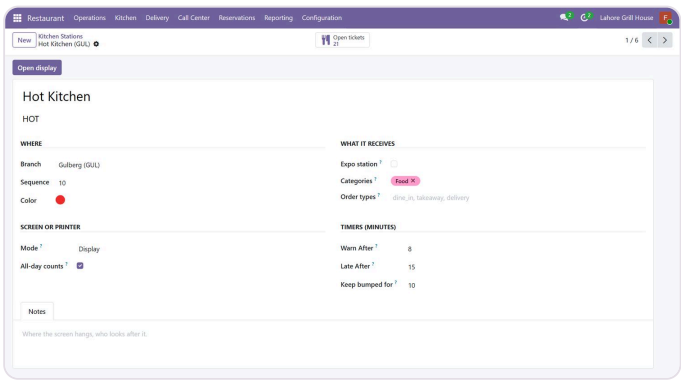

More menu tools	Where	What it does
Half and half	Product, Point of Sale tab	The guest picks a left and right half (pizza); the dearer half sets the price; the kitchen reads "1/2 Tikka, 1/2 Fajita".
Deal windows	Product: Deal from, until, days	A deal only appears on the till inside its hours and days.
Combos	Odoo combos	Burger + fries + drink as one item with choices.
86 list	Operations, 86 List, or from the till	Sold out per branch, with a reason and an optional time it comes back (Part 5).
Favourites	Configuration, POS Favourites	The star chip first on the till, in the order you drag the rows.

4.7 Kitchen stations KITCHEN DISPLAY

Restaurant, Configuration, Kitchen Stations. One station per screen in the kitchen: Hot Kitchen, Bar, Grill, Pastry. A station cooks some POS categories; a dish goes to every station whose categories include it. Tick **Expo** for the pass. Set when a ticket turns amber (warn after) and red (late after), and how long a bumped ticket stays in the Done strip.

KITCHEN DISPLAY Stations per branch: Hot Kitchen, Bar and Expo, each with its open tickets.

KITCHEN DISPLAY A station: categories, timers, order types and mode (screen, printer or both).

4.8 Printers PRINTING

Odoo Community normally needs an IoT box to print from the till. The suite prints without one, two ways:

Network printer, direct

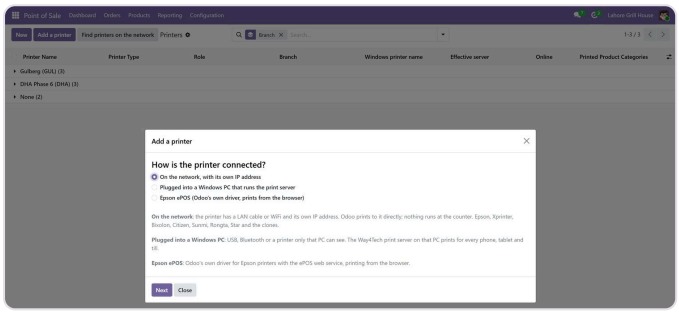

The printer has an IP address on the restaurant network. Odoo sends the ticket straight to it in its own language: ESC/POS (Epson, Xprinter, Bixolon, Sunmi and clones) or Star raster (Star TSP100, TSP143, TSP650).

Way4Tech print server

A small Windows service on a PC in the restaurant prints on any printer Windows sees: USB, Bluetooth, LAN, label printers, an A4 laser for reports.

Backup printer

If the kitchen printer is off, the ticket goes to its backup with a band "REROUTED: Kitchen did not answer". The cashier sees which printer took it.

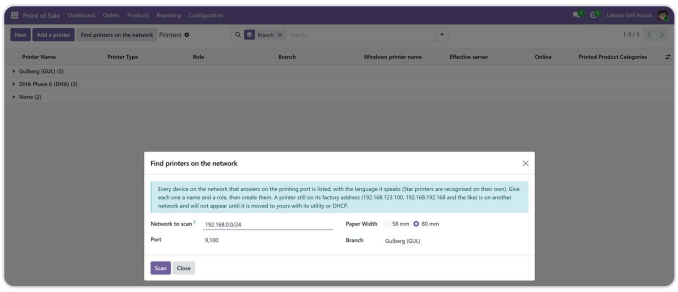

13 PRINTING

Add a printer

Point of Sale, Configuration, Add a printer. Three screens: how it is connected, where it is (type the IP or scan the network; pick the Windows printer from the list), and what it prints for which registers. It creates the printer, links it and prints a test page.

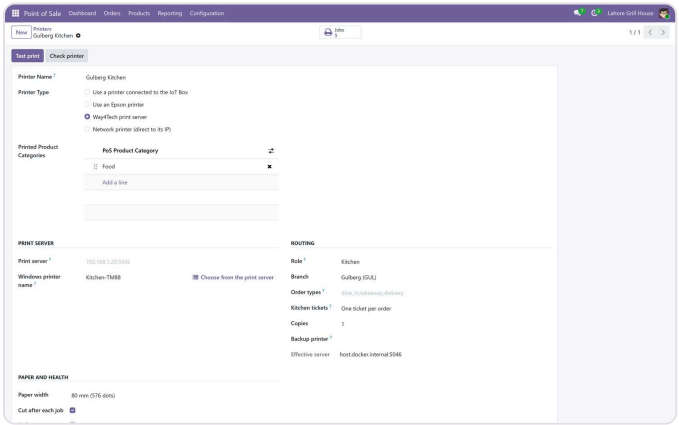

The Windows printer name is picked from a list, never typed: a typo in that name is the most common reason nothing prints.

14 PRINTING

Find printers on the network

Every device answering on port 9100 is listed. A Star printer is recognised by itself. Tick, name, pick a role and paper width.

15 PRINTING BASE

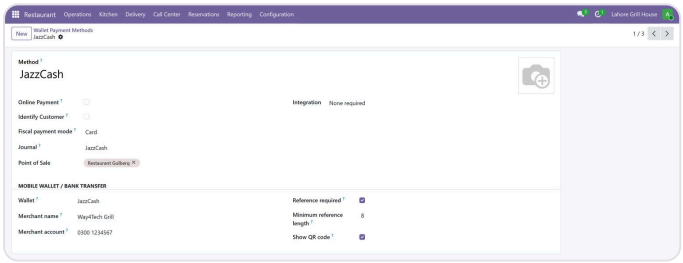

The printer form

Type, address, language, paper (58 mm, 80 mm, 80 mm narrow), copies, cut, cash drawer, one ticket per order, per line or per item (labels for cups), the branch and the order types it takes (a bar printer can skip delivery tickets).

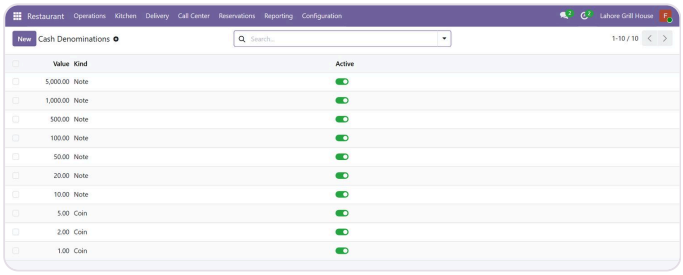

What prints	When	Where
Kitchen ticket	Send, or firing a course	Each kitchen or bar printer, only the lines of its categories
VOID ticket	A sent dish is removed with a manager PIN	The printers that had the dish
TABLE MOVED	A table with food in the kitchen is moved or merged	The stations that hold its lines
Bill	Bill button	Receipt printer
Receipt	On payment (or from the receipt screen)	Receipt printer; the cash drawer opens on cash
Delivery slip	Delivery orders, Actions, Delivery Slip	Receipt printer, with a maps QR
Day report	Day report, Print on receipt printer	Report printer

4.9 Payments, wallets and cash WALLET PAYMENTS REPORTS

Cash and card are standard Odoo payment methods. In Pakistan and the Gulf most other payments are mobile wallets and bank transfers. **Restaurant, Configuration, Wallet Methods:** make a method for JazzCash, EasyPaisa, SadaPay, NayaPay or a bank transfer, with the merchant account the guest pays to and whether a transaction reference is required.

WALLET PAYMENTS A wallet method: wallet, merchant account, merchant name, reference rules, QR.

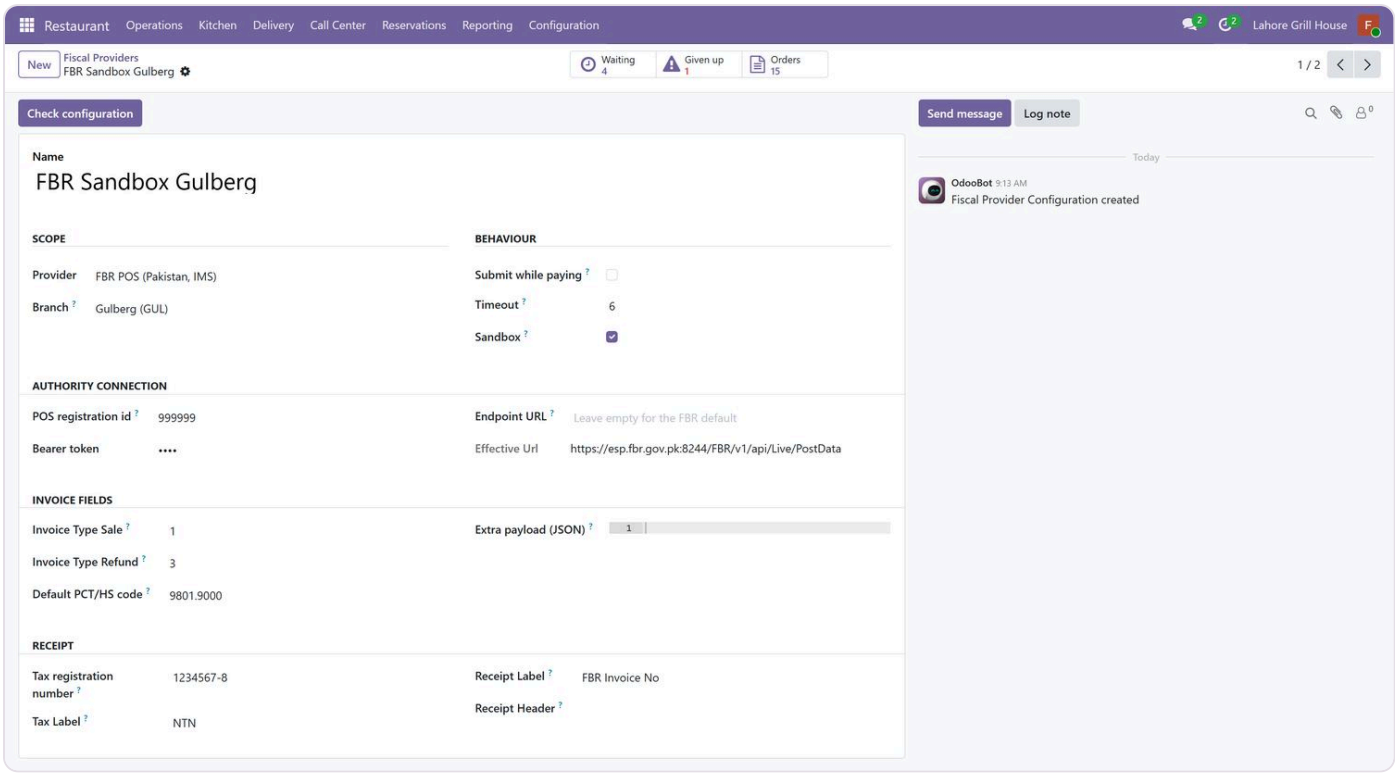

REPORTS Cash Denominations: the notes and coins counted at closing (PKR 5000 down to 1).

4.10 Taxes and fiscal receipts FISCAL

Restaurant, Configuration, Fiscal Providers. Where the law asks for it, every paid order is reported to the tax authority and the receipt carries its invoice number and QR. One configuration per company or per branch:

Provider	Country	How it works
FBR POS (IMS)	Pakistan, federal	Posted to FBR while paying; the FBR invoice number and QR print on the receipt.
PRA, SRB, KPRA	Punjab, Sindh, Khyber Pakhtunkhwa	Same, with the endpoint and codes from the authority's onboarding pack.
ZATCA Phase 1	Saudi Arabia	No API. Receipt headed "Simplified Tax Invoice" with the Phase 1 QR.
UAE VAT	United Arab Emirates	No API. Receipt headed "Tax Invoice" with the TRN.

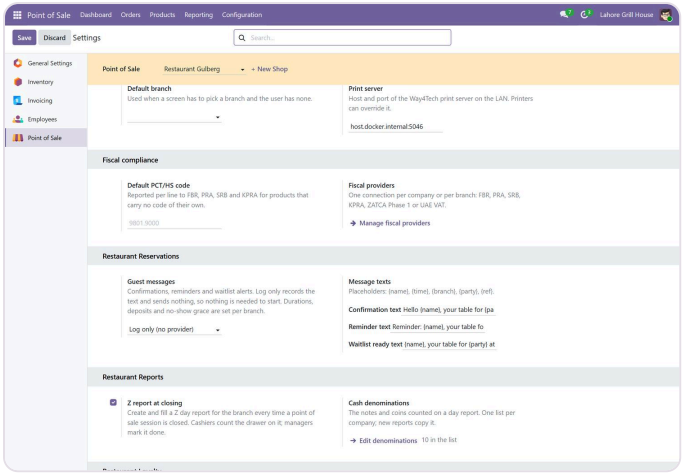

FISCAL An FBR configuration for the Gulberg branch: registration id, token, sandbox, submit while paying.

> The till never waits for the tax authority. If it is slow or down, the receipt says "Fiscal invoice pending", the order is queued and retried after 1, 5, 15 and then every 60 minutes (Part 16, Fiscal Queue). Production registration with each authority is done by the restaurant; the module comes ready for it.

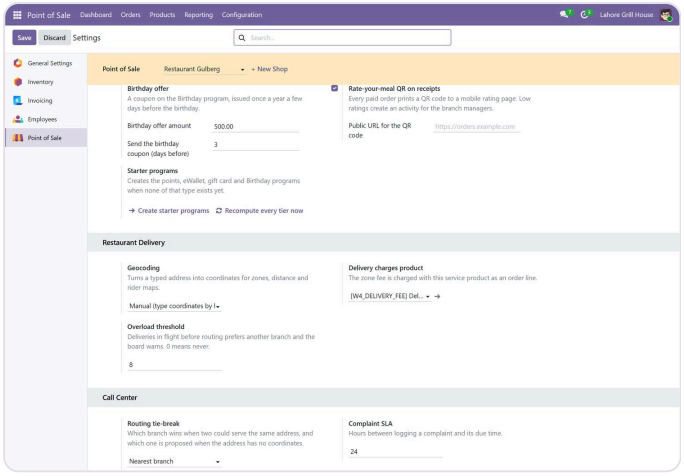

4.11 Restaurant settings BASE

Restaurant, Configuration, Settings (administrator) holds what applies to the whole company, one block per module:

BLOCK	SETTINGS
Restaurant Suite	Default branch; print server address
Fiscal compliance	Default PCT/HS code for products without their own; link to the fiscal providers
Restaurant Reservations	How guest messages are sent (log only, Odoo SMS, WhatsApp webhook) and the confirmation, reminder and table-ready texts
Restaurant Reports	Z report at closing; cash denominations
Restaurant Loyalty	Birthday coupon amount and days before; rate-your-meal QR on receipts and its public address; starter programs
Restaurant Delivery	Geocoding (OpenStreetMap, Google or manual); delivery charge product; overload threshold
Call Center	Routing tie-break; complaint SLA hours; default promised times; telephony token
Branch Transfers	Which branch reports the revenue of a transferred order; auto-accept transfers

BASE Settings: Restaurant Suite, Fiscal and Reservations blocks.

LOYALTY Settings: Loyalty, Delivery and Call Center blocks.

4.12 Delivery, online, stock and guests

These depend on the restaurant and each has its own part with the full setup. In short:

If the restaurant	Set up	See
Delivers	Delivery zones (circle or polygon, fee, minimum, promised time), riders, the Delivery preset	Part 9
Takes online orders	An online channel per website, app or aggregator; give its link to their developer	Part 10
Has a call center	Agent logins, routing and promised times, the telephony token for the phone system	Part 11
Takes bookings	Per branch: booking length, slots, deposits, no-show grace; message texts	Part 12
Wants food cost and stock	Ingredients with cost, a recipe per dish, par levels, a first stock count	Part 14
Runs loyalty	Tiers with their discount and price list, birthday offer, feedback QR	Part 15

Go-live checklist

- Every branch has its code, address, time zone and opening hours.
- Every register has its branch, and the PIN rules the owner wants.
- Every person has a role, a branch and a POS PIN; managers can approve.
- Floors match the real room; sections have their waiters.
- The full menu is in, with kitchen names, options and allergens.
- A test order from each register reaches every kitchen screen or printer.
- A test receipt prints, the drawer opens, the bill shows the service charge.
- Wallet methods carry the real merchant numbers.
- The fiscal provider is out of sandbox, if the law requires it.
- Cash denominations match the local currency.
- A test session is opened, paid and closed, and its Z report checked.
- The test orders are cancelled and the staff have their PINs.

PART 5 Taking orders: the waiter

ORDER TAKER

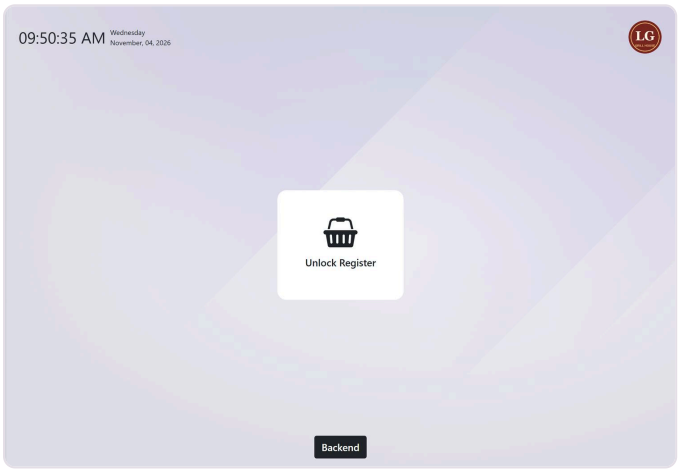

The waiter works on a tablet or a phone, at the table. The system is built so a waiter can do everything a guest needs except take money: open the table, take the order seat by seat and course by course, send it to the kitchen, and hear when the food is ready.

IN THIS PART YOU WILL LEARN

- How a waiter opens a table and takes an order seat by seat and course by course
- What the kitchen ticket carries
- Why a sent dish is locked and how a manager approves a change
- How tables change colour on their own

TRY IT YOURSELF ON THE DEMO

1. Log in as the waiter, open table 12 and add a Funghi with Mushroom and Extra cheese for Seat 1.
2. Add a Large Mango Lassi for Seat 2, start Course 2, add a Club Sandwich and Hold the course.
3. Send, reopen the table and try to remove the Funghi: type a reason, then the manager PIN 7410.

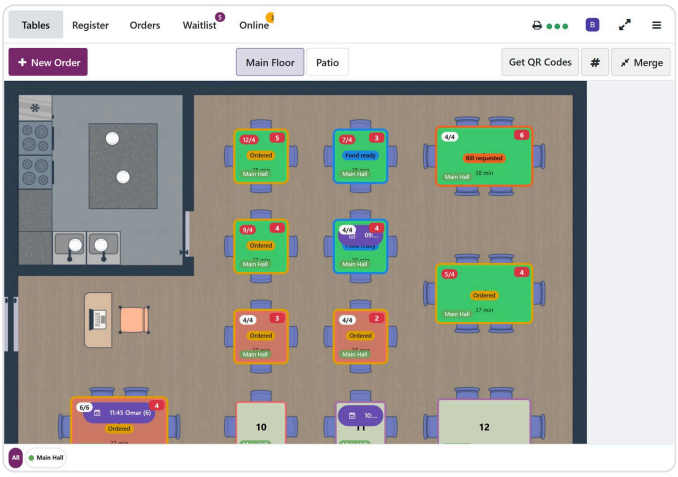

1 ODOO POS BASE

Open the register

The till opens on the lock screen. Tap **Unlock Register**, pick your name and type your POS PIN. With employee logins, every action after this is recorded under your name.

The buttons across the top (Waitlist, Online, Deliveries) carry live counts for this branch.

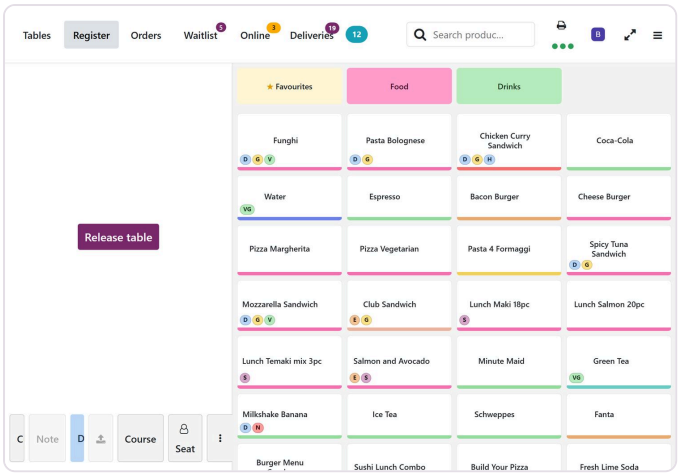

2 BASE ORDER TAKER

Read the floor plan

Every table shows its state by colour and label: **Ordered** (amber), **Food ready** (blue), **Bill requested** (orange), **Needs cleaning** (red), free (no ring). The corner shows guests and seats (12/4), a timer shows minutes in that state, and a purple chip shows the next booking (11:45 Omar, party of 6).

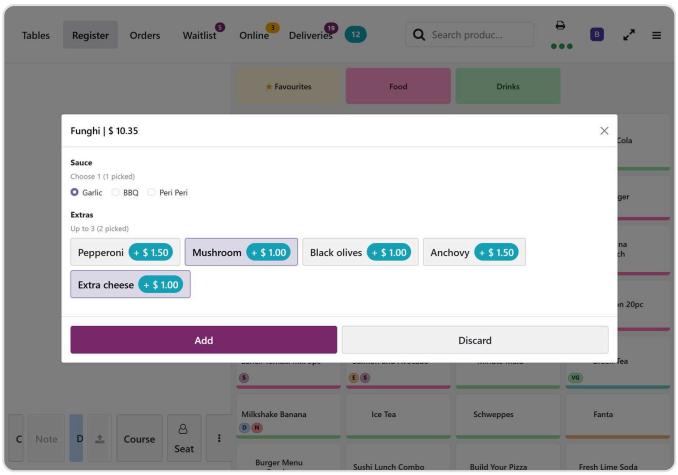

The chips under the plan (All, Main Hall) filter tables by section.

3 ODOO POS ORDER TAKER

Open a table

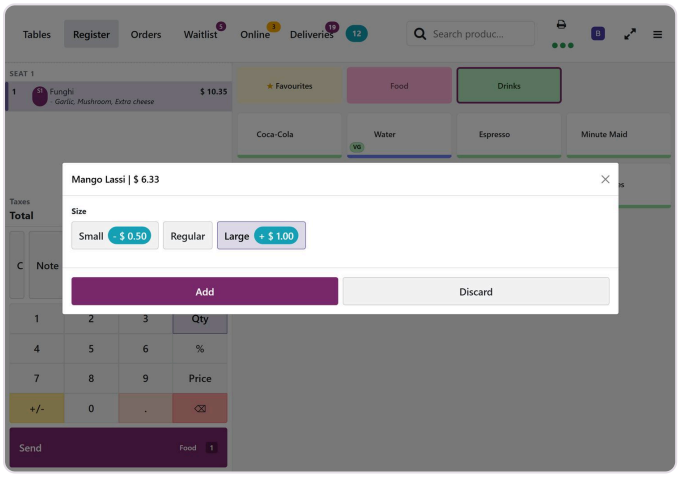

Tap a free table. An empty order opens on the product screen. **Release table** frees it again if the guests leave before ordering.

4 MENU

Add a dish with its options

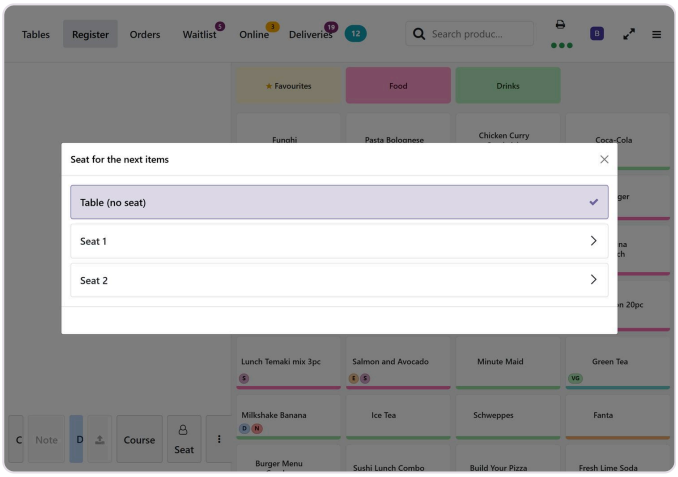

Tap the dish. If it has options, the options window opens: here Funghi needs exactly one sauce (Garlic is the default) and takes up to three extras, each with its price. **Add** stays off until the choice is inside the limits.

5 MENU

Pick a size

A dish with sizes asks for one: Mango Lassi Small (0.50 less), Regular, Large (1.00 more).

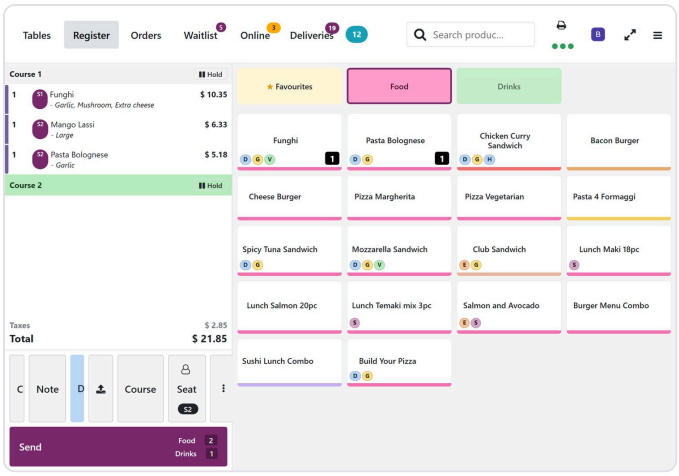

6 ORDER TAKER

Order seat by seat

Tap **Seat** and pick the guest before tapping their dishes. Lines carry an S1, S2 badge, the kitchen ticket shows it, and the bill can later be split by seat. Lines of different seats never merge.

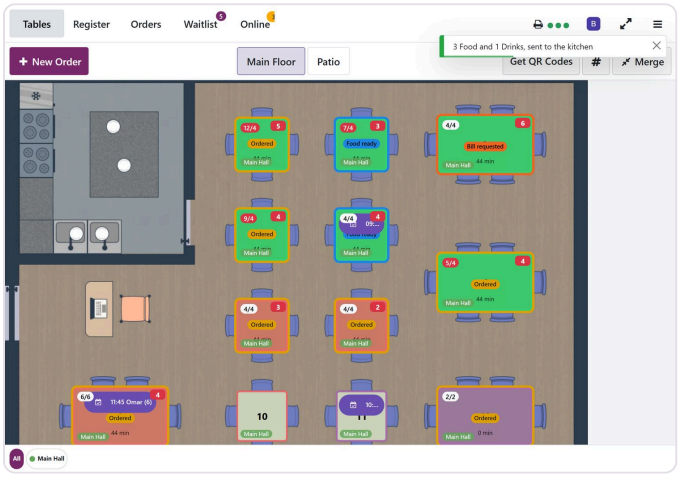

The seat list follows the number of guests on the table.

7 ORDER TAKER

Courses

Tap **Course** to start a new course. Each course has its own block on the order: starters in Course 1, mains in Course 2.

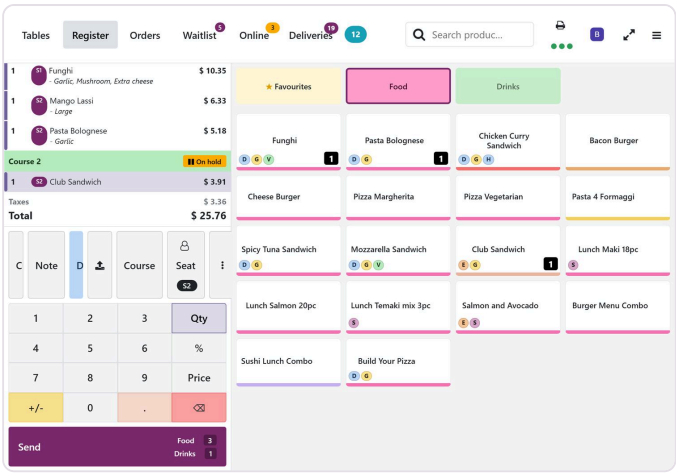

9 ORDER TAKER PRINTING KITCHEN DISPLAY

Send to the kitchen

Send shows what goes where (Food 3, Drinks 1). The tickets go to the kitchen screens and printers of their stations, the lines lock, the table turns **Ordered** on every device, and the till goes back to the floor plan.

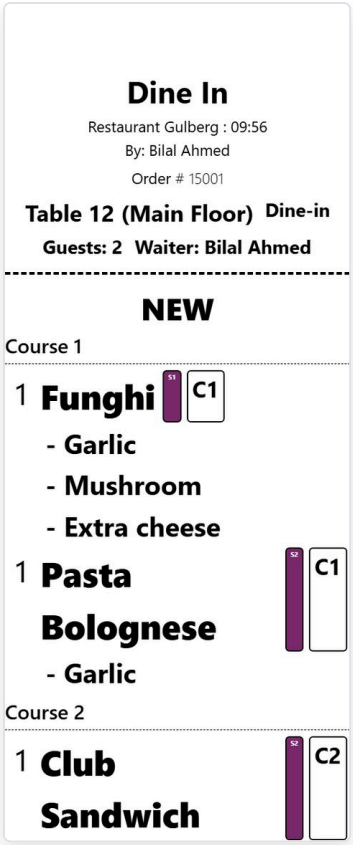

A notice confirms: "3 Food and 1 Drinks, sent to the kitchen".

8 ORDER TAKER KITCHEN DISPLAY

Hold a course

Tap **Hold** on a course the guests are not ready for. A held course is not cooked when the order is sent; the kitchen screen shows it dimmed with HOLD at the end of its grid. Release it later to fire it.

Kitchen printer: table, floor, guests, waiter, course headers, seat (S1) and course (C1) badges, every option.

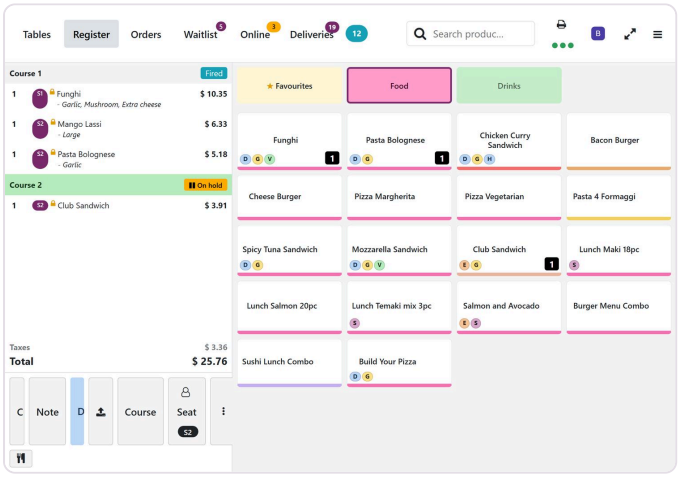

Bar printer: only the drinks of the same order.

After a manager approved removing the Funghi: a VOID ticket at the kitchen.

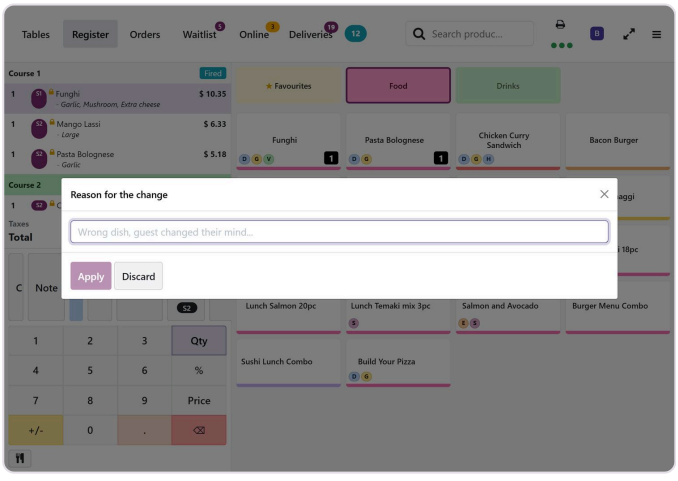

After the order is sent ORDER TAKER

10 ORDER TAKER

Sent lines are locked

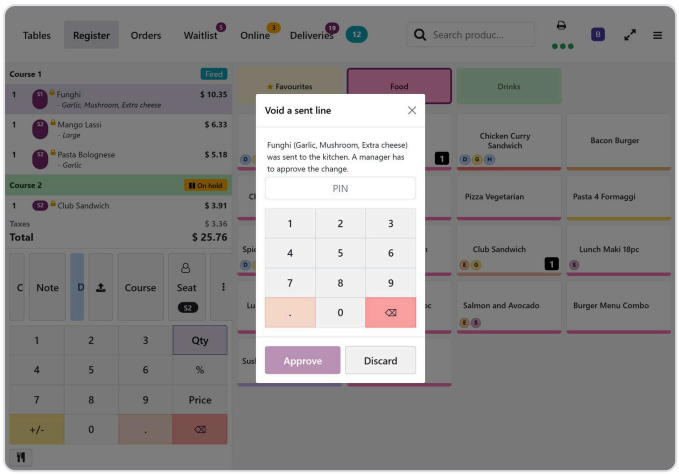

Reopen the table: every sent line carries a lock, and Course 1 shows **Fired**. Adding more of the same dish makes a new line and needs nobody's approval.

11 ORDER TAKER

Removing a sent dish asks why

Select a sent line and reduce it or press delete. The till asks for the reason first ("Wrong dish, guest changed their mind").

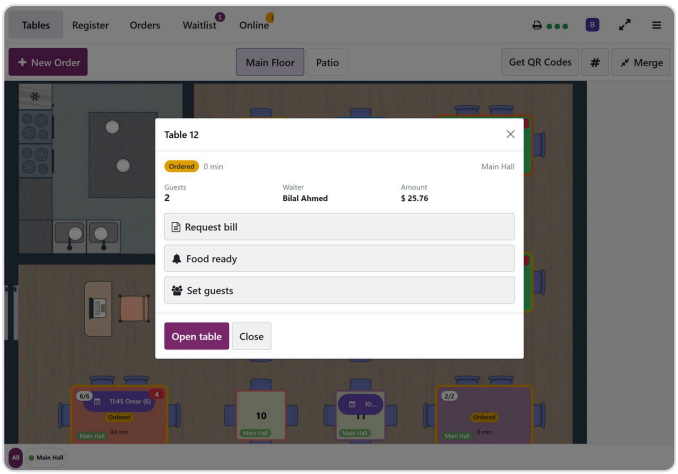

12 ORDER TAKER BASE PRINTING

And a manager PIN

Then a manager types their PIN. A wrong PIN is refused and nothing changes. When approved, a VOID ticket prints at the stations that had the dish, and the change is written to the audit log with who asked, who approved and the amount.

The same PIN rule protects a price typed by hand, a discount above the limit, cancelling a sent order and refunds.

13 ORDER TAKER

Long-press a table

Press and hold a table on the plan (right-click on a computer). A small card shows its state, time, guests, waiter and amount, with quick buttons: Request bill, Food ready, Set guests, Open table, Mark clean.

HOW IT WORKS

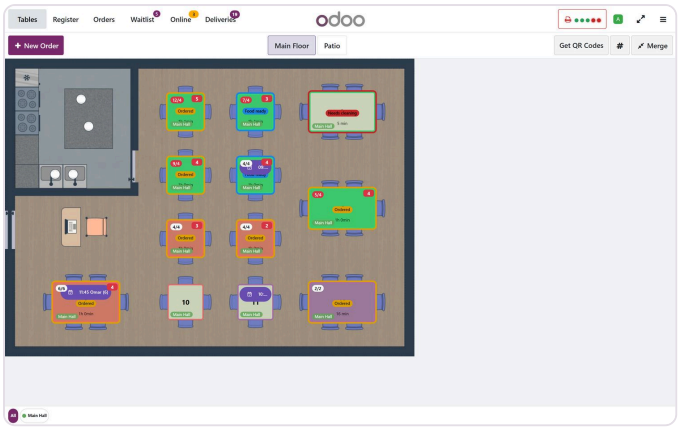

what changes a table's colour

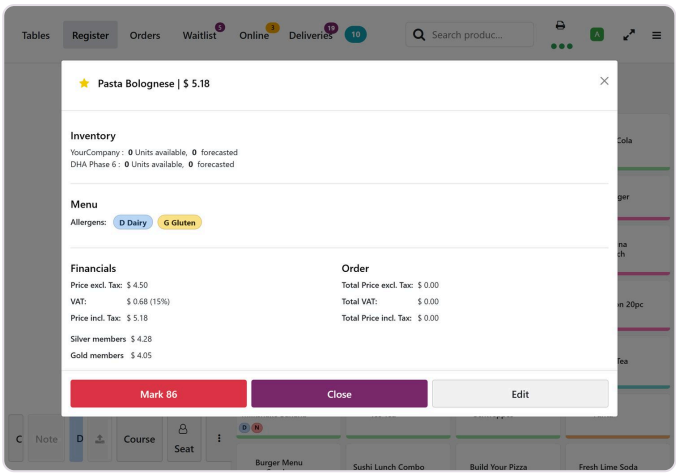

Nobody colours a table by hand. The system follows the order:

- **Occupied** when the first item lands on a new order, **Ordered** when it is sent to the kitchen.
- **Food ready** when the kitchen bumps the last station of the ticket (or a manager taps Food ready).
- **Bill requested** when the bill is printed, **Paid** then **Needs cleaning** when the paid order leaves the table.
- **Free** when someone taps Mark clean. **Reserved** 30 minutes before a confirmed booking (Part 12).

The server keeps the same rules, so a second device, a backend change or a phone order never leaves a table in the wrong colour.

Food ready, sold out and the dish card ORDER TAKER MENU

14 ORDER TAKER KITCHEN DISPLAY

Food ready alert

When the kitchen finishes a ticket, the table turns blue and the waiters of that section get a sticky notice with a bell and the list of items. Without a kitchen screen, a manager sends the same alert from the Table Board.

15 MENU

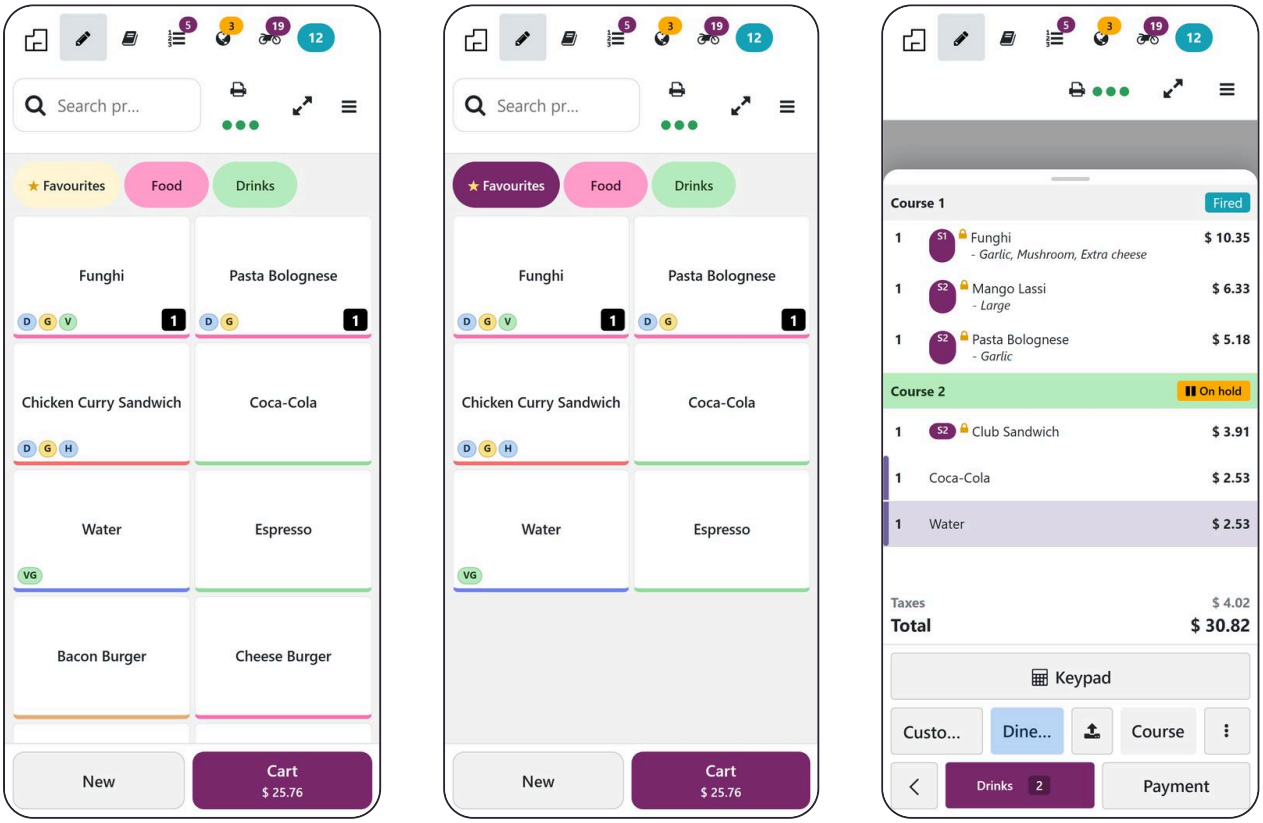

The dish card and 86

Press and hold a dish. The card shows its allergens, stock, price before and after tax, and the price for Silver and Gold loyalty members. **Mark 86** marks it sold out at this branch: every till of the branch greys it out with an "86" ribbon at once, and a tap only shows the reason.

With "86 list: managers only" on, a waiter is asked for a manager PIN.

The waiter on a phone MOBILE POS

The same till on a phone is laid out for one hand: big tiles three across, category chips in a strip, a search box always open, and a bottom bar with the total and a **Cart** button. Swipe a line left to delete it. Favourites come first. It installs as an app on the home screen and keeps the screen awake during service.

Phone: the product grid, the Favourites chip, and the cart sheet.

PART 6 Tables and bills

TABLE OPS

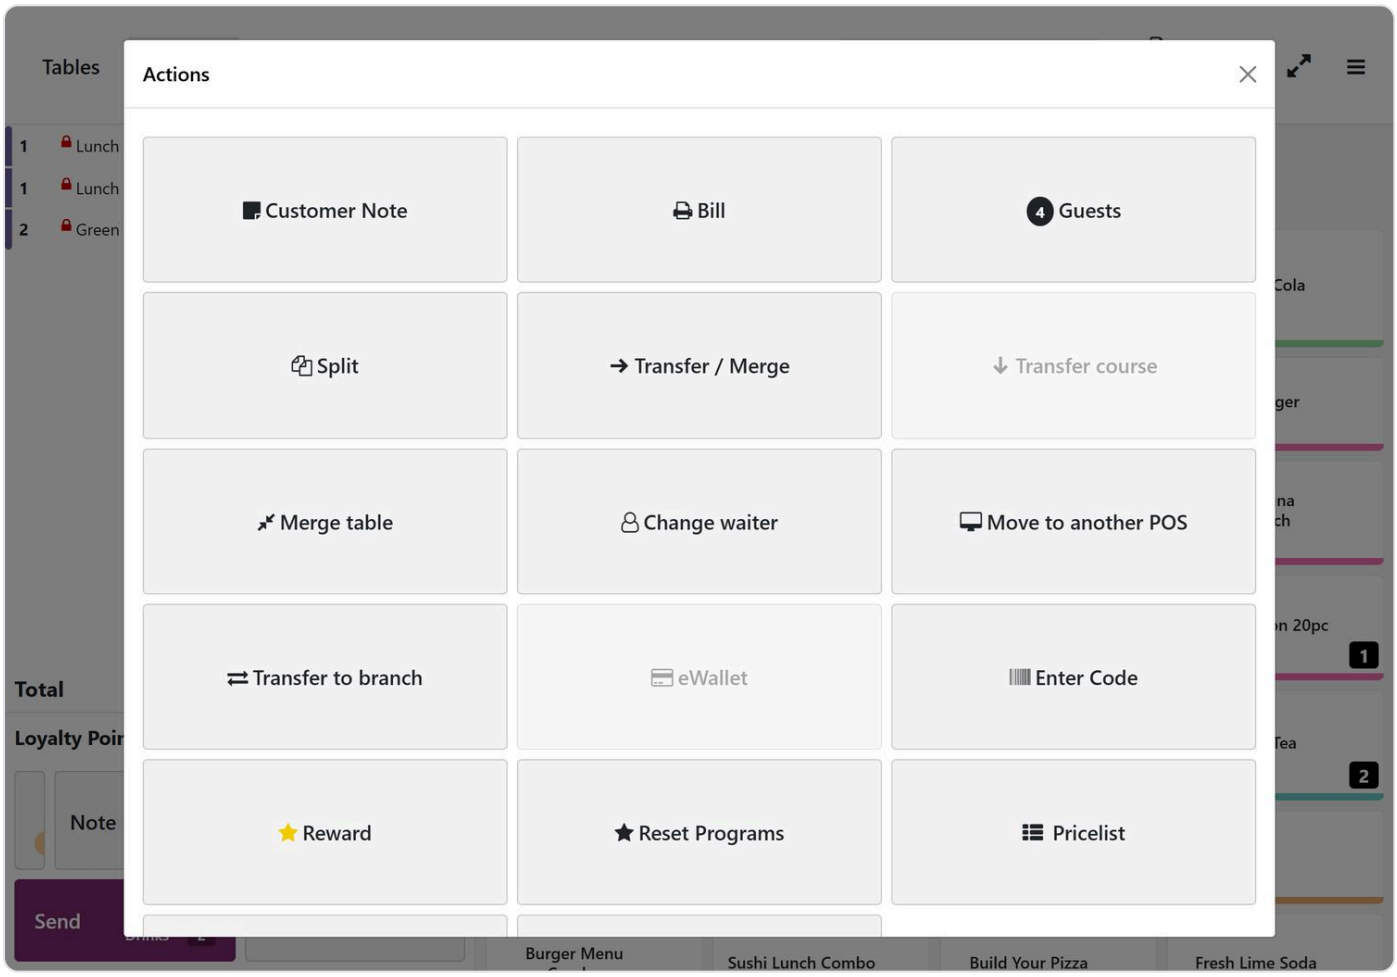

Guests move, join other tables, want separate bills, and stay when the waiter's shift ends. Every one of these is a button on the till, logged with who did it and, where the owner wants, approved with a manager PIN.

IN THIS PART YOU WILL LEARN

- How to move, merge and split tables
- The four ways to split a bill and how cents are never lost
- How the service charge is calculated and protected
- Where every table move is recorded

TRY IT YOURSELF ON THE DEMO

1. As the manager, open table 4, Actions, Change waiter, and hand it to Hamza.
2. Open table 9, Actions, Split, Equal parts, 3, and look at each part.
3. Open Reporting, Table Operations and find your change.

ODOO POS TABLE OPS The Actions menu of a table: bill, guests, split, transfer and merge, course transfer, change waiter, move to another register or branch.

Action	What happens	PIN
Transfer / Merge	Tap the destination table. The order moves; the old table becomes Needs cleaning (or Free, per register).	Manager PIN by default
Merge table	Two tables for one party: the orders merge, the tables link and the order reads "T 5 & 6".	Manager PIN by default
Split (table)	Pick lines and send them to another table.	

Change waiter	Hand the order to another waiter or cashier, for example at a shift change.	Off by default
Move to another POS	Send the order to another register of the same branch (for example the bar till).	Manager PIN by default
Transfer to branch	Send the order to another branch (Part 13).	Manager PIN by default

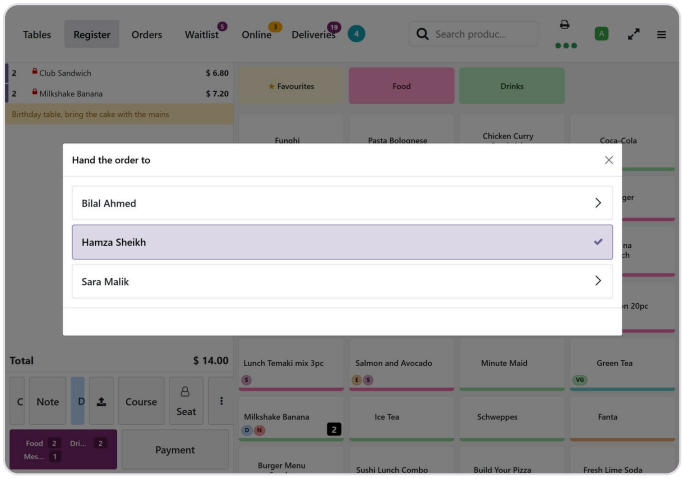

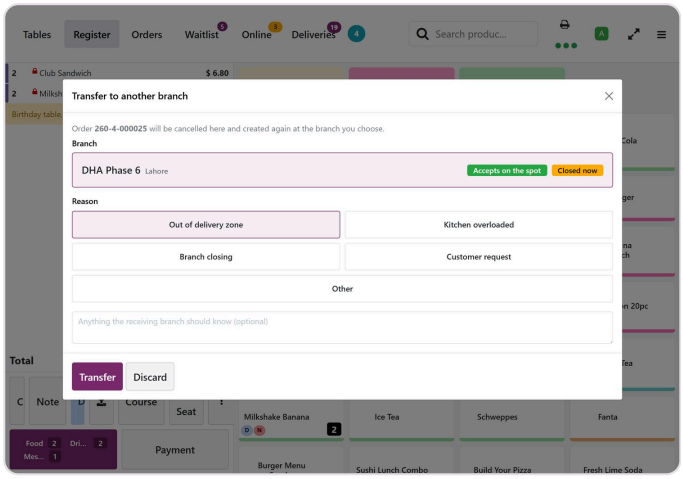

TABLE OPS Change waiter: pick who takes over the table.

BRANCH TRANSFER Transfer to branch: the branch, whether it accepts on the spot, and a reason.

> When a table with food in the kitchen is moved or merged, the stations that hold its dishes get a **TABLE MOVED: 5 to 8** notice, so the runner takes the plates to the right table.

Four ways to split a bill TABLE OPS

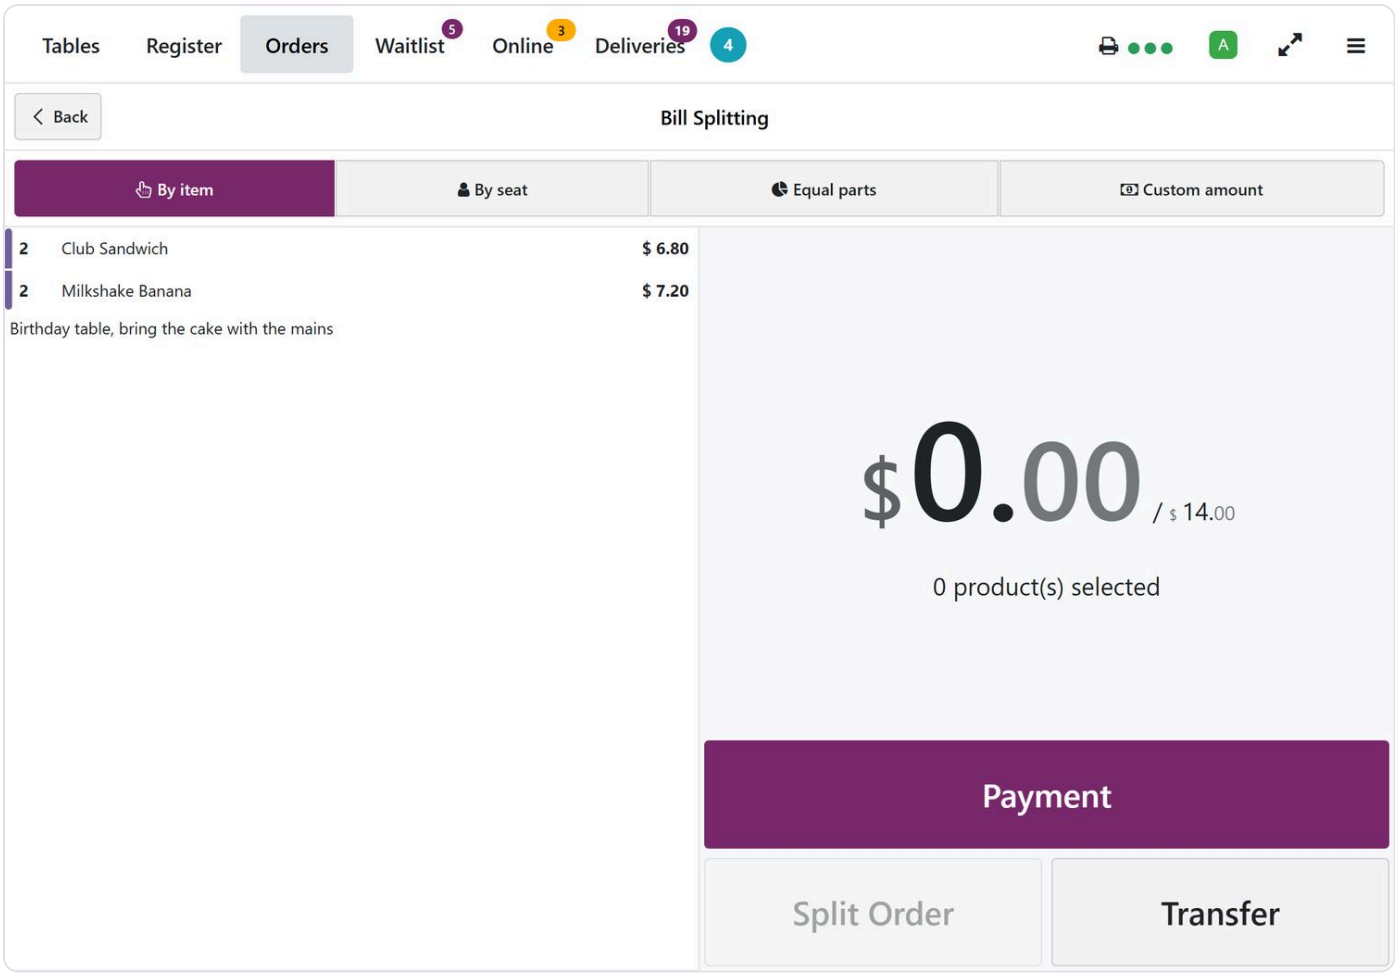

TABLE OPS Bill Splitting: By item, By seat, Equal parts, Custom amount.

Way	How	Example
By item	Tap the lines each guest pays for.	One guest pays for the drinks.
By seat	Tap a seat chip: every line of that seat is selected.	Seats 1 and 2 pay separately (needs seats, Part 5).
Equal parts	Type the number of parts (up to 8). Each part is worth exactly its share.	2.20 in three is 0.74, 0.73, 0.73: never a cent lost.
Custom amount	Type what one guest pays now; the rest stays on the table.	A guest leaves early and pays 1,000.

Service charge and tips TABLE OPS

On each register (Restaurant Suite, Bills): a **service charge** rate, from how many guests it applies, and on which service (dine-in, takeaway, delivery). The demo charges 10% on dine-in tables of four or more.

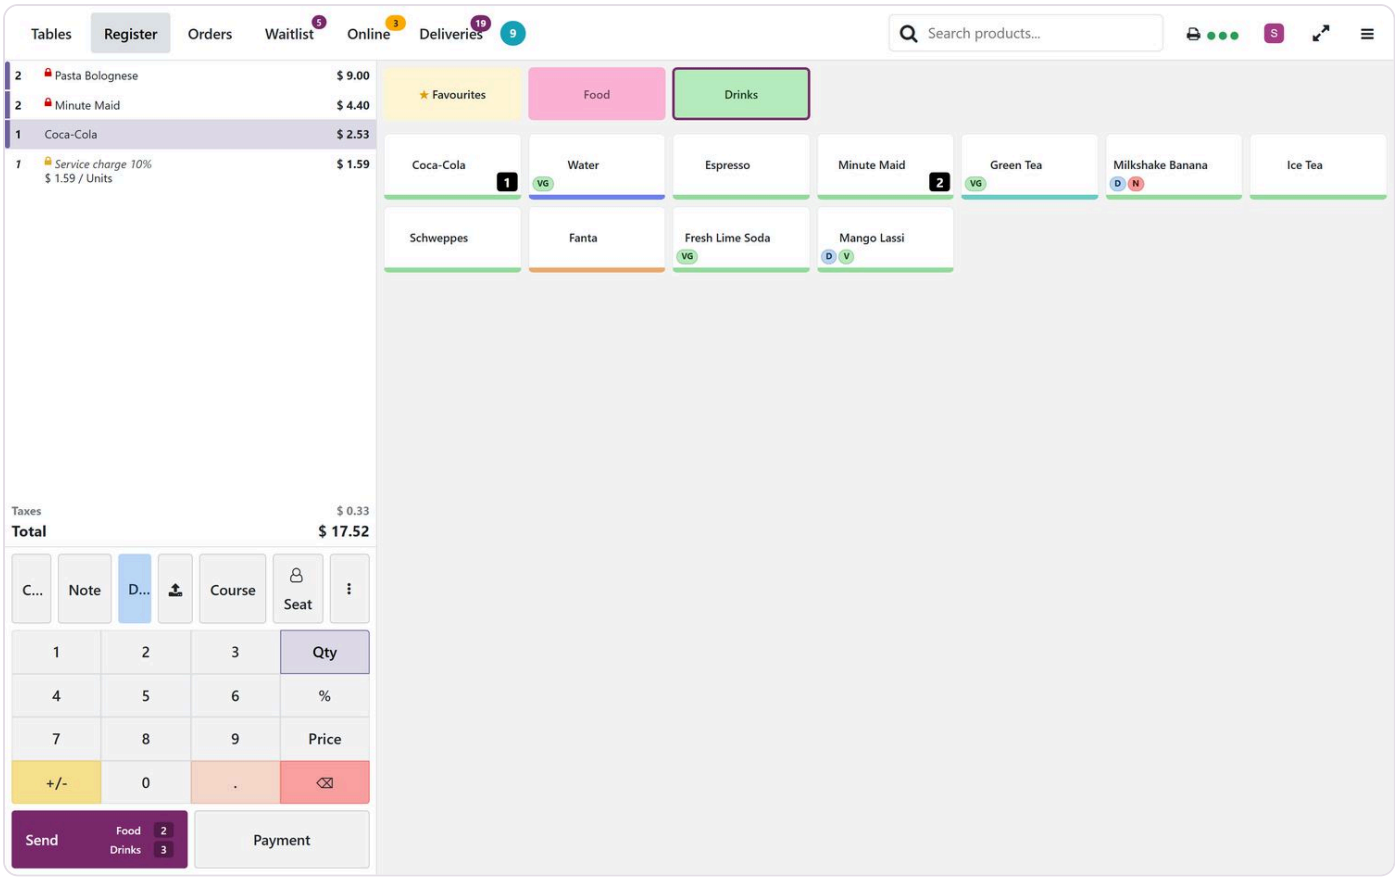

TABLE OPS The charge appears as one line, "Service charge 10%", and follows every change to the order.

HOW IT WORKS

the service charge is worked out

One line, worth the rate applied to the total of every other line including tax, except tips. It is recalculated on every change: add a dish and it grows, drop below the guest threshold and it goes. 10% of 1,234.56 is 123.46.

The waiter cannot change or delete it from the keypad. **Actions, Remove service charge** needs a manager PIN (unless the register allows cashiers), and both removal and restore are logged with the amount. When the bill is split, each part carries its own share.

Tips are Odoo's own Tip button on the payment screen. The suite records which waiter served the order, so **Reporting, Tips by Waiter** shows tips and service charges per waiter per day.

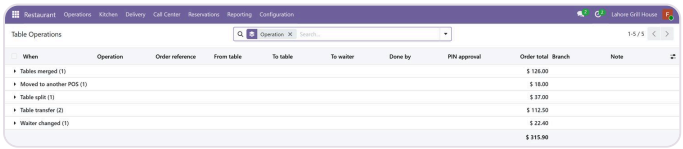

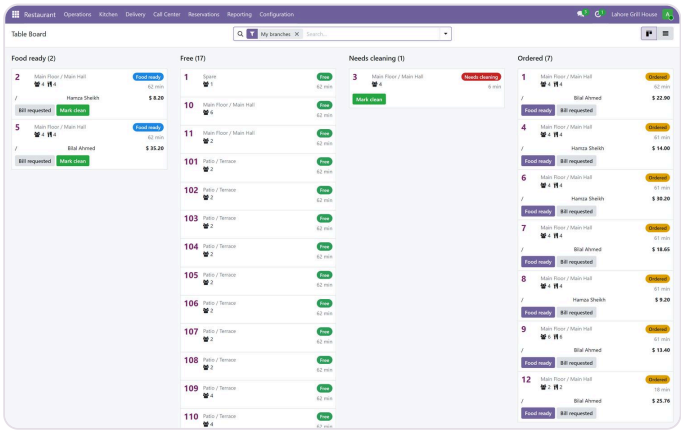

TABLE OPS Reporting, Table Operations: every transfer, merge, split and waiter change with its approval.

ORDER TAKER Operations, Table Board: every table by state, with Food ready, Bill requested and Mark clean.

PART 7 The cashier: payments, receipts and closing

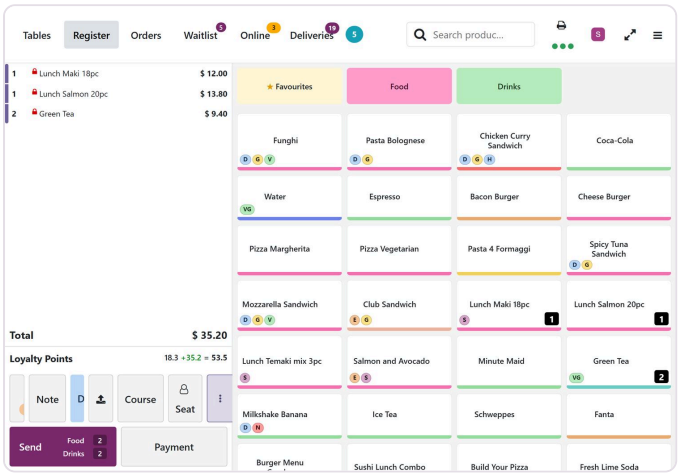

The cashier takes the money and closes the day. Cash, card, mobile wallets and bank transfers are all recorded with what is needed to check them later, the receipt carries the tax authority's number, and the drawer is counted note by note.

IN THIS PART YOU WILL LEARN

- How cash, card and wallet payments are taken and recorded
- Everything printed on the receipt and why
- How staff clock in
- How the day is closed and the cash counted

TRY IT YOURSELF ON THE DEMO

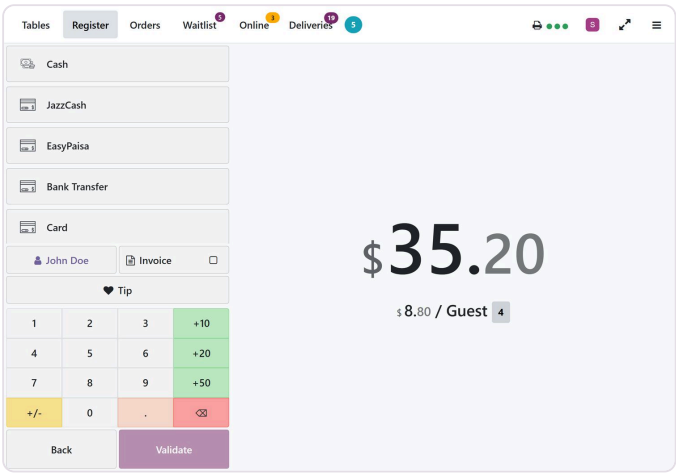

1. As the cashier, open table 5, Payment, JazzCash, and look at the merchant QR; Cancel.
2. Pay the table in cash and look at the receipt screen.
3. Open Reporting, Day Reports and open a Z report of an earlier day.

1 ODOO POS

Open the table to pay

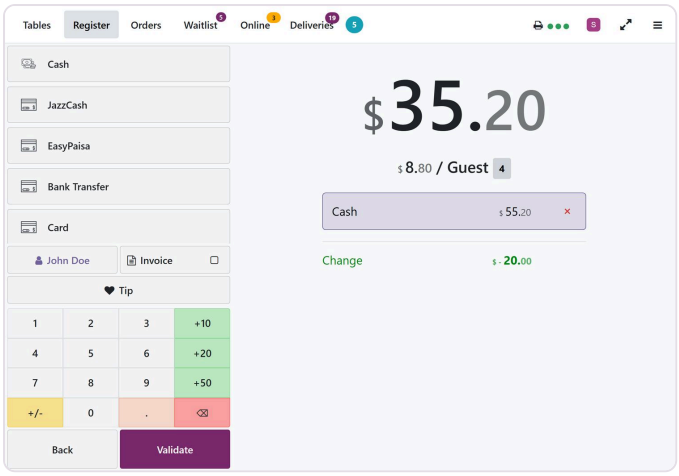

Open the table. The order shows its lines, the customer if one is set, and loyalty points the guest will earn.

2 ODOO POS WALLET PAYMENTS

The payment screen

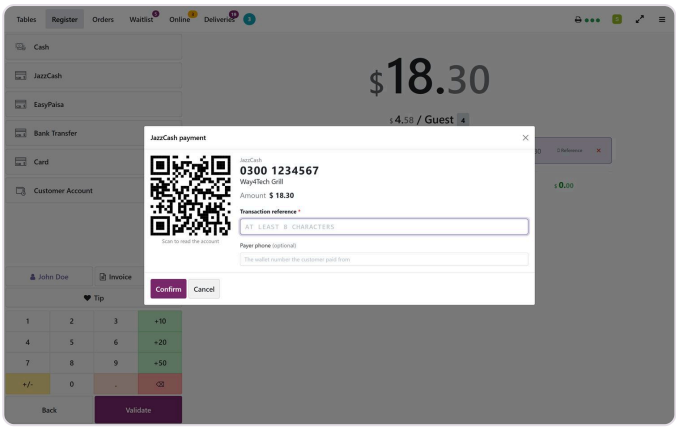

Total, amount per guest, and the payment methods of this register: Cash, JazzCash, EasyPaisa, Bank Transfer, Card, Customer Account. Tip and Invoice are here too.

3 ODOO POS

Cash with change

Tap Cash, tap the notes received (+10, +20, +50) or type the amount. The change is shown. **Validate**.

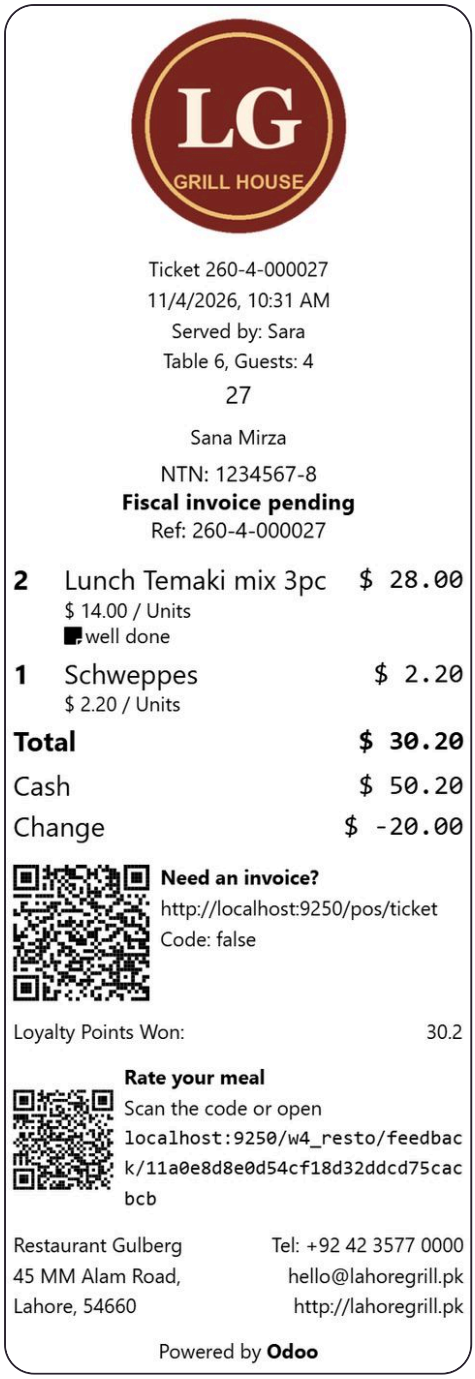

4 WALLET PAYMENTS

Mobile wallet

Tap JazzCash. A window shows the merchant account and a large QR for the guest to pay from their app. Type the transaction reference from the guest's screen. Validate is refused until the reference is there.

A reference used before on the same wallet is flagged with the earlier order: the usual cause is an old screenshot.

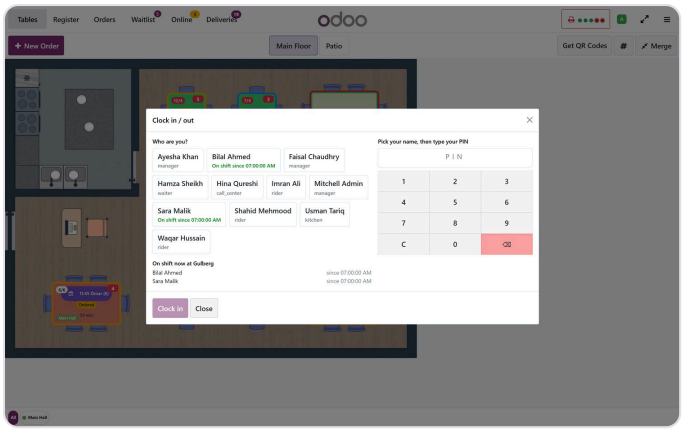

What the receipt carries

- The restaurant logo, ticket number, time, the cashier, the table and the number of guests.
- The guest and their tax number (NTN) when set.
- The fiscal block: the FBR invoice number and QR, or "Fiscal invoice pending" with the reference while the authority is offline.
- Each dish, its unit price and its note (here "nut allergy at the table").
- The payment and change, with the wallet reference under a wallet payment.
- A QR to request a proper invoice.
- Loyalty points won.
- **Rate your meal**: a QR to a one-page rating form on the guest's phone (Part 15).

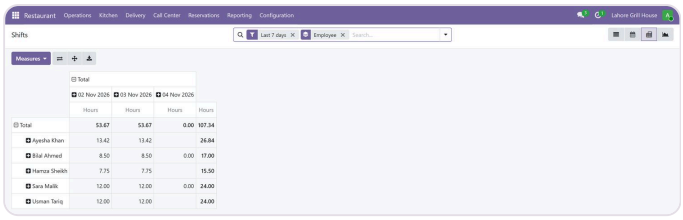

This is the real image the print server received for table 3. It prints the same in Urdu or Arabic, because it is sent as a picture.

Clock in and out BASE

Staff clock in at the till: menu, **Clock in / out**, tap your name, type your PIN. "Bilal clocked in at 11:02". A shift forgotten open is closed by itself after 16 hours, and a manager can fix the times; the change is marked "Edited by hand". **Reporting, Shifts** shows hours per person per day. With Odoo's Attendance app installed, every punch also goes there.

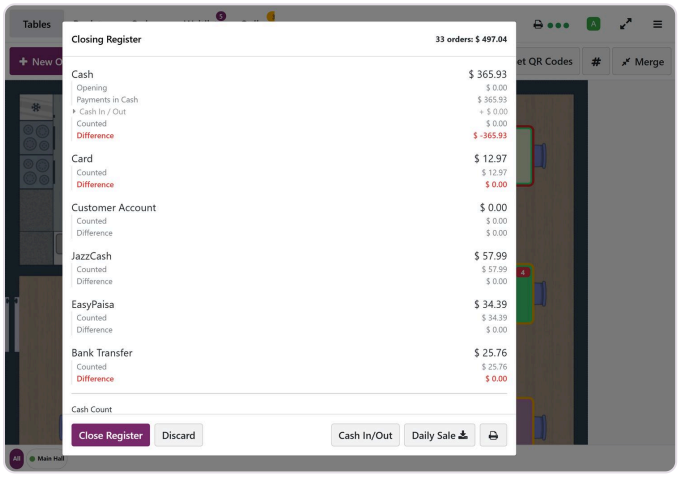

BASE Clock in / out at the till, with who is on shift now.

BASE Reporting, Shifts: hours per person and day.

Closing the day ODOO POS REPORTS

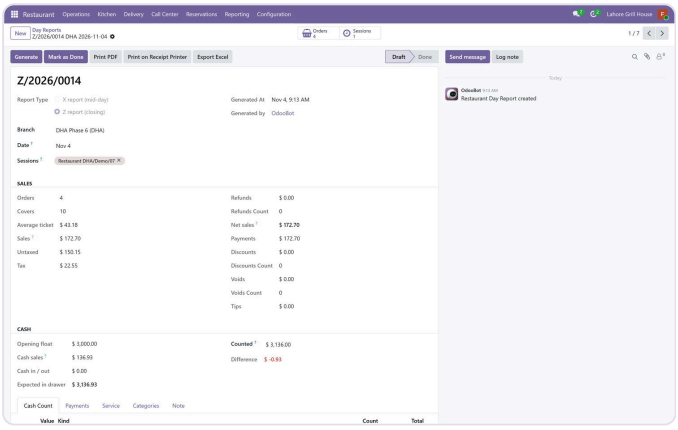

5 ODOO POS

Close the register

Menu, **Close Register**. For each payment method: what the system expects, what was counted, and the difference. Count the cash in the drawer and type it; wallets and cards are checked against their reports.

The red differences in the picture are because nothing has been counted yet.

6 REPORTS

The Z report

Closing creates the branch's **Z report** by itself: sales, tax, refunds, net sales, payments by method, orders and covers, discounts, voids, tips, sales by service and category, and the cash side: float, cash sales, cash in and out, expected, counted note by note, difference. Mark as Done freezes it; only an owner can reopen it.

An X report is the same thing during the day, without closing.

HOW IT WORKS

the cash count works

Expected in drawer = opening float + cash payments (after change) + cash put in − cash taken out.

Counted is typed by denomination (5000 × 3, 1000 × 12, ...) or as one figure. **Difference** = counted − expected. Cash in and out during the day always needs a manager PIN, so every movement of the drawer has a name on it.

PART 8 The kitchen

KITCHEN DISPLAY

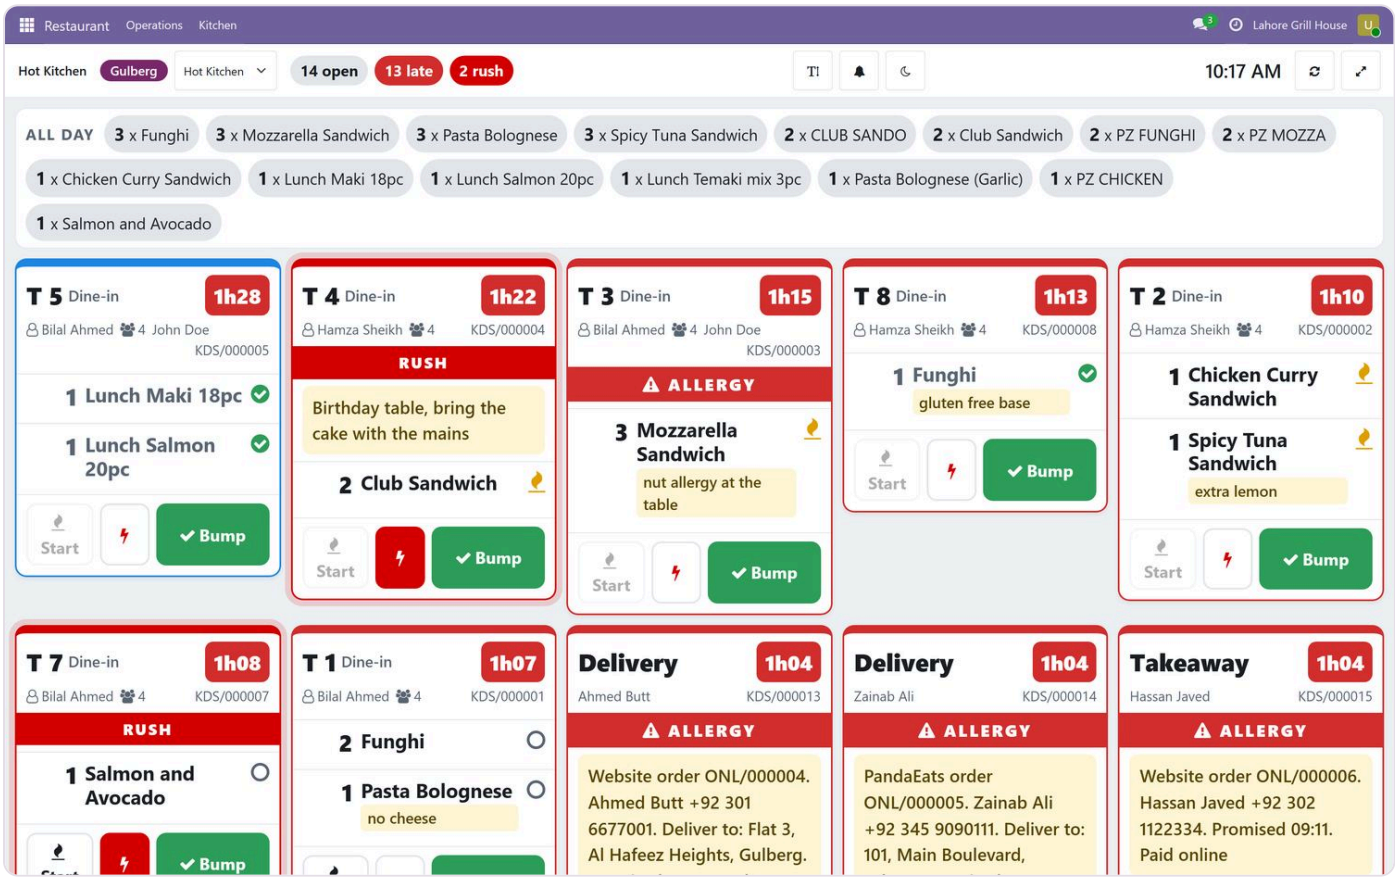

Standard Odoo Community has no kitchen screen; this module is a full one. Each station sees only what it cooks, every ticket has a timer, and the waiter knows the moment the food is ready. Kitchens that prefer paper keep their printers, or use both.

IN THIS PART YOU WILL LEARN

- How cooks work tickets on a screen: start, bump, recall, rush
- What the expo sees
- How dishes are routed to stations
- How kitchen speed is measured

TRY IT YOURSELF ON THE DEMO

1. Log in as the kitchen, open Kitchen, Station Display, Hot Kitchen, and bump a ticket.
2. Open Expo and see the per-station pills.
3. Open Reporting, Kitchen Times grouped by station.

KITCHEN DISPLAY The Hot Kitchen screen: one card per ticket, coloured by age, with table, waiter, guests, course, seat and options.

1 KITCHEN DISPLAY

Open the screen

On the kitchen tablet: **Restaurant, Kitchen, Station Display**, pick the station once (the tablet remembers it) and go full screen. The cook logs in with the Kitchen role; no register is needed.

2 KITCHEN DISPLAY

Work a ticket

Tap a line to mark it preparing, tap again for ready. **Start** moves the whole ticket to preparing. **Bump** finishes it at this station; it moves to the Done strip where **Recall** brings it back if bumped by mistake.

3 KITCHEN DISPLAY

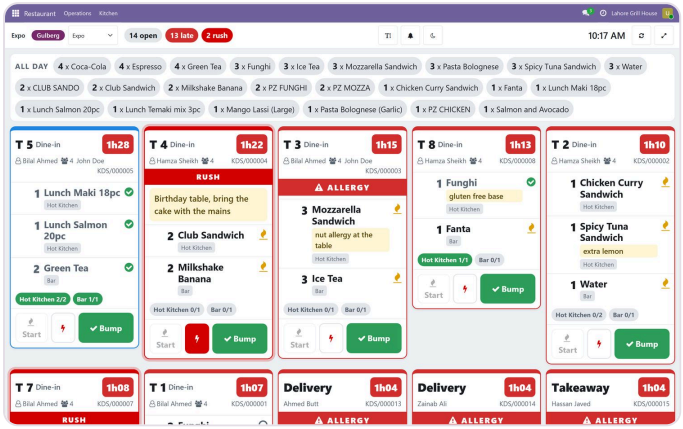

Rush, allergies and changes

Rush makes the card pulse red on every screen. ALLERGY and RECALLED banners show at the top. A dish removed after sending is struck through in red; one removed after it was bumped raises a VOID notice.

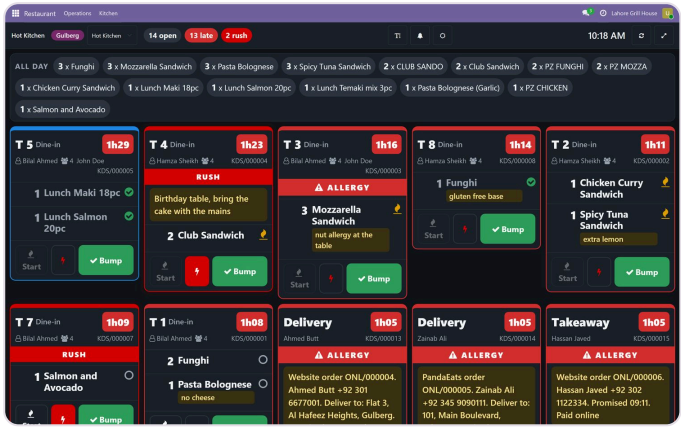

4 KITCHEN DISPLAY ORDER TAKER

Held courses

A course on hold shows dimmed with HOLD at the end of the grid. When the waiter fires it, its timer starts.

KITCHEN DISPLAY Expo: every ticket with a pill per station showing which are done.

KITCHEN DISPLAY Dark mode for a hot, bright kitchen, with larger text.

From the table to the pass KITCHEN DISPLAY

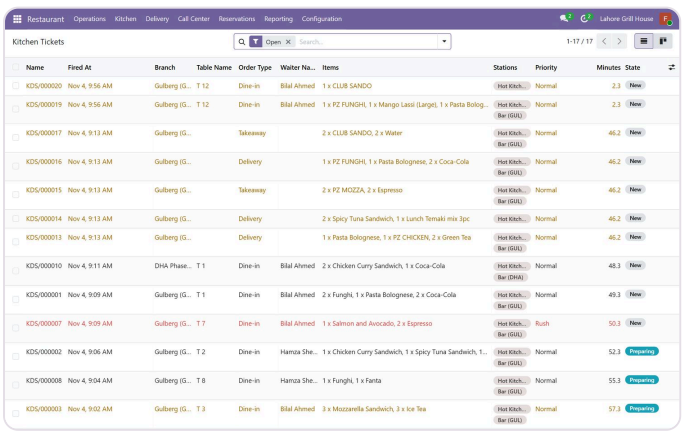

1. **Waiter sends** lines split by station
2. **Stations cook** timer: green, amber, red
3. **Station bumps** its part is done
4. **Expo bumps** the whole ticket
5. **Waiter alerted** table turns Food ready

HOW IT WORKS

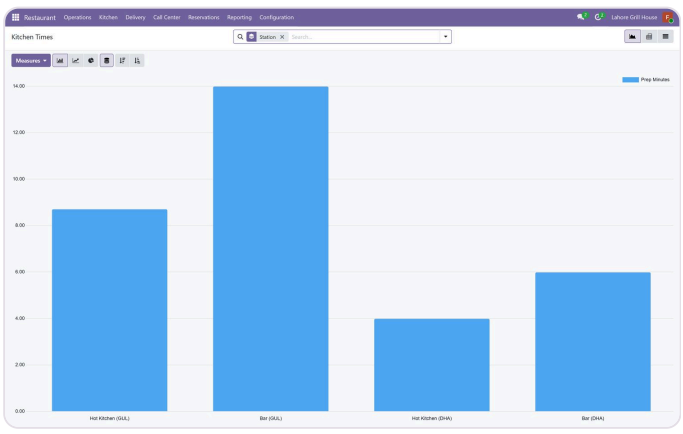

which station gets which dish

Each station lists the POS categories it cooks. A dish goes to every station whose categories include the dish's category or its parent: Food to the Hot Kitchen, Drinks to the Bar. A station with no category takes everything; Expo sees all. A station can also be limited to dine-in, takeaway or delivery orders.

The ticket is **ready** when every station has bumped its part: then the branch hears it, the waiter gets the alert and, for a delivery, the delivery turns Ready on the board (Part 9).

KITCHEN DISPLAY Kitchen, Tickets: every ticket with stations, priority, minutes and state.

KITCHEN DISPLAY Reporting, Kitchen Times: preparation minutes per dish, station and hour, and how many were late.

PART 9 Delivery and riders

DELIVERY

A delivery order is cooked like any other, then it has to find a rider, reach the door on time and bring the cash back. The module decides which branch delivers, what the fee is, who takes it, and checks every rupee the rider hands over.

IN THIS PART YOU WILL LEARN

- How delivery zones and routing pick the branch and the fee
- How a cashier dispatches from the till
- What the rider does on the phone
- How rider cash is counted and matched

TRY IT YOURSELF ON THE DEMO

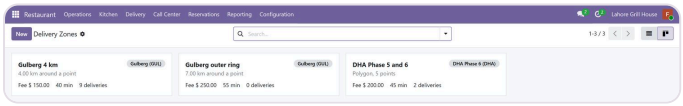

1. As the cashier, open the Deliveries page in the Gulberg till and assign a Ready delivery with Auto.
2. Log in as the rider on a phone and open My Deliveries.
3. As the manager, open Delivery, Cash Settlements and read a settlement.

A delivery from order to cash DELIVERY

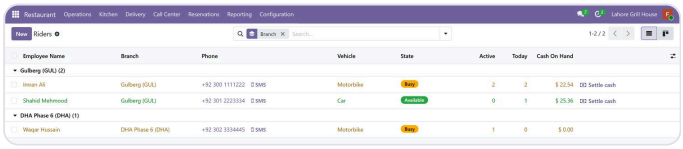

1. **Order** — Delivery preset + customer
2. **Kitchen** — ticket ready = delivery Ready
3. **Assign** — auto or by hand
4. **Out** — rider picks up
5. **Delivered** — cash counted at the door
6. **Settle** — rider hands cash to cashier

Setup: zones and riders DELIVERY

Restaurant, Configuration, Delivery Zones. A zone is a circle around the branch (radius in km) or a polygon drawn from map points, with its delivery fee, minimum order, promised time and delivery hours. Where zones overlap, a priority decides. **Restaurant, Delivery, Riders:** one rider per employee, with phone, vehicle and branch; give them a login with the Rider role.

DELIVERY Zones: Gulberg 4 km (circle), outer ring, and the DHA polygon, each with fee, minimum and time.

DELIVERY Riders: load, deliveries today, cash on hand, last known position.

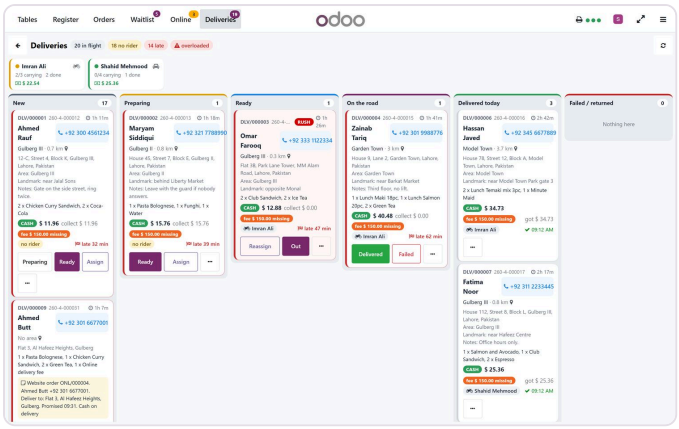

HOW IT WORKS

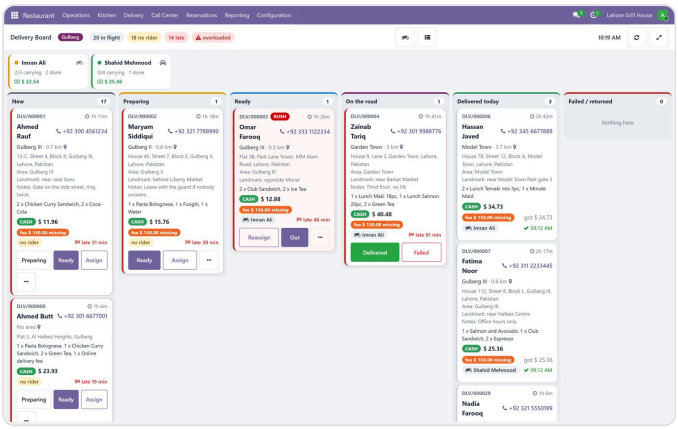

which branch delivers

The customer's address is turned into coordinates (OpenStreetMap by default, Google optional, or typed by hand). The branch whose zone contains the point wins; if several do, open branches come first, then zone priority, then the branch with fewer deliveries in flight, then the nearest. An overloaded branch (more deliveries out than the threshold in Settings) passes the order to the next one.

A polygon zone is checked point by point, so "DHA Phase 5 and 6" covers exactly that area, not a circle that spills into the next one. The call center and online orders use the same routing.

Dispatch from the till DELIVERY

1 DELIVERY

The Deliveries page in the POS

The cashier never leaves the till: **Deliveries** in the top bar opens six columns, New, Preparing, Ready, On the road, Delivered today, Failed. The rider strip at the top shows each rider's load and cash. Each card has the customer, tap-to-call phone, area, address with landmark, items, total, cash to collect, ETA and a late flag.

When a delivery turns Ready while the cashier is elsewhere, the till rings.

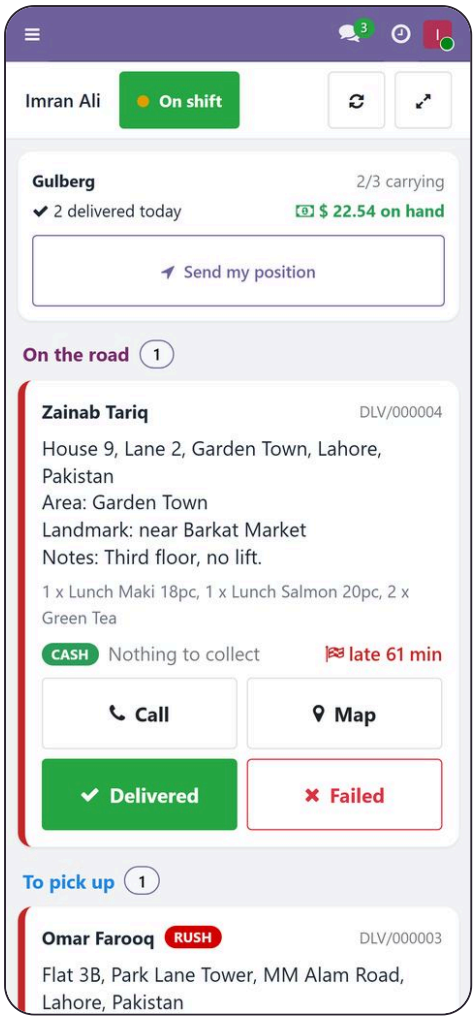

2 DELIVERY

The backend board

The same board for a manager or dispatcher at a desk: **Restaurant, Delivery, Board**, live for the chosen branch.

BUTTON	WHAT IT DOES
Assign	Pick a rider from the list with their load, or **Auto**: the least loaded rider with room, the nearest on a tie.
Out	The rider has the food. The ETA keeps counting to the time promised to the customer.
Delivered	Opens the cash window: order total, cash due, and a short or over hint.
Failed	With a reason chip (no answer, wrong address, refused...). Try again sends it out once more.
More	Open the order in the till, Rush, Transfer to another branch, Unassign rider, Cancel delivery.

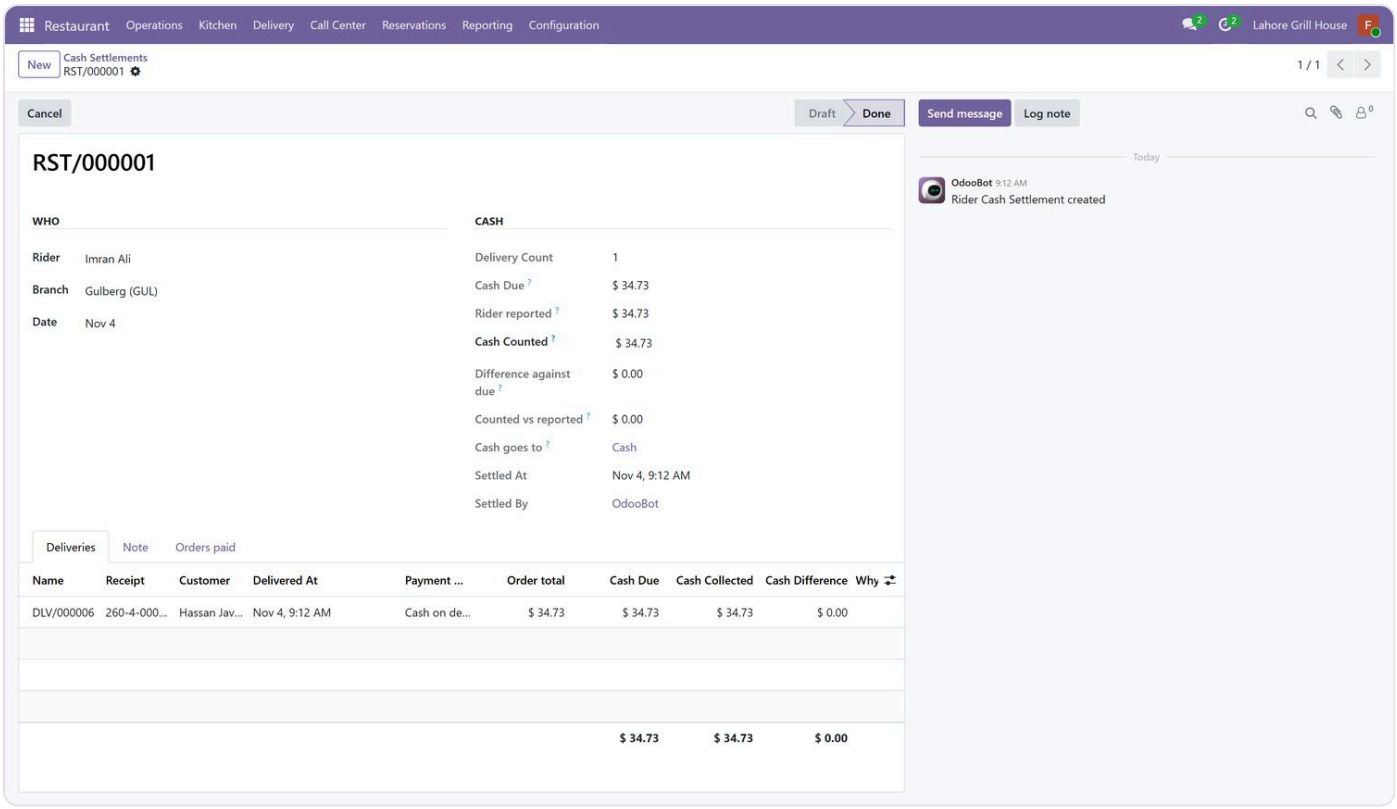

The rider’s phone DELIVERY

Restaurant, Delivery, My Deliveries on the rider's phone.

- One column, big buttons (60 px), made for a glove and a moving bike.
- **Picked up**, **Delivered** (with the cash count), **Failed** (reason), **Back at the branch**.
- **Call** opens the dialer, **Map** opens directions in the maps app.
- **On shift** switch; going off shift with food in hand is refused.
- **Send my position** records where the rider is, for the board and for the dispatcher.

Settling the rider's cash DELIVERY

DELIVERY A cash settlement: every cash delivery of the rider, what was due, what the rider reported, what was counted, and the difference.

HOW IT WORKS

rider cash is checked

Four numbers are kept apart: the **order total**, the **cash due** at the door (total less anything paid before), the cash the rider **says** they collected, and the cash **counted** at the branch. When the rider comes back, **Riders, Settle cash** opens a count with every unsettled cash delivery. The cashier types what was counted; a shortfall needs a note. Confirming pays each cash-on-delivery order into the till's cash method, once.

An order paid online or by card carries no cash: typing cash on it is refused.

PART 10 Online orders

ONLINE ORDERS

The restaurant's website, its app and partners like Foodpanda all send orders here. Each one lands in one inbox and in the till, goes to the kitchen like any order, and the channel is told at every step.

IN THIS PART YOU WILL LEARN

- What the online orders module does and what the restaurant's website still does
- How to set up a channel
- How orders are accepted, matched and sent to the kitchen

TRY IT YOURSELF ON THE DEMO

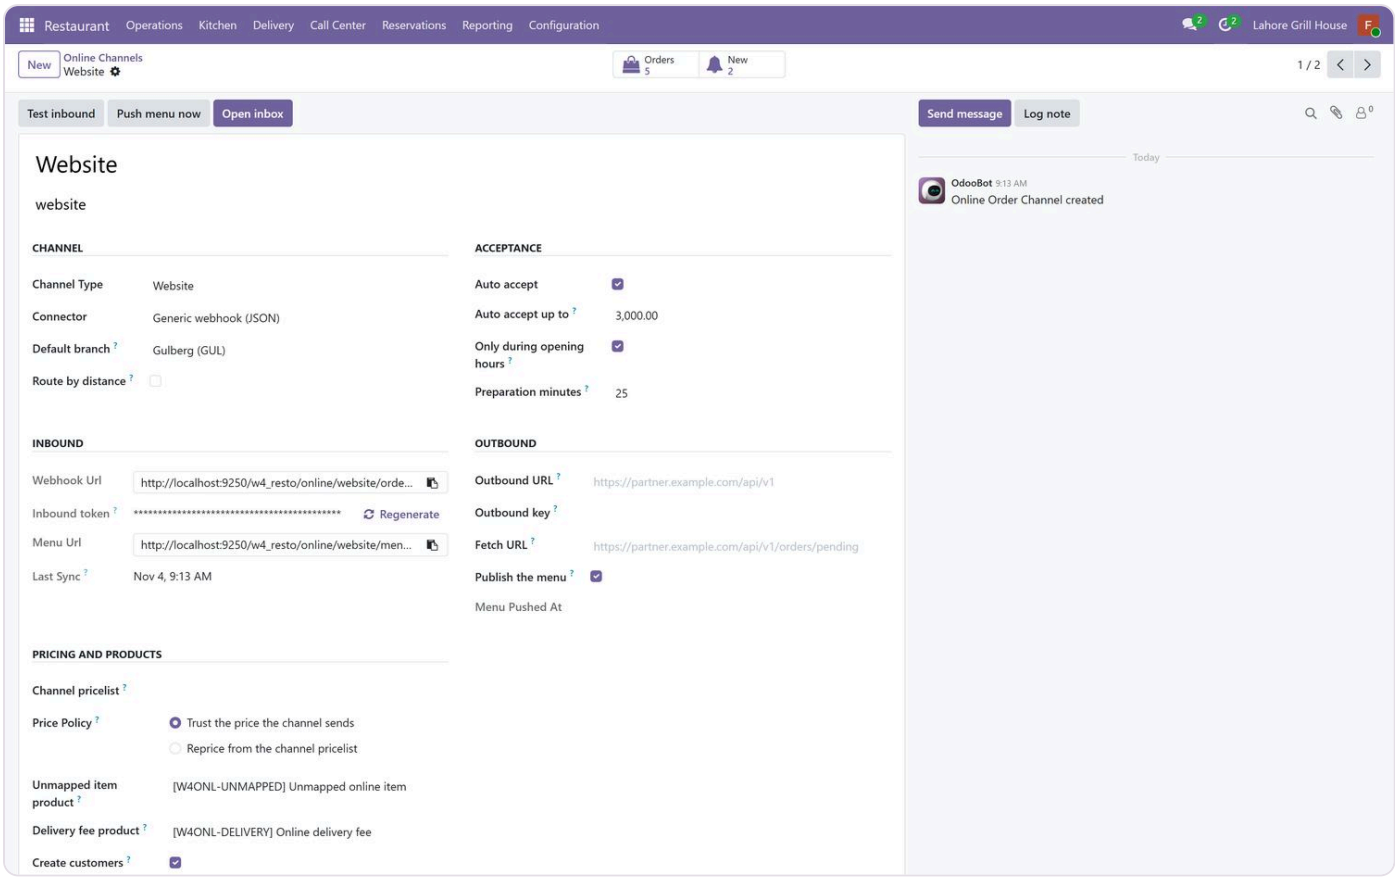

1. As the owner, open Configuration, Online Channels, Website, and press Test inbound.
2. As the cashier, open Online in the Gulberg till and accept the new order.
3. Open the order in Operations, Online Order List and read its raw payload tab.

What this module is, and is not. It is the restaurant side: it receives orders from any channel and runs them through the kitchen, the till and the riders. The page where customers browse the menu and check out is the restaurant's website or app. If the restaurant has one, its developer connects it to the channel link below. If not, Way4Tech builds the ordering page as a separate project; it reads the menu and prices from this module, so it always matches.

An online order ONLINE ORDERS

1. **Customer orders** — website, app, Foodpanda
2. **Channel link** — order arrives in a second
3. **Inbox rings** — backend and till
4. **Accept** — by hand or auto
5. **Kitchen** — ticket like any order
6. **Ready, done** — channel told each step

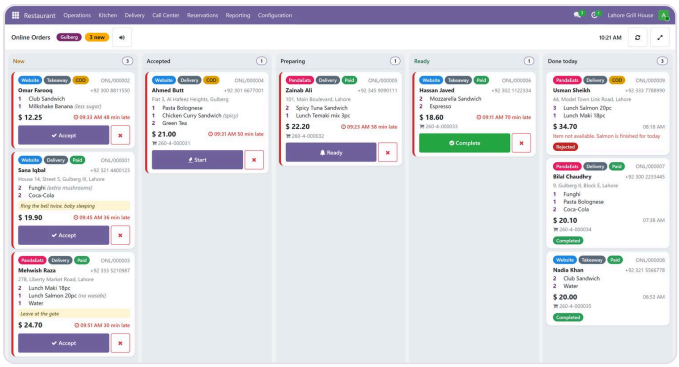

Setup: one channel per source ONLINE ORDERS

ONLINE ORDERS Restaurant, Configuration, Online Channels: the Website channel with its links, acceptance rules and outbound settings.

FIELD	WHAT IT MEANS
Connector	The format orders arrive in: Generic (your own website or app) or Foodpanda style.
Default branch, store mapping	Which branch gets the order; a channel serving several branches maps its store ids to branches.
Route by distance	Send the order to the branch whose delivery zone covers the address (Part 9).
Webhook URL	The link the website posts orders to. The token in it is the password; Regenerate makes a new one if it leaks.
Menu URL	The website reads the live menu, prices and sold-out items from this link.
Auto accept, preparation minutes	Accept without a person (up to an amount, only in opening hours), and the time promised.
Outbound URL, key, fetch URL	Only for a partner that wants status updates sent back, or that must be polled for orders.
Publish the menu	The menu is sent to the channel every 15 minutes and on Push menu now; an 86'd dish shows as unavailable.

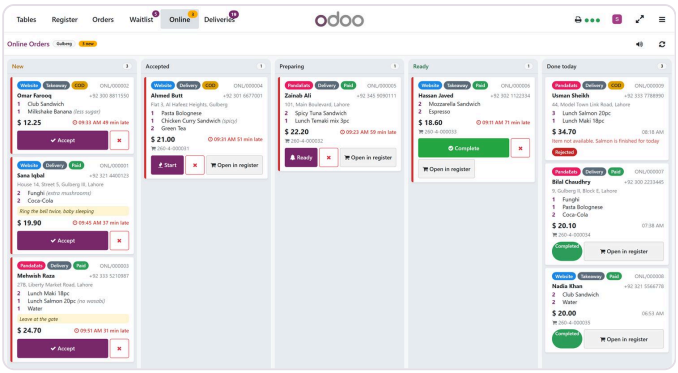

Running it ONLINE ORDERS

1 ONLINE ORDERS

The inbox

Restaurant, Operations, Online Orders. Five columns, New, Accepted, Preparing, Ready, Done today, for one branch, live. A bell rings on every new order. Each card: channel, delivery or takeaway, paid or cash on delivery, customer, items, total and a countdown to the promised time.

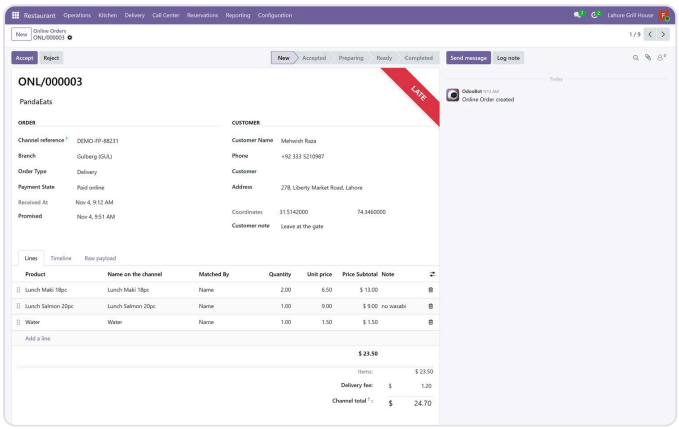

2 ONLINE ORDERS

The same inbox in the till

The **Online** button in the till's top bar carries the count of orders waiting. Accept sends the order to the till and the kitchen; Reject asks for a reason from a set of chips, plus details for the customer.

Waiters see the page read only; cashiers and managers act.

3 ONLINE ORDERS

An online order

The order as received: the channel's reference, matched dishes, the channel total, the till total and any difference, the raw message from the channel, and in the chatter every status sent back.

HOW IT WORKS

an incoming order is matched

Each line is matched to a dish by its code (SKU), then by exact name; anything else becomes an "unmapped item" line that keeps the channel's name, so nothing is lost. The same order sent twice is recognised and not created twice. The customer is found by phone or created. Accepting creates a draft order in the branch's open till, priced and taxed the way the till would; with no till open, it waits as accepted and drops in the moment one opens.

Paying the order at the till completes it online; cancelling it at the till cancels it online.

Showing it in a demo ONLINE ORDERS

1. Open the channel and press **Test inbound**: a sample order arrives in the inbox and the till rings.
2. Accept it in the till and open the kitchen screen: the ticket is there. Mark a dish 86 and press **Push menu now**: the menu link shows it unavailable.

PART 11 The call center

CALL CENTER

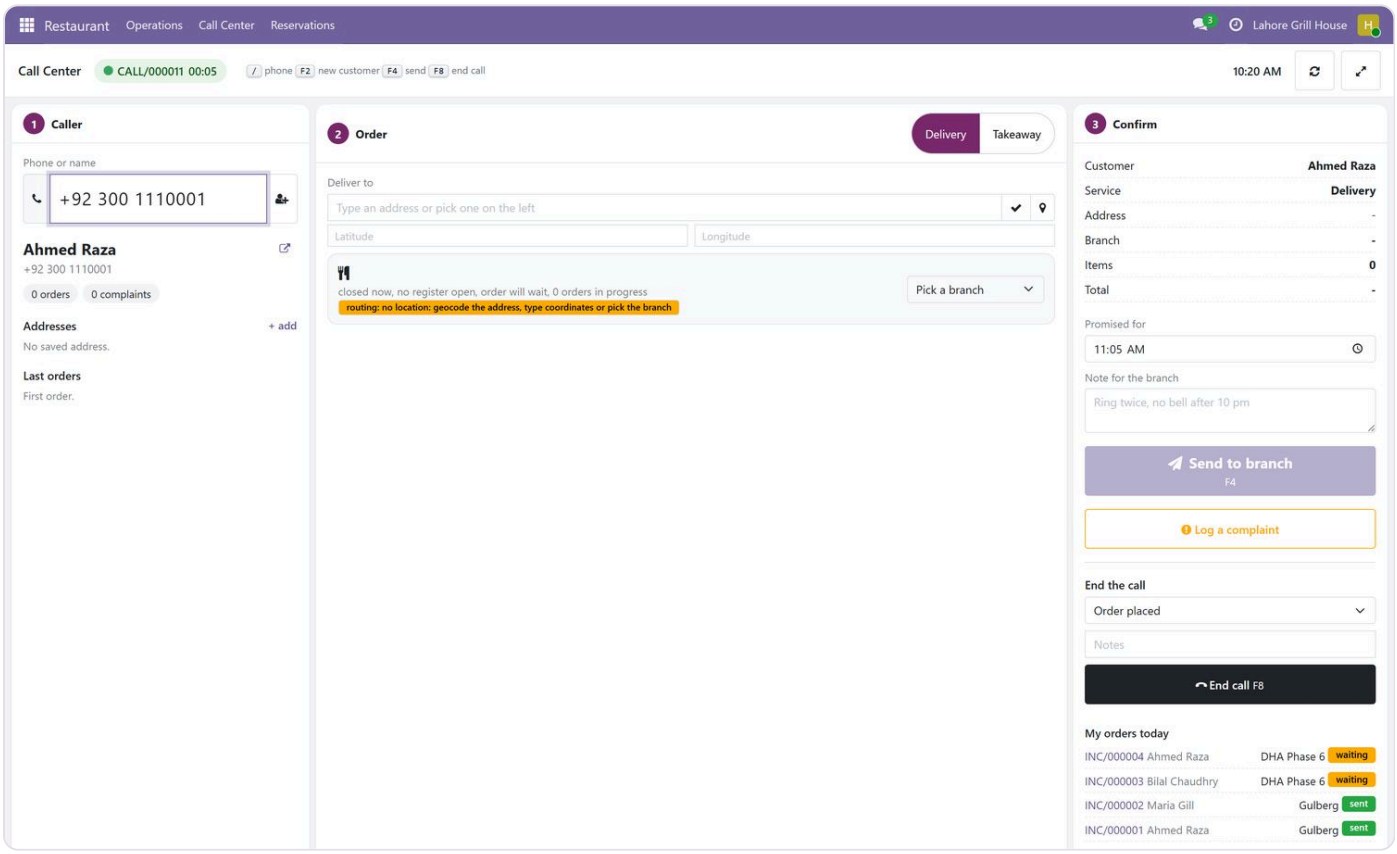

A chain with several branches often has one phone number. Agents take the call, find the customer, see which branch should cook, take the order at that branch's prices and send it straight to its till. The supervisor sees the whole floor.

IN THIS PART YOU WILL LEARN

- How an agent takes a phone order for the right branch
- How the console finds customers and reorders
- What the supervisor and complaints screens show

TRY IT YOURSELF ON THE DEMO

1. As the agent, open Call Center, Agent Console and type 0300 to find a customer.
2. Use Reorder on a past order and send it to Gulberg; watch the Gulberg till ring.
3. Log a complaint and find it under Call Center, Complaints.

CALL CENTER The agent console: caller and history on the left, the order with the routed branch in the middle, the confirmation on the right.

1 CALL CENTER

Find the caller

Type the phone number or a name; matches appear as you type. The customer card shows saved addresses, the last five orders with **Reorder**, and open complaints. Enter on no match opens a new customer.

Linked to the phone system, the console pops the caller by itself (telephony webhook).

2 CALL CENTER DELIVERY

Pick the address, see the branch

The branch whose zone covers the address is chosen, with its distance, opening hours and whether its till is open. The agent can override it, with a reason that is logged.

3 CALL CENTER MENU

Take the order

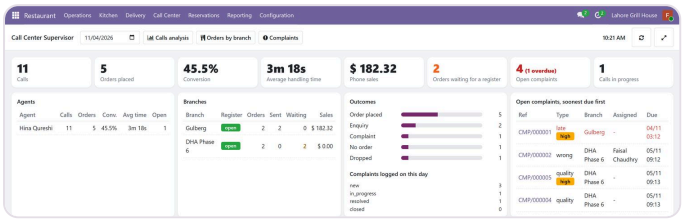

The branch's own menu at its prices, category chips, options, notes per line, live totals. Sold-out dishes are greyed.

4 CALL CENTER KITCHEN DISPLAY DELIVERY

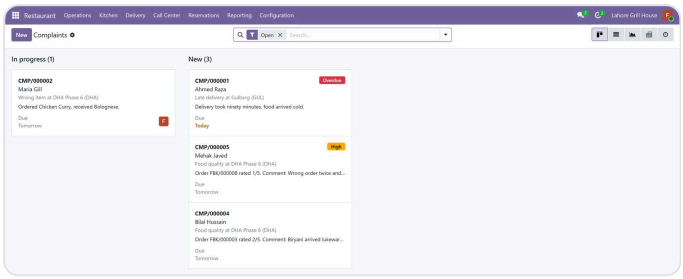

Send and follow

Send (F4). The branch till receives a draft order and rings; the status strip follows it: at the register, in the kitchen, paid, out for delivery. End the call (F8) with its outcome.

Keys: / or F1 phone box, F2 new customer, F4 send, F8 end call.

CALL CENTER Supervisor: calls, orders, conversion, handling time, per agent and branch, open complaints.

CALL CENTER Complaints by state, with category, severity and a due time from the SLA.

PART 12 Reservations and the waitlist

RESERVATIONS

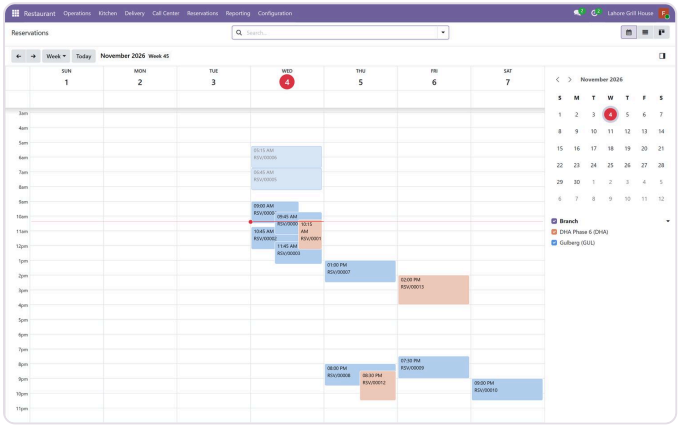

Bookings hold tables for a time and remind the guest; walk-ins wait in a fair queue with a quoted time. The host works from the till they already have, and the floor plan shows what is booked before the guests arrive.

IN THIS PART YOU WILL LEARN

- How bookings are made, confirmed and reminded
- How the walk-in waitlist works from the till
- The rules that prevent double booking

TRY IT YOURSELF ON THE DEMO

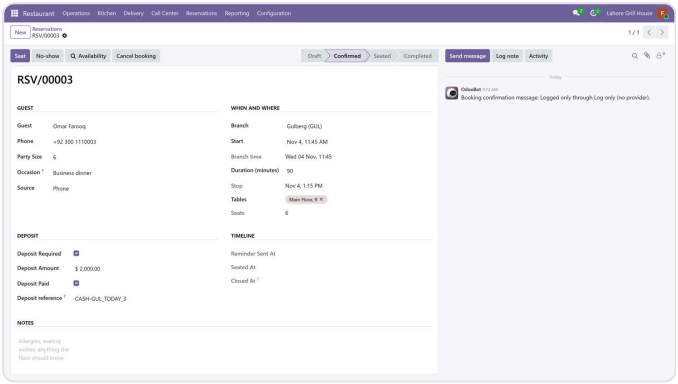

1. As the waiter, open Waitlist in the Gulberg till, Add party, then Seat them.
2. As the manager, open Reservations, Calendar, make a booking for 4 people and press Availability.

1 RESERVATIONS

The booking calendar

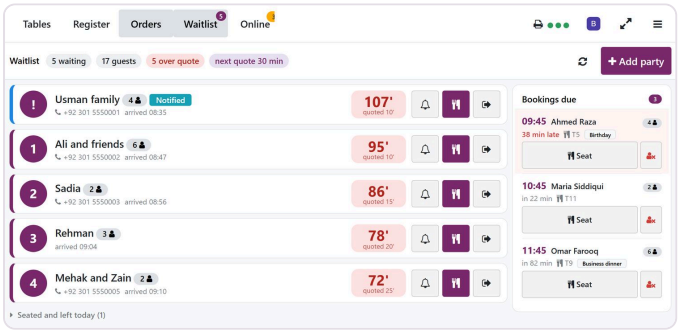

Restaurant, Reservations, Calendar: a week coloured by branch; also list and kanban by status.

2 RESERVATIONS

A booking

Guest, party size, time. **Availability** lists the free tables for the window with the smallest one that fits pre-ticked. **Confirm** sends the confirmation message; Seat, Complete, No-show and Cancel follow.

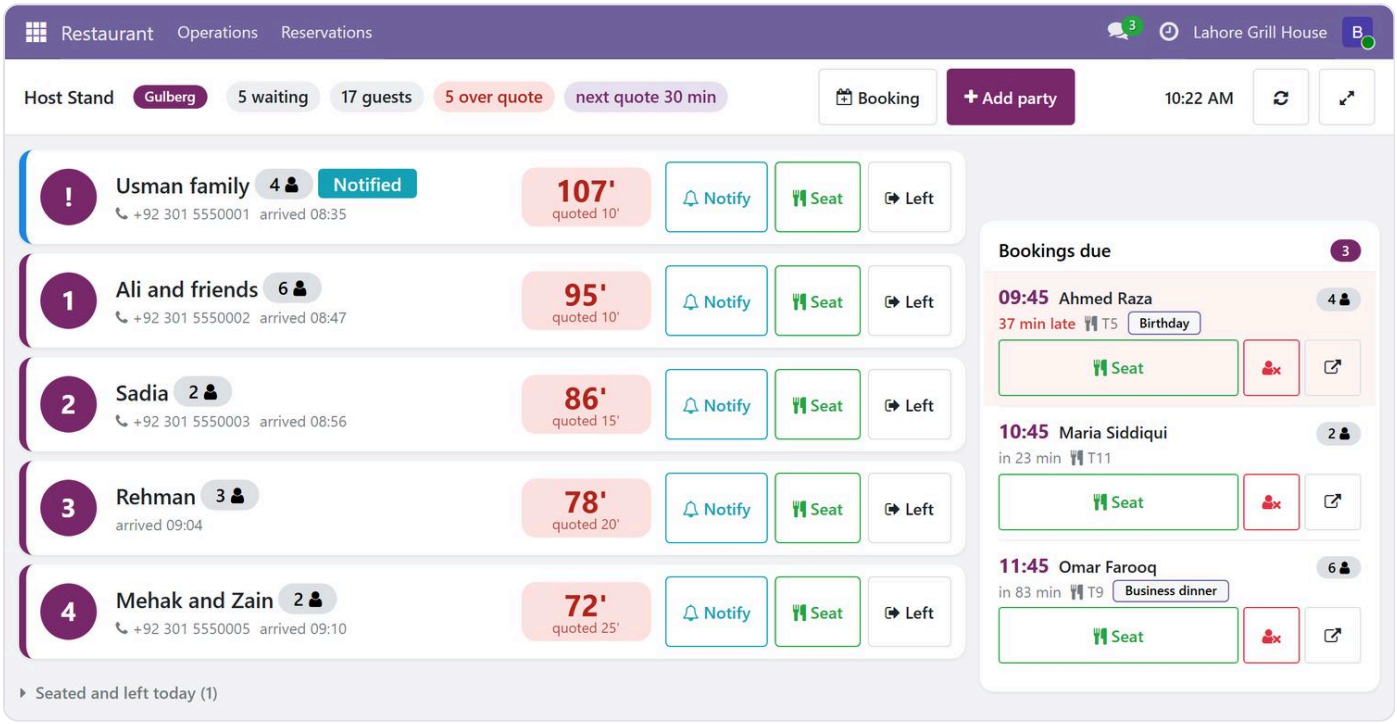

3 RESERVATIONS

The waitlist in the till

The **Waitlist** button opens the queue: position, party, phone, arrival time, and the real wait against the quoted wait in green, amber or red. **Add party** in three taps; **Notify** sends "your table is ready"; **Seat** opens a table picker with the best table pre-ticked. Bookings due in the next two hours sit beside the queue.

RULE	WHAT IT DOES
No double booking	Tables never overlap, with 15 minutes between bookings; the refusal names the other booking.
Party size	Larger than the seats warns; more than twice the seats is refused.
Reserved ring	30 minutes before, the tables turn Reserved on the floor plan with a chip "11:45 Omar (6)".
No-show	Released after the grace time (20 min). From three no-shows, the guest's next booking shows a warning.
Deposits	A branch or booking can require a deposit before confirming (recorded, with its reference).
Closed days	Configuration, Booking Blackouts: a private event or holiday refuses bookings.
Messages	Confirmation, reminder (3 hours before) and table-ready, by SMS or a WhatsApp webhook, or logged only.

RESERVATIONS The host stand on a tablet at the door, for a desk without a till.

PART 13 Branches working together

BRANCH TRANSFER

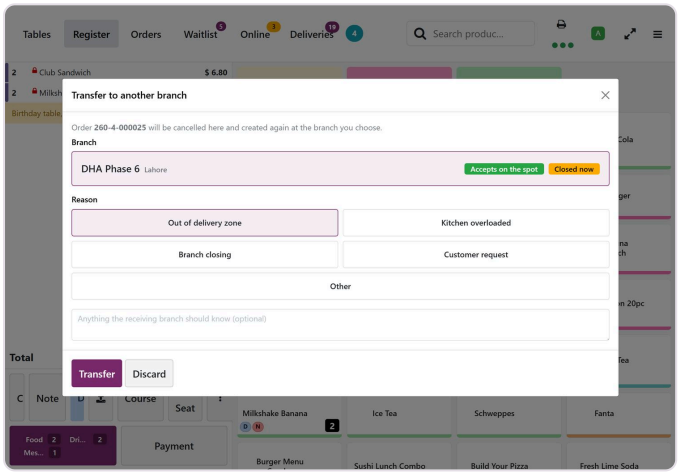

Branches of one restaurant help each other: an order taken at one branch can be cooked at another, and stock moves between their stores. The owner decides which branch the revenue belongs to (Settings, Branch Transfers: the branch that cooked it, or the one that took it); the rule is stored on each transfer, so changing it later never rewrites past months, and Reporting, Revenue by Branch shows the result.

IN THIS PART YOU WILL LEARN

- How an order moves to another branch and comes back if refused
- How stock moves between branch stores
- Which branch reports the revenue

TRY IT YOURSELF ON THE DEMO

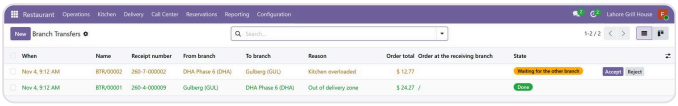

1. As the manager, open a Gulberg table, Actions, Transfer to branch, DHA, Kitchen overloaded.
2. Open Operations, Branch Transfers and follow it.

1 BRANCH TRANSFER

Send an order to another branch

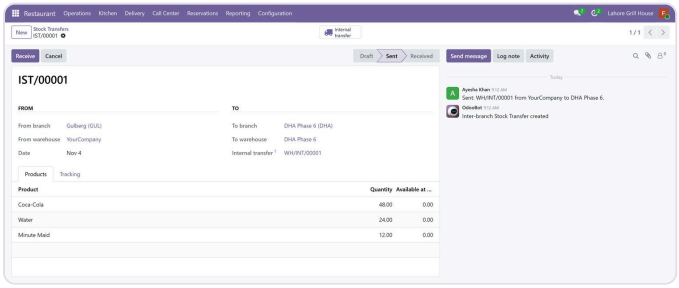

In the till: **Actions, Transfer to branch**, pick the branch, a reason (out of delivery zone, kitchen overloaded, branch closing, customer request) and a note. A manager PIN is asked if the register requires it.

2 BRANCH TRANSFER

The other branch accepts

The receiving managers get a notice and a to-do; they Accept or Reject under **Operations, Incoming Transfers**, or the branch accepts on the spot when set to. The new order is a copy line by line, checked to add up to the same total before it is created.

3 BRANCH TRANSFER INVENTORY

Move stock between stores

Operations, Stock Transfers: from one branch store to another. Send checks there is enough and reserves it; the receiving branch presses Receive.

PART 14 Recipes, stock and food cost

INVENTORY

Every dish has a recipe. When it is paid, its ingredients leave the branch store. Wastage is recorded, the shelves are counted, and the difference shows what left the kitchen without being sold. Every morning the reorder list is ready.

IN THIS PART YOU WILL LEARN

- How recipes deduct ingredients on every sale
- How wastage and counts are recorded
- How food cost and unexplained variance are calculated

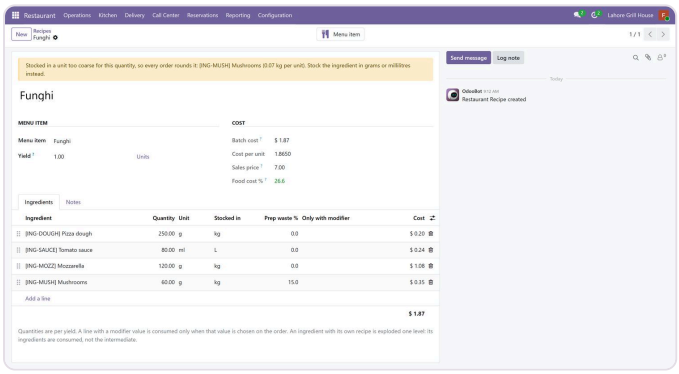

TRY IT YOURSELF ON THE DEMO

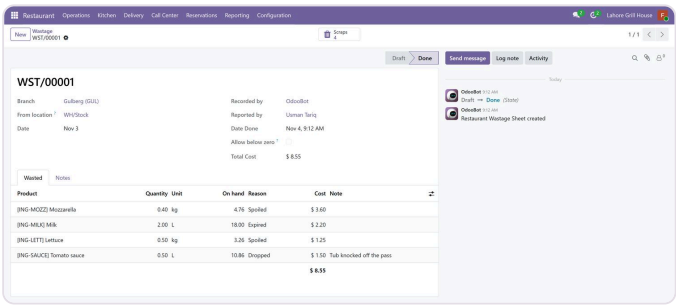

1. As the owner, open Configuration, Recipes and check the food cost % of each dish.
2. As the kitchen, create a wastage sheet with two lines; confirm it as the manager.
3. Open Reporting, Usage Variance for this month.

The stock loop

INVENTORY

1. **Recipe** grams per dish
2. **Sale** ingredients deducted
3. **Wastage** kitchen records it
4. **Count** shelves counted
5. **Variance** what is missing
6. **Reorder** par levels

1 INVENTORY

Recipes

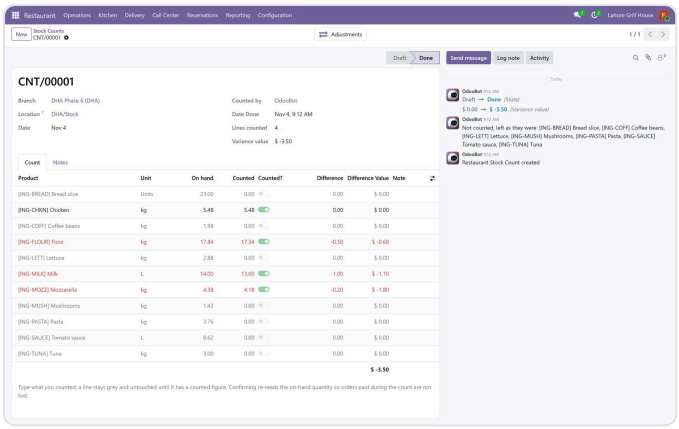

Restaurant, Configuration, Recipes. A recipe makes a number of portions from ingredient lines, in any unit (grams of a kilogram product), with a prep waste percentage. A line can belong to an option, so "Extra cheese" uses its own cheese. The form shows the cost per portion and the food cost % against the price.

A sauce or dough can have its own recipe: selling the pizza uses the flour, not the dough.

2 INVENTORY

Wastage

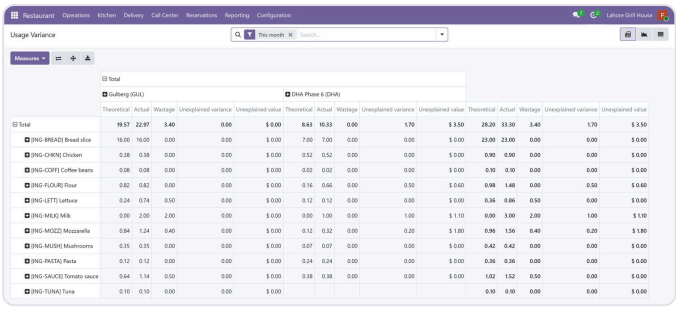

Operations, Wastage: one sheet per branch and day, lines with product, quantity and reason (expired, spoiled, preparation error, dropped). The kitchen fills it; a manager confirms it, and its cost is fixed at that moment.

3 INVENTORY

Stock counts

Operations, Stock Counts: Fill from stock lists every ingredient with what the system thinks is there. Type what is on the shelf; the difference and its value show as you type. Confirm corrects the stock.

4 INVENTORY

Usage variance

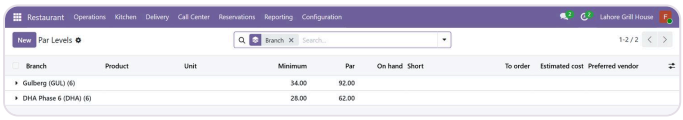

Reporting, Usage Variance: per ingredient, branch and day: what recipes used, what was wasted, what the count found missing, and the **unexplained variance** with its value. This is the number that finds theft and over-portioning.

HOW IT WORKS

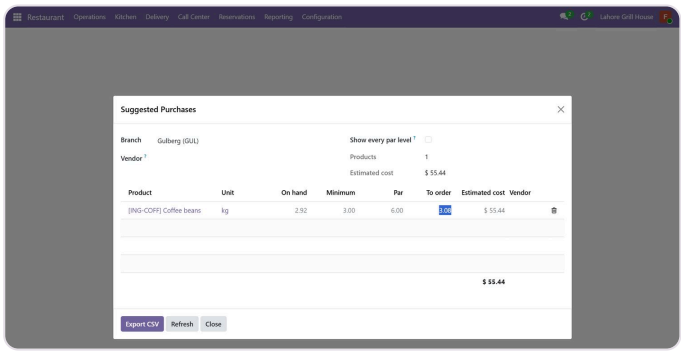

food cost and variance are worked out

Food cost % = ingredient cost of one portion ÷ selling price before tax. In the demo, Funghi costs 1.47 in ingredients and sells for 7.00: about 21%.

Unexplained variance = what the count found missing − what sales used − what was recorded as wasted. Recorded wastage is explained and shown in its own column; only the rest is a problem to investigate.

INVENTORY Par levels: minimum and par per ingredient and branch; short items in red.

INVENTORY Suggested purchases: what to order, how much, at what cost; RFQ or CSV.

Every morning each branch manager gets one to-do listing what is under its minimum. With Odoo Purchase installed, the suggested list becomes requests for quotation, one per supplier.

PART 15 Guests: loyalty and feedback

LOYALTY

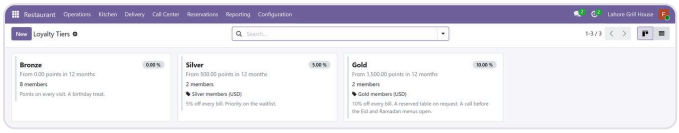

Regulars should feel known. Points, tiers with their own prices, a birthday coupon, and a QR on every receipt that asks how the meal was; a bad rating reaches the manager the same day.

IN THIS PART YOU WILL LEARN

- How tiers and their prices work
- How guests rate their meal from the receipt
- How bad ratings reach the manager

TRY IT YOURSELF ON THE DEMO

1. In the till, set the customer Ali Raza (Gold) on an order and watch the prices change.
2. Open Reporting, Guest Feedback and filter low ratings.

1 LOYALTY

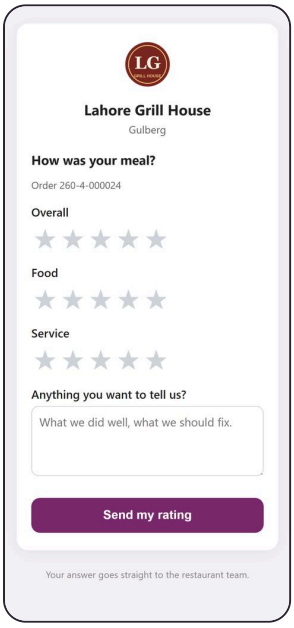

Tiers

Restaurant, Configuration, Loyalty Tiers: Bronze, Silver, Gold, each reached by points earned in the last 12 months, with a discount turned into a price list in one click. When a member is set on an order, their tier badge shows and their prices apply.

2 LOYALTY

Members by tier

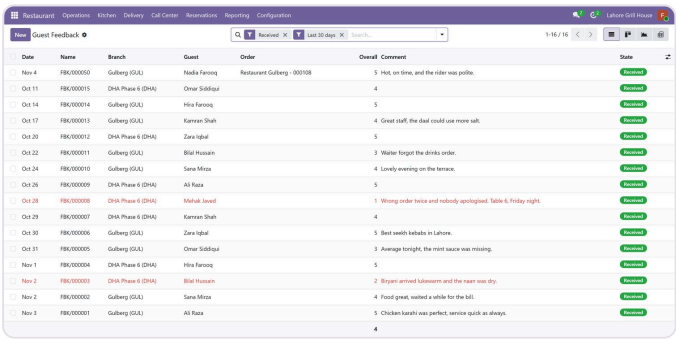

Operations, Loyalty Members: guests grouped by tier, with points and balance.

3 LOYALTY

Rate your meal

The QR on the receipt opens a small page on the guest's phone: overall, food and service stars, and a comment. No website needed.

4 LOYALTY

Feedback and alerts

Reporting, Guest Feedback by branch, waiter and day. A rating of 2 or less creates a to-do for the branch managers and, with the call center, a complaint.

ALSO INCLUDED	HOW IT WORKS
Points, eWallet, gift cards, coupons	Odoo's own loyalty programs; starter programs are created at install (1 point per 100 spent, 100 points = 5 off).
Birthday offer	A coupon a few days before the guest's birthday, once a year, valid 14 days, sent by message or noted on the contact.
Customer display	The guest's name, tier and points at the top of the screen facing them.

PART 16 Reports for the owner and the manager

REPORTS

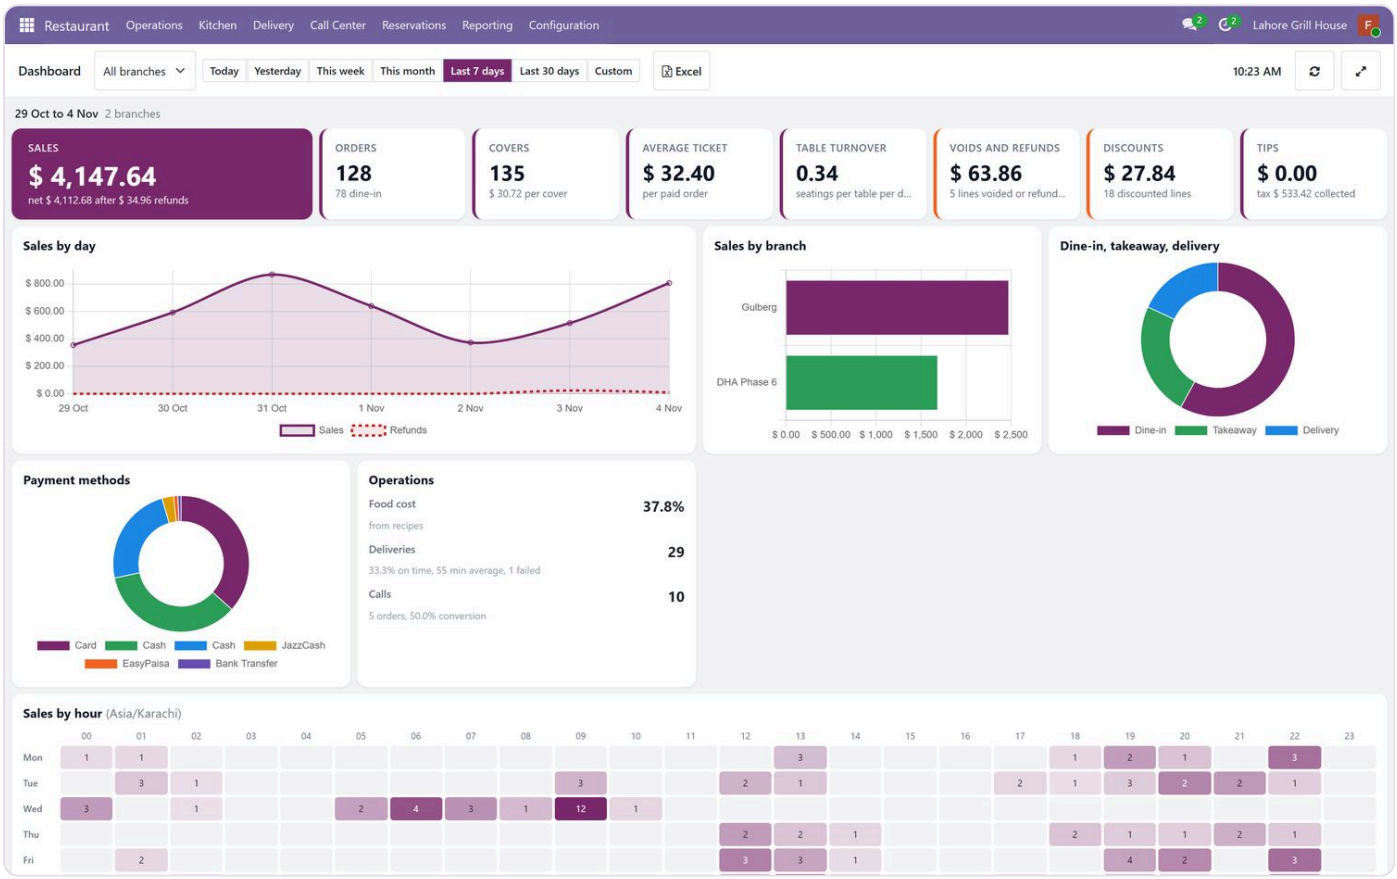

Everything above produces data. This part is where the owner reads it: one dashboard for the business, a day report per branch, and a report for every question a restaurant owner asks.

IN THIS PART YOU WILL LEARN

- What every number on the dashboard means
- How to read the menu engineering matrix
- Which report answers which question

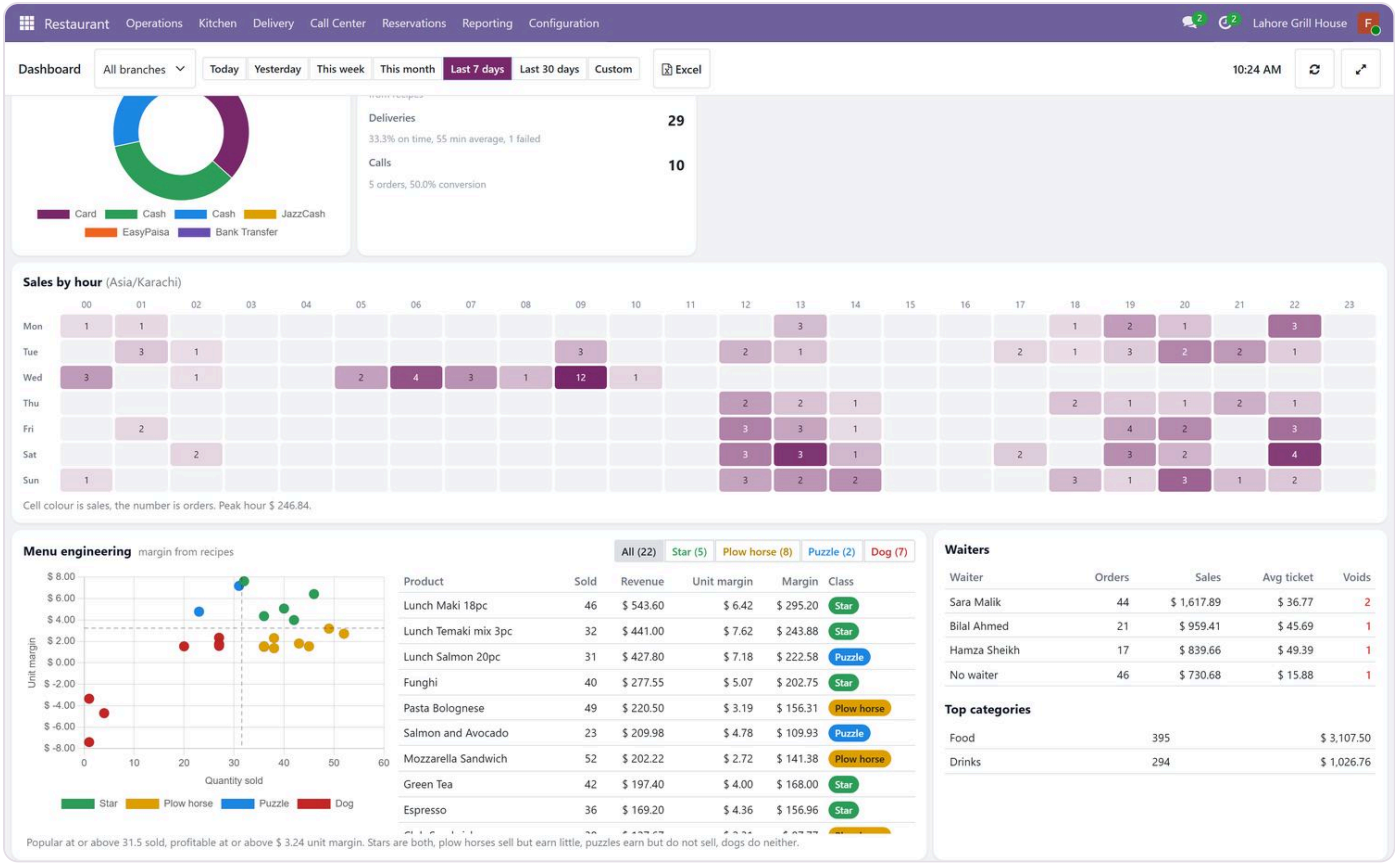

TRY IT YOURSELF ON THE DEMO

1. As the owner, open Reporting, Dashboard, Last 7 days, then pick only DHA Phase 6.
2. Scroll to the menu matrix and find the Stars.
3. Export it to Excel.

REPORTS Reporting, Dashboard: one branch or all, any range. Sales, orders, covers, average ticket, turnover, voids, discounts, tips; sales by day, branch and service; payments; heatmap by hour.

NUMBER	MEANS
Sales	Paid orders including tax, refunds excluded. Net = sales − refunds, and is what the payments add up to.
Covers, per cover	Guests served, and sales divided by guests.
Average ticket	Sales per paid order.
Table turnover	Dine-in orders ÷ tables ÷ days: how many times a table is used per day.
Voids and refunds	Refunded lines plus sent dishes removed with a manager PIN.
Sales by hour	Weekday by hour heatmap: when to put more staff on.
Food cost, deliveries, calls	From recipes, the delivery board and the call center when installed.

REPORTS Menu engineering: every dish placed by how much it sells and how much it earns.

HOW IT WORKS

the menu engineering matrix works

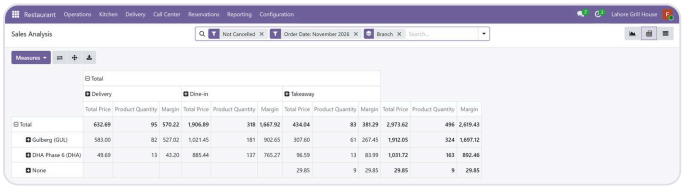

Each dish gets two marks: **popular** (sells at least the average quantity per dish) and **profitable** (earns at least the average margin per portion, using its recipe cost). That gives four groups:

- **Stars**: popular and profitable. Keep them, put them first.
- **Plow horses**: popular, low margin. Raise the price a little or cut the portion cost.
- **Puzzles**: profitable, rarely ordered. Move them up the menu, let waiters suggest them.
- **Dogs**: neither. Rework or remove.

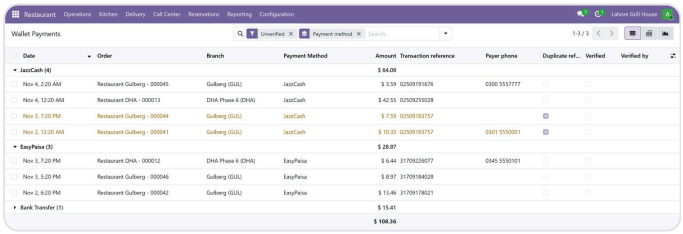

Which report answers which question REPORTS

Question	Report	Module
How did we do today, this week?	Reporting, Dashboard	REPORTS
Did the drawer add up last night?	Reporting, Day Reports (Z)	REPORTS
Which dishes should go?	Dashboard, menu engineering	REPORTS
Which branch sells most, and what?	Sales Analysis, Orders by Branch, Revenue by Branch	REPORTS
How much does each waiter sell and earn in tips?	Tips by Waiter	TABLE OPS

How fast is the kitchen? What is late?	Kitchen Times	KITCHEN DISPLAY
Who voided what, and who approved?	Audit Log, PIN Approvals	BASE
Who worked how many hours?	Shifts	BASE
Are the wallet payments real?	Wallet Payments (Mark verified)	WALLET PAYMENTS
What went missing from the kitchen?	Usage Variance, Wastage Analysis	INVENTORY
What do we need to order?	Suggested Purchases	INVENTORY
Are deliveries on time? Is rider cash short?	Deliveries list (Late, Short collection), Cash Settlements	DELIVERY
How well does the call center convert?	Call Center Analysis, Phone Orders by Branch	CALL CENTER
What do guests say?	Guest Feedback, Birthday Offers, Guest Messages	LOYALTY
Were all receipts reported to the tax authority?	Fiscal Queue	FISCAL
Which table moves happened?	Table Operations	TABLE OPS

REPORTS Sales Analysis with branch, service and waiter as filters and groupings.

WALLET PAYMENTS Wallet Payments: tick the ones found in the merchant portal and Mark verified.

The dashboard and every day report export to Excel, and a day report prints as a PDF or on the receipt printer.

PART 17 Controls: roles, PINs and the audit log

BASE

Restaurants lose money at the till: a void after the food went out, a discount for a friend, a refund that was never asked for. The suite puts a name and a reason on every one of them.

IN THIS PART YOU WILL LEARN

- What each role can and cannot do
- Which actions need a manager PIN
- Where every sensitive action is recorded

TRY IT YOURSELF ON THE DEMO

1. As the manager, open Reporting, Audit Log and filter on void.
2. Open Reporting, PIN Approvals and open the latest one.

Branches are walls

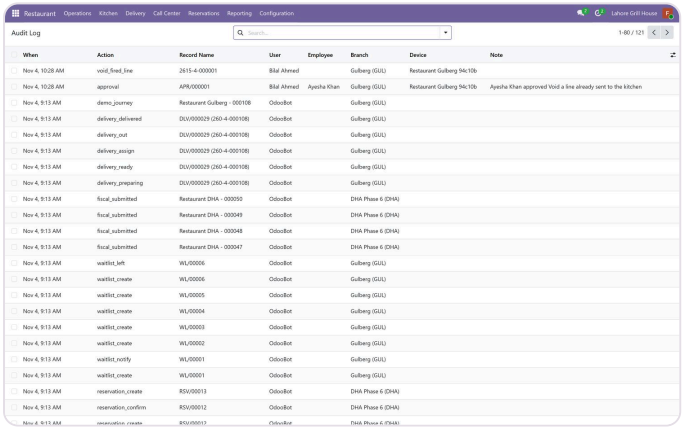

Roles decide what a person can do, and a manager, cashier or waiter sees only their branches, on every screen and report.

A PIN on every risky action

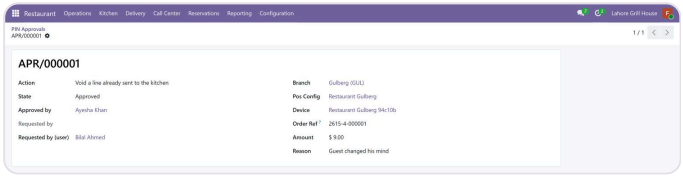

Voids of sent dishes, price changes, big discounts, refunds, reopening a paid order, cash in and out, transfers. Checked on the server, never sent to the till.

Every action logged

Who, when, on which registered device, the value before and after, and who approved.

BASE Reporting, Audit Log: every sensitive action with user, employee, branch and device.

BASE Reporting, PIN Approvals: each request, approved or refused, by whom, for what amount.

Action at the till	Waiter	Cashier	Manager
Take payment	No	Yes	Yes
Remove a sent dish (defaults; each register can change them, Part 4.3)	PIN	PIN	PIN (managers too)
Discount above the limit, price change	PIN	PIN	PIN
Move or merge a table	PIN	PIN	Yes
Cash in / out	No	PIN	PIN
Mark a dish 86	PIN	PIN	Yes

PART 18 Printers, devices and running without internet

PRINTING

A restaurant cannot stop when the internet does. This part explains what keeps working, what to buy, and how to set it up so a bad connection never stops service. With poor internet, Odoo runs on a small PC inside the restaurant: every screen then works over the local network, and only online orders, SMS, tax submission and the call center wait for the line.

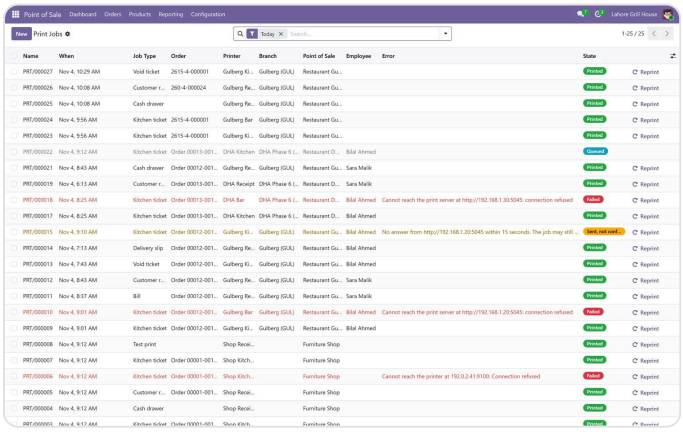

IN THIS PART YOU WILL LEARN

- Which hardware works
- What keeps working when the internet drops
- How to set up a restaurant with poor internet

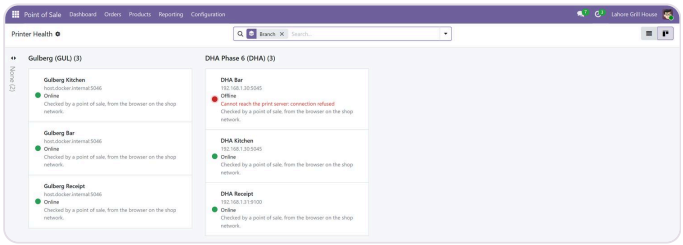

TRY IT YOURSELF ON THE DEMO

1. As the manager, open Operations, Print Jobs, open a kitchen ticket and look at its image.

Device	What works	Notes
Till	Any browser: Windows touch terminal, Android tablet, iPad, phone	Installs as an app; keeps the screen awake
Thermal printer, network	Epson, Xprinter, Bixolon, Citizen, Sunmi, Rongta (ESC/POS); Star TSP100/143/650 (Star raster)	Give it a fixed IP on the router
Any other printer	USB, Bluetooth, label, A4, through the Way4Tech print server on a Windows PC	Picked from a list, never typed
Cash drawer, rider phone	Drawer plugged into the receipt printer; any smartphone for riders	Drawer opens on cash

PRINTING Print Jobs: every ticket with its picture, printer, branch and who printed it; Reprint in one click.

PRINTING Printer Health: each printer's last check; the till shows the same as coloured dots.

When the internet drops

PART	WITHOUT INTERNET
Taking orders and payments at the till	Keeps working; synced when the line is back
Kitchen tickets	Kept on the till and sent when back, never twice
PIN approvals, deliveries, waitlist, online inbox	Need the Odoo server; refused with a notice rather than half done

PART 19

The 15 minute demo, and questions customers ask

A script for showing the system to a restaurant owner. Use two windows: the till as a waiter on a tablet, and the backend as the owner on a laptop. Tell it as one evening at Lahore Grill House.

IN THIS PART YOU WILL LEARN

- A 15 minute demo that shows the whole restaurant
- Honest answers to the questions owners ask

Minute	Show	Say
0-2	Dashboard (owner), last 7 days	"This is your business on one screen, every branch, live."
2-5	Waiter on a tablet: table 12, Funghi with options, seats, course, hold, Send	"The waiter never walks to the kitchen. Every option reaches the cook exactly."
5-6	Kitchen screen: the ticket appears, Bump	"The kitchen sees only its own dishes, with a timer."
6-7	Remove the sent Funghi: reason, manager PIN	"Nobody removes food after it was cooked without your manager knowing."
7-9	Pay with JazzCash; show the receipt with FBR and Rate your meal	"Every wallet payment carries its reference, every receipt goes to FBR."
9-11	Deliveries page: Assign, Out; rider phone	"Riders, zones, and the cash they bring back, checked."
11-12	Online channel: Test inbound; accept it in the till	"Website and Foodpanda orders land here and go straight to the kitchen."
12-13	Waitlist: Add party, Seat	"The host runs the door from the same tablet."
13-15	Recipes, Usage Variance, Suggested Purchases	"You see food cost per dish, and what went missing."

Questions customers ask

QUESTION	ANSWER
Do I need Odoo Enterprise?	No. Everything runs on Odoo 19 Community, including the kitchen screen that is Enterprise-only in standard Odoo. It also runs on Enterprise.
Where do my customers order online?	On your website or app, which sends orders here. If you do not have one, we build the ordering page as a separate item; it reads your menu and prices from this system.
Does it work with Foodpanda?	There is a Foodpanda-style connector. Each marketplace still needs its own partner account and mapping.
What if the internet goes down?	The tills keep selling. For a restaurant with poor internet we run Odoo on a PC inside the restaurant (Part 18).
Do I need an IoT box for printers?	No. Network printers print straight from Odoo; any other printer through our small print server.

Can waiters steal by voiding?	A sent dish cannot be removed without a reason and a manager PIN, and every void is in the audit log and the Z report.
Is it FBR / PRA / SRB compliant?	Receipts are reported to the authority with its number and QR. You register with the authority; we configure it.
Can I take JazzCash and EasyPaisa?	Yes, recorded with the transaction reference and checked against the merchant portal. Payment gateway integration is a separate item.
Can I start small?	Yes. Every module installs on its own; add delivery or the call center later without changing what works.
Does it handle Urdu or Arabic?	Yes. The interface is translatable, and receipts and tickets print as pictures, so any script prints correctly.
Can customers order from the table with a QR?	Odoo's own Self Ordering module does that and can be added alongside; it is not part of this suite.

PART 20 Reference: the menu map and every feature

Every menu of the Restaurant app with the module that brings it, and every feature with the part that teaches it.

Operations

Table Status	Base	Every table and its state
Table Board	Order Taker	Tables by state, with quick actions
Orders	Base	All till orders
Online Orders	Online Orders	The live inbox
Online Order List	Online Orders	Every online order
Branch Transfers	Branch Transfer	Orders sent between branches
Incoming Transfers	Branch Transfer	Waiting for this branch
Stock Transfers	Branch Transfer	Stock between branch stores
Wastage	Inventory	Wastage sheets
Stock Counts	Inventory	Shelf counts
86 List	Menu	Sold out per branch
Loyalty Members	Loyalty	Guests by tier
Printer Health	Printing	Each printer's state
Print Jobs	Printing	Every ticket with reprint

Kitchen

Station Display	Kitchen Display	The kitchen screen
Tickets	Kitchen Display	Every kitchen ticket

Delivery

Board	Delivery	Six-column dispatch board
My Deliveries	Delivery	The rider's phone screen
Deliveries	Delivery	Every delivery
Riders	Delivery	Riders, load, cash
Cash Settlements	Delivery	Rider cash counts
Customers	Delivery	Addresses, landmarks, geocode

Call Center

Agent Console	Call Center	Take phone orders
Calls	Call Center	Every call
Incoming Orders	Call Center	Phone orders to branches
Complaints	Call Center	With SLA
Supervisor	Call Center	Live board

Reservations

Calendar	Reservations	Bookings
Host Stand	Reservations	Waitlist at the door
Waitlist History	Reservations	Every party

Reporting

Dashboard Reports	The owner's screen
Day Reports Reports	X and Z reports
Sales Analysis Reports	Sales by anything
Orders by Branch Reports	Orders and guests
Shifts Base	Hours worked
Tips by Waiter Table Ops	Tips and service
Revenue by Branch Branch Transfer	With transfers
Kitchen Times Kitchen Display	Prep minutes, late
Table Operations Table Ops	Moves and merges
