COMPLETE GUIDE · FIELDS, CROPS, COMPLIANCE, HARVEST, LIVESTOCK AND GRASS

Farm Management for Odoo 19

Fields and crop cycles with a gross margin per hectare, costed field work, input records with pre-harvest intervals that hold, harvests shrunk to contract moisture and invoiced, herds, breeding, milk records and paddock rotation. Every screen and every step, shown on a live demo.

START

About this guide

A farm keeps three sets of books whether it means to or not: the field records an inspector asks for, the store book that says what went on the ground, and the money. Farm Management for Odoo 19 keeps all three in one place, so a spray record, a harvest lot and a gross margin per hectare come from the same entries. This guide walks every screen on a live demo. You do not need to have used Odoo before.

Who it is for

The farm manager, the agronomist and the stockperson who plan and record, the tractor drivers who book their own passes, the farm office that invoices the harvest, and anyone being shown the system for the first time.

How to read it

Front to back the first time. Each part opens with what you will learn and a short thing to try on the live demo, then walks every field and every button.

The live demo

Thornwick Hollow Farms Ltd, an invented mixed farm in Herefordshire: fifteen fields, three harvest years, a dairy herd, a suckler herd and a lowland flock on the grass.

HOW IT WORKS

The demo farm

Address	**farm-demo.way4tech.com**
Sign in	**w4demo** / **Demo2026**
Business	Thornwick Hollow Farms Ltd · a home farm and a rented block · GBP
Runs on	Odoo 19, Community edition, with Inventory and Accounting

MODULE	TECHNICAL NAME	PRICE	NEEDS
Farm Management	`wt_agriculture_farm`	USD 249	Inventory and Accounting (installed with it)

Every farm, person, buyer and number on the demo is invented. The demo is shared and reset from time to time, so what you see may have moved on from the screenshots.

What is in the guide

PART 1	How the module sees a farm	PART 2	Installing, roles and the settings page
PART 3	Farms, fields, crops, seasons and inputs	PART 4	Crop cycles
PART 5	Field work	PART 6	Inputs, intervals and the weather log
PART 7	Harvests, lots and invoicing	PART 8	Gross margin and closing a crop
PART 9	Herds and animals	PART 10	Breeding and production
PART 11	Paddocks and grazing	PART 12	Printed documents
PART 13	A fifteen minute walk-through	PART 14	Questions people ask
PART 15	The menu map		

PART 1 How the module sees a farm

The field is the unit. Everything else, the crop on it, the passes over it, what went on it and what came off it, hangs off the field and the season.

IN THIS PART YOU WILL LEARN

- Farm, field, crop, season and crop cycle
- Why every input line is also the statutory record
- How the gross margin is built up
- The livestock and grass side

A crop cycle, start to finish

1. **Plan** — Crop, field, season, drilling date
2. **In the ground** — Passes booked as they happen
3. **Inputs** — Rate, batch, interval
4. **Harvest** — Refused until clear
5. **Invoice** — At the shrunk tonnage
6. **Close** — Margin per hectare signed off

RECORD	WHAT IT IS	WHERE IT SHOWS
Farm	A holding: code, holding reference, stores, sales journal	Configuration > Farms
Field	Cropped area, parcel reference, soil, pH, drainage, irrigation	Configuration > Fields
Crop	A variety with its growing days, target yield, price and pH range	Configuration > Crops
Season	A harvest year, for example Harvest 2026 from August 2025 to September 2026	Configuration > Seasons
Crop cycle	One crop on one field for one season	Cropping > Crop Cycles
Field activity	One pass over a field: plough, drill, spray, crop walk	Cropping > Field Work
Input application	What went on the ground on that pass, the statutory record	Compliance
Harvest	One load or one day off a cycle, with its lot reference	Cropping > Harvests

The money

Each cycle gathers five cost headings with no overlap: seed booked straight against the crop, inputs from the passes, labour (hours each x people x the labour rate), machinery (machine hours x the machinery rate) and other costs such as rent, drying and haulage. Output is the confirmed and invoiced harvests, valued on the tonnage shrunk back to the moisture the contract pays on. Revenue less cost is the gross margin, shown per hectare and as a cost per tonne.

Stock and grass

Herds and flocks hold individual animals with the official ear tag, weights, breeding and calvings. Milk, eggs and wool go into a production log. Paddocks carry a rest clock and a stocking limit, and grazing blocks move a herd on and off them.

What is not in the module

NOT INCLUDED	WHERE IT LIVES INSTEAD

Buying inputs and paying suppliers	Odoo Purchase and Accounting
Subsidy claim forms	Not built. Parcel references are on the fields for the claim.
Maps and field boundaries	Not built. Fields carry an area and a colour, no map.
Movement licences and the official herd register	Not built. Ear tags and exits are recorded for your own register.
Weather station feeds	Not built. The weather log is typed in.

PART 2 Installing, roles and the settings page

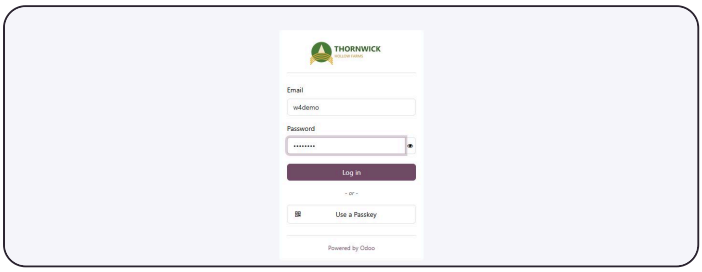

The module installs on Odoo 19 Community and brings Inventory and Accounting with it. Ten settings decide how passes are costed and which rules are enforced.

IN THIS PART YOU WILL LEARN

- The three roles and what each one sees
- Every setting on the Agriculture settings page
- Signing in to the demo

TRY IT YOURSELF ON THE DEMO

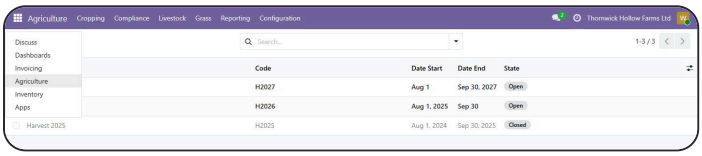

1. Sign in as w4demo and open the Agriculture app
2. Open the Configuration menu

1

Sign in

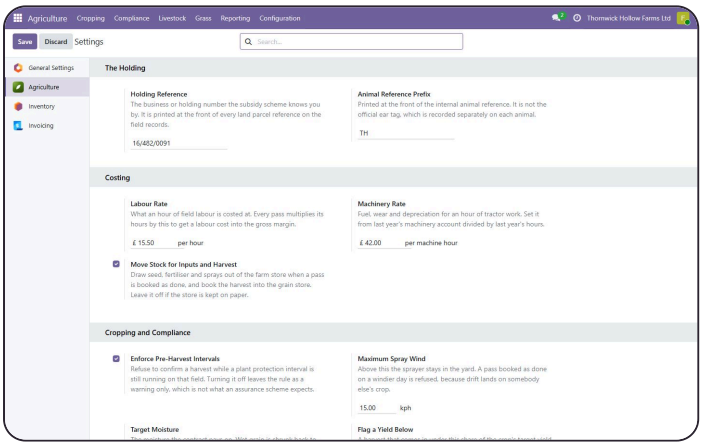

Open the demo address and sign in with the shared login. The demo user is a farm manager but cannot change system settings, so the settings page below was captured as the administrator.

2

The app

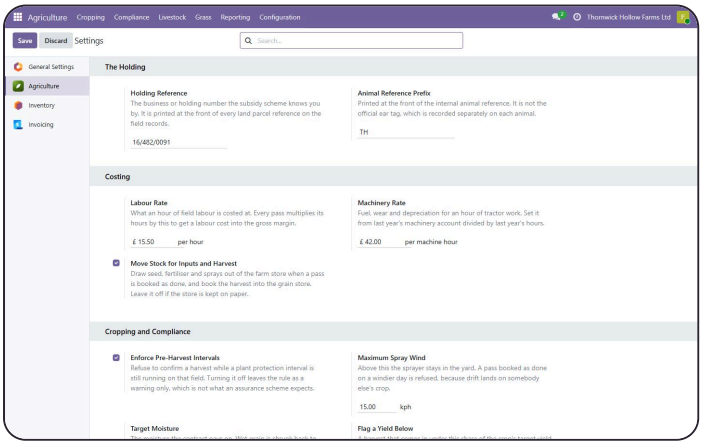

Agriculture sits beside Inventory and Invoicing.

3

Settings

Configuration > Settings (system administrators only) opens the Agriculture block of the Odoo settings page. The values are kept on the company.

4

The rest of the page

The limits that are enforced and the look ahead for the nightly jobs.

SETTING	DEFAULT	WHAT IT DOES
Holding Reference		Printed in front of every land parcel reference (a farm can override it)

Animal Reference Prefix	A	In front of the internal animal reference, not the ear tag
Labour Rate	14 / hour	Hours each x people x this = labour cost of a pass
Machinery Rate	38 / hour	Machine hours x this = machinery cost of a pass
Move Stock for Inputs and Harvest	On	Inputs drawn from the farm store, harvests booked into the grain store
Enforce Pre-Harvest Intervals	On	Refuse to confirm a harvest while an interval runs
Maximum Spray Wind	15 kph	A spray booked as done above this is refused
Target Moisture	14.5%	Wet grain is shrunk back to this figure
Flag a Yield Below	80%	A cycle under this share of its target yield is flagged
Minimum Paddock Rest	21 days	Stock cannot go back on a paddock sooner
Look Ahead	14 days	How far the nightly jobs look for crops coming ready and calvings

Who sees what

ROLE	CAN	CANNOT
Farm Worker	See crop cycles, book the passes they are named on (and unassigned ones), write the weather, weights and production, see herds, animals and grass	See other people's passes or application lines, the Harvests, Breeding and Compliance menus, margins, prices
Agronomist / Stockperson	Everything a worker can, every pass, input applications, intervals, harvests, breeding	Margins, the reporting menu, configuration, prices on animals, operator certificates
Farm Manager	Everything, including the Gross Margin report and sheet, invoicing, animal purchase and sale prices and the spray operator certificate number	

Every model has a multi-company rule. Crops and seasons left without a company are shared.

PART 3 Farms, fields, crops, seasons and inputs

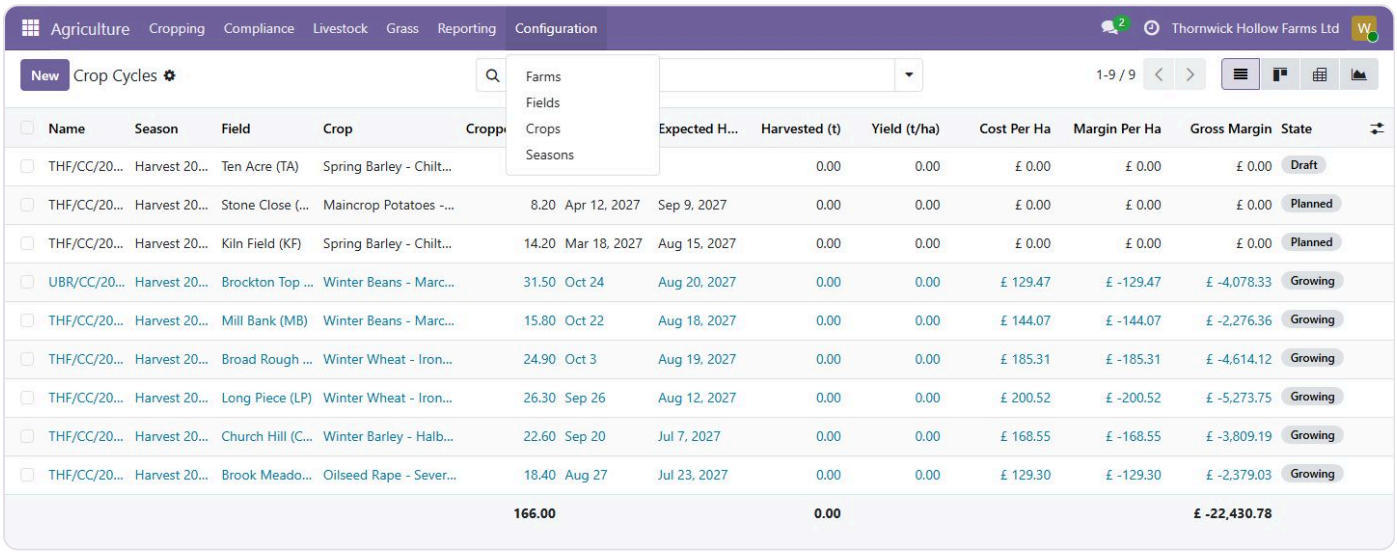

Set these up once. Everything per hectare divides by the area on the field, and everything about a spray comes from the input product.

IN THIS PART YOU WILL LEARN

- A farm with its stores and sales journal
- Fields: cropped area, parcel reference, soil and pH
- Crops as varieties, with rotation group and pH range
- Seasons and why a closed one stays closed
- Setting a product up as a farm input

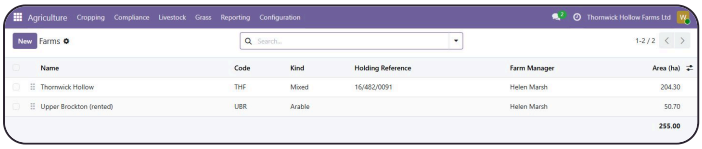

TRY IT YOURSELF ON THE DEMO

1. Configuration > Fields, switch to kanban
2. Open Brook Meadow Arable and read its Cropping History
3. Open Configuration > Seasons > Harvest 2025

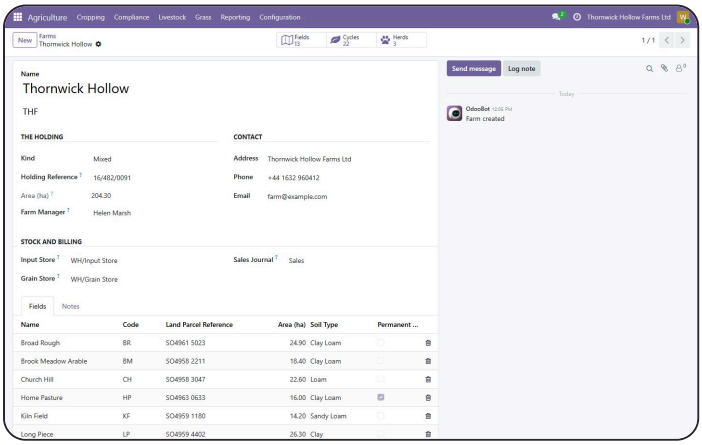

Name	Season	Field	Crop	Cropp	Expected H...	Harvested (t)	Yield (t/ha)	Cost Per Ha	Margin Per Ha	Gross Margin	State

Agriculture > Configuration: Settings, Farms, Fields, Crops, Seasons.

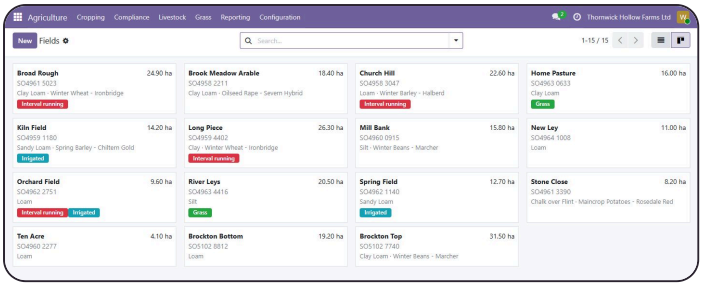

1 Farms

One record per holding. The demo has the home farm and a rented block.

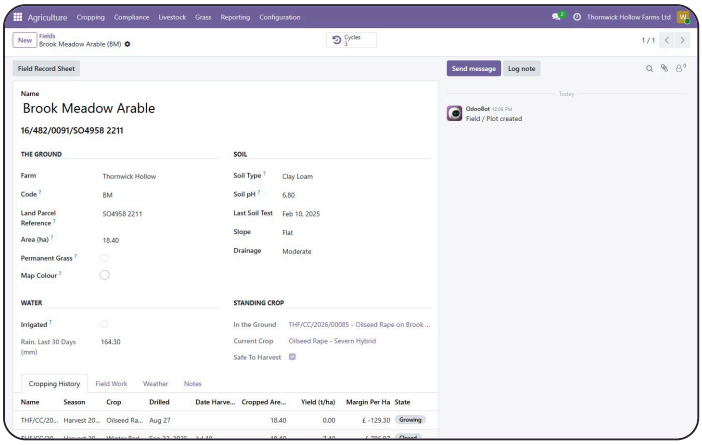

2 A farm

Code (it prefixes every cycle, pass and harvest number), kind, holding reference, manager (gets the harvest notices), the **Input Store** inputs are drawn from, the **Grain Store** harvests land in and the **Sales Journal** harvests are invoiced through. Stat buttons for fields, cycles and herds; the total area adds up every field.

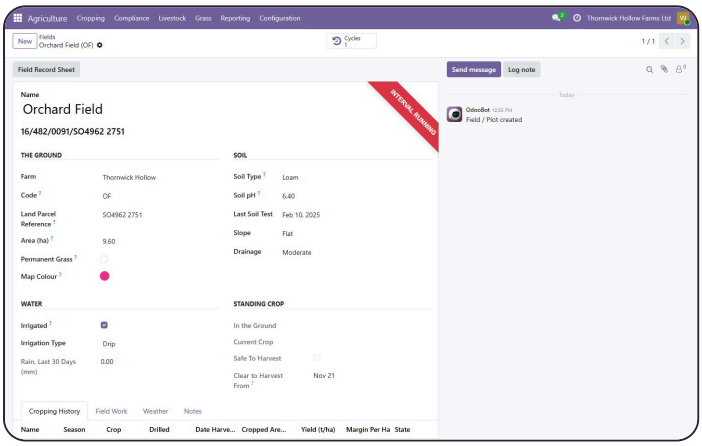

3 Fields

Cards in the field's own colour with the area, soil and what is in the ground. Filters Cropped, Grassland, Irrigated, Something in the Ground and Archived; group by farm, soil or standing crop.

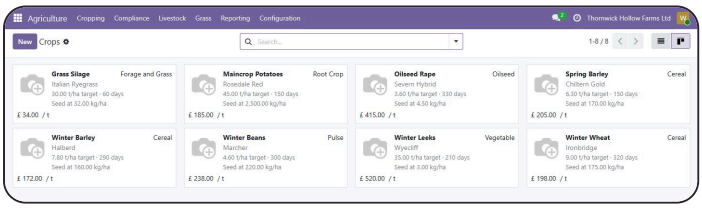

4 A field

Area is the cropped area, not the area inside the hedge. The land parcel reference is unique per company and the **full parcel reference** puts the holding reference in front, the way an inspector writes it. Soil type, pH (0 to 14) and test date, slope, drainage, irrigation and Permanent Grass. **Clear to Harvest From** is the last running interval on the ground; rain over the last 30 days comes from the weather log. Tabs for cropping history, field work, weather and notes.

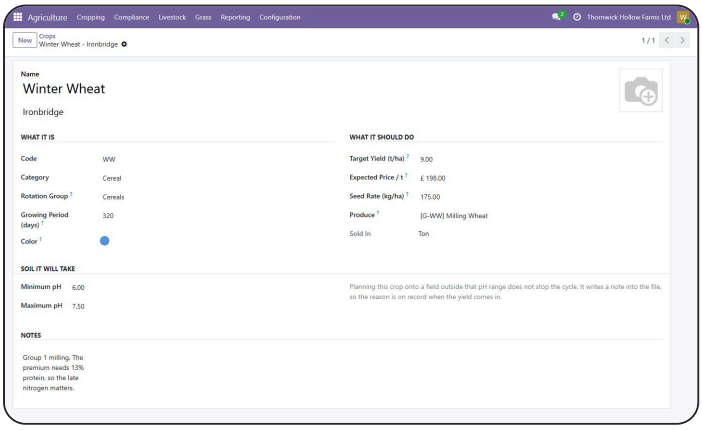

5 A field still under an interval

Orchard Field carries leeks sprayed for rust this week, so it shows the date it is clear again.

6 Crops

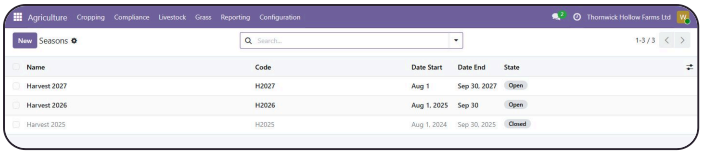

One record per crop and variety.

7 A crop

Category, **rotation group** (two crops of the same group back to back raise a warning), growing days (drilling to harvest, gives the expected harvest date), the produce product it is stored and invoiced as, target yield in t/ha (the yield alert measures against it), expected price (values an unsold harvest), seed rate (suggests the seed quantity) and the pH range (a field outside it raises a warning).

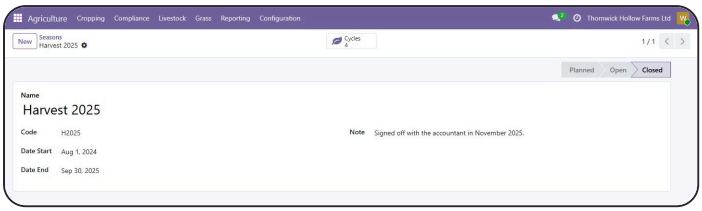

Set the produce product up in tonnes, because harvest quantities are tonnes.

8

Seasons

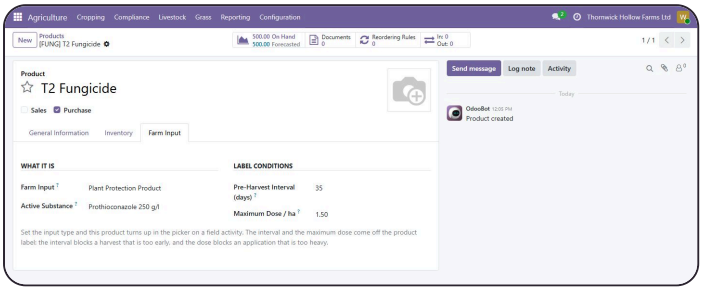

A harvest year runs from the autumn drilling to the following harvest. Two ship with the module, this year and next.

9

A closed season

Close Off is refused while any cycle is still draft, planned or growing. A closed season takes no new cycles and cannot be reopened: open a new season instead.

10

A farm input

Any product becomes an input with the Farm Input tab: the input type (seed, fertiliser, plant protection, lime, feed, veterinary, other), the **pre-harvest interval** and **maximum dose per hectare** off the label, and the active substance printed on the spray record.

PART 4 Crop cycles

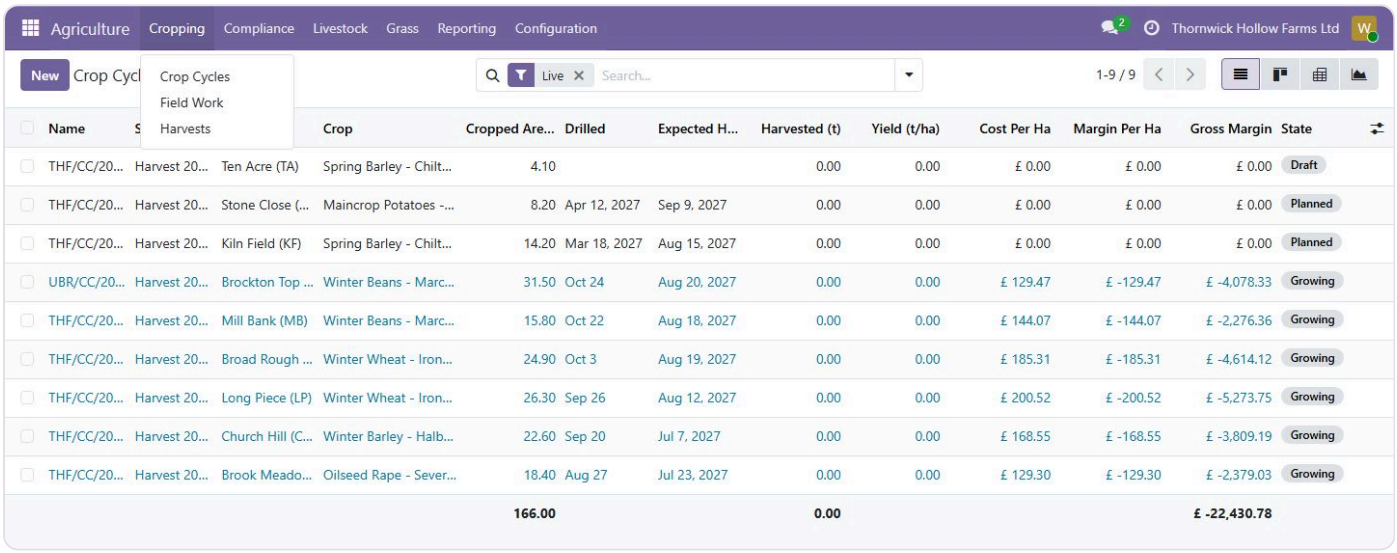

A cycle ties one crop to one field for one season. Every cost booked against it and every tonne taken off it lands in the same record.

IN THIS PART YOU WILL LEARN

- Draft, planned, growing, harvested, closed and cancelled
- What Plan checks, and the rotation and pH warnings
- The area and date rules

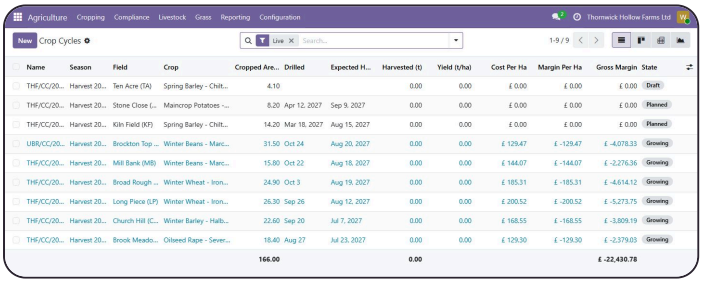

TRY IT YOURSELF ON THE DEMO

1. Crop Cycles, switch to kanban
2. Open the Harvest 2027 barley on Church Hill and read its chatter
3. Open the planned potatoes on Stone Close

Name	Season	Field	Crop	Cropped Are...	Drilled	Expected H...	Harvested (t)	Yield (t/ha)	Cost Per Ha	Margin Per Ha	Gross Margin	State

Agriculture > Cropping: Crop Cycles, Field Work and Harvests.

1

Crop cycles

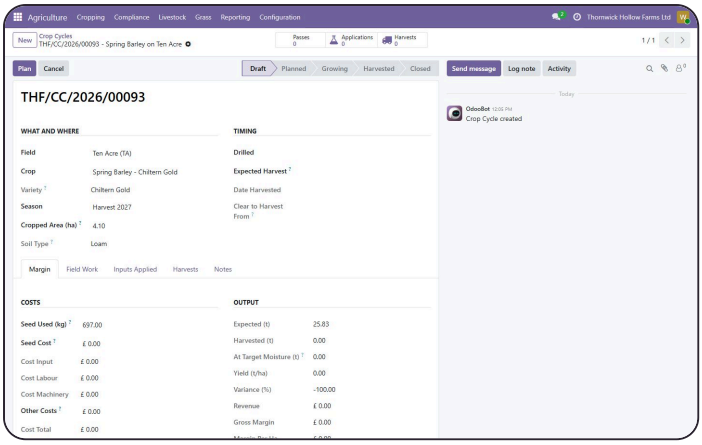

Live cycles by default: number, field, crop, season, area, drilled and expected dates, yield, gross margin and state. Growing ones are blue, closed ones green, a cycle below its target yield red. Filters Live, In the Ground, Harvested, Below Target Yield, Interval Still Running and Due Off This Month.

2

The board

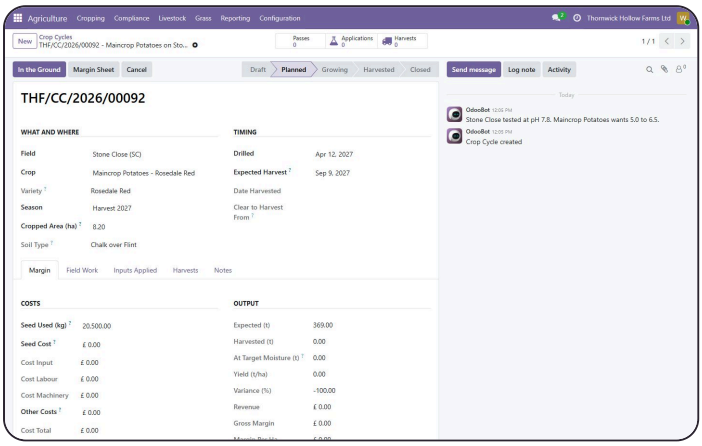

The same cycles by state.

3

Draft

Field, crop, season and cropped area (filled from the field; drop it for a part field). The seed quantity is suggested from the crop's seed rate and the area. Seed Cost is for a seed invoice booked straight against the crop; leave it empty when the seed goes on the drilling pass, or the seed is paid for twice. Other Costs takes rent, contract work, drying and haulage.

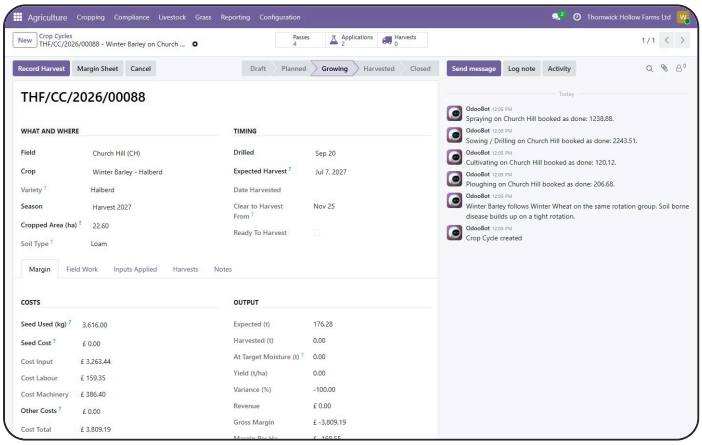

4

Plan

Needs a drilling date and an open season. The expected harvest is the drilling date plus the crop's growing days, and can be moved. Plan writes any agronomy warning into the chatter: here potatoes on chalk at pH 7.8, outside the crop's 5.0 to 6.5.

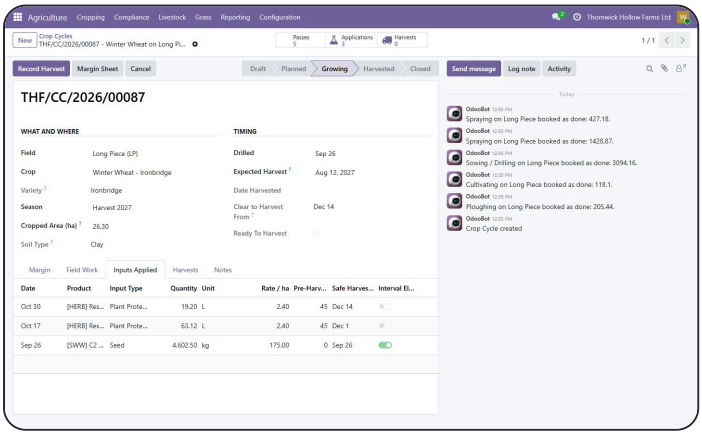

Warnings are recorded, not refused. A grower has good reasons to break a rotation now and again; what matters is that it is on file.

5

A rotation warning

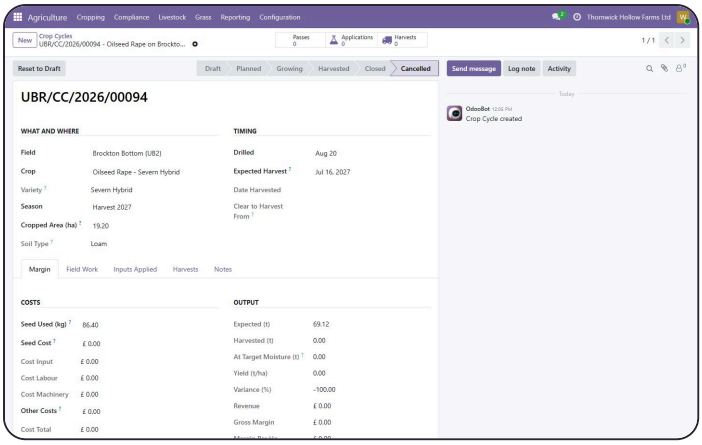

Barley after wheat on Church Hill: both cereals, so Plan noted it.

6

In the ground

In the Ground moves a planned cycle to Growing. Passes and inputs build up under it; the Inputs Applied tab here shows the autumn herbicide whose interval is still running.

7

Cancelled

Cancel is refused once a harvest is on a posted invoice. Reset to Draft is refused while harvests other than cancelled ones are recorded.

RULE	WHAT IS REFUSED
Area	A cycle bigger than its field, or cycles whose dates overlap adding up to more than the field
Dates	An expected harvest before drilling; a drilling date outside the season
Season	Plan on a closed season
Close	Closing a cycle that has not been harvested

PART 5 Field work

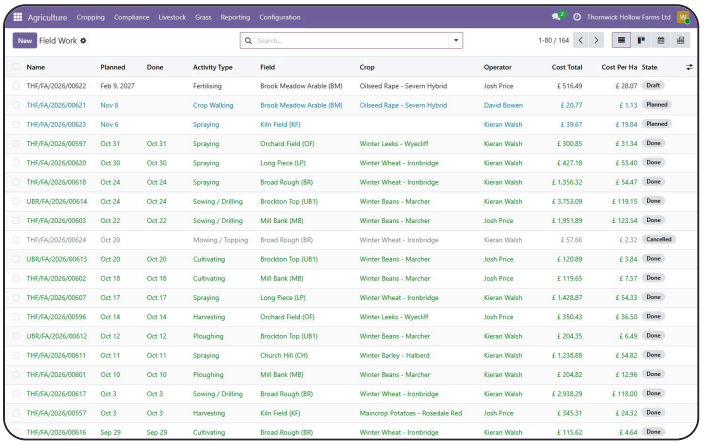

A field activity is one pass over a field. It carries the people, the hours, the machine and what went on the ground, and it is costed the day it is booked.

IN THIS PART YOU WILL LEARN

- Planning and booking a pass
- How labour, machinery and input costs are worked out
- Part field passes and passes between crops
- Why a spray on a windy day is refused

TRY IT YOURSELF ON THE DEMO

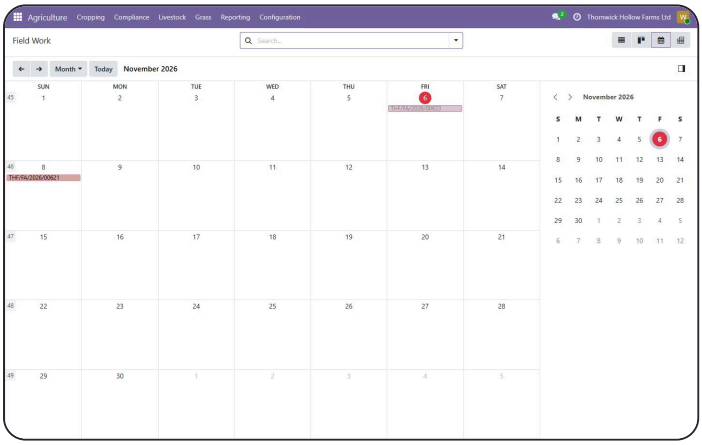

1. Field Work, switch to calendar
2. Open a done spray and read its Inputs Used and Cost tabs
3. Open the planned spray on Kiln Field for today: the wind reading is 24 kph

1

Field work

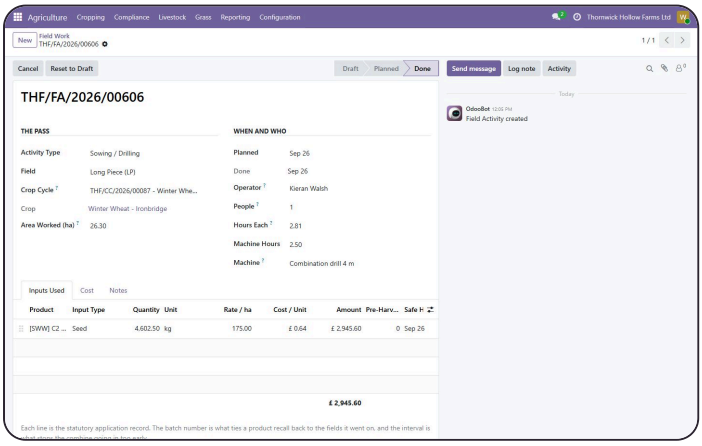

Every pass with type, field, cycle, planned and done dates, operator, area, inputs count, cost and state. Filters My Passes, Not Yet Done, Done, Put Something On and This Month; group by operation, field, cycle, operator, status or date.

2

Calendar

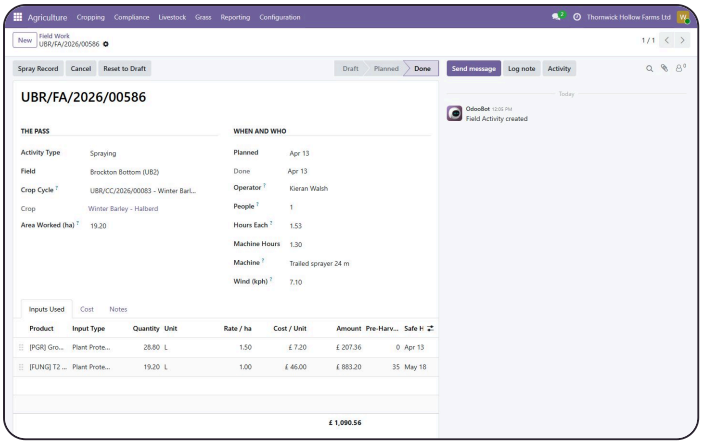

Passes on their planned dates. There is also a kanban by state and a pivot of the cost of field work.

3

Drilling

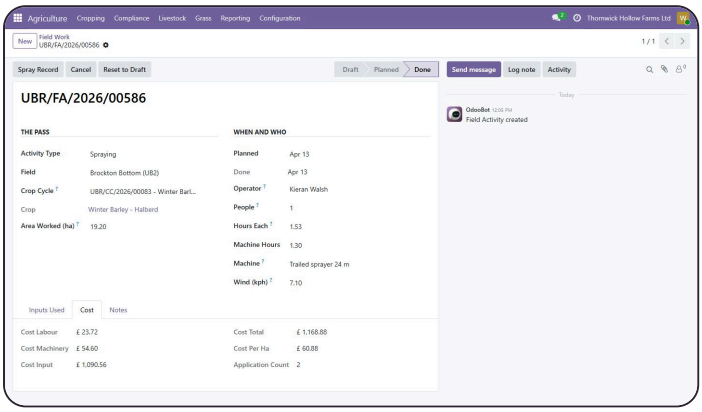

Operation, field and cycle (the cycle in the ground on that field is filled in), date, operator, people, hours each, machine hours and the machine. The Inputs Used tab is the seed with its batch number.

4

A spray

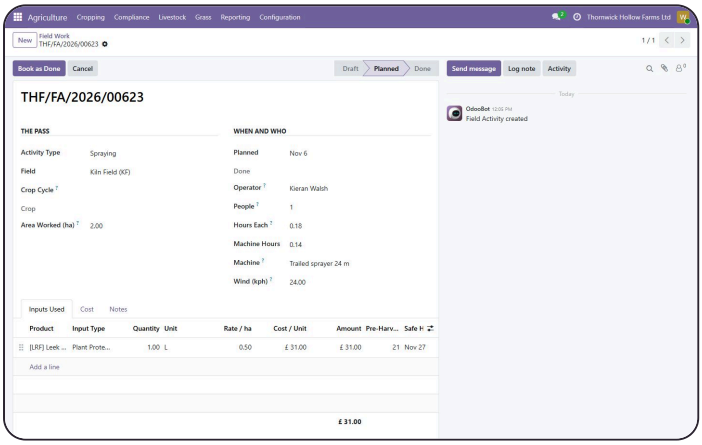

Each input line: product, active substance, quantity, unit, rate per hectare, cost per unit (the product cost, overwritable with the invoice price), amount, pre-harvest interval (copied from the label), batch, target, and the operator certificate number (visible to managers only).

5

Cost

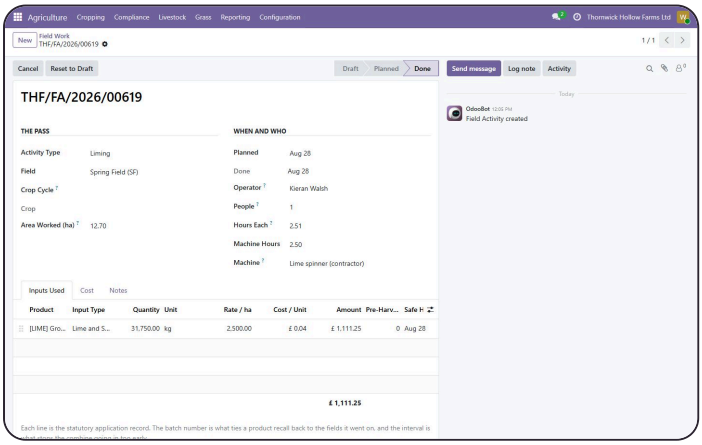

Labour = hours each x people x the labour rate. Machinery = machine hours x the machinery rate. Inputs = the input lines. Total and cost per hectare over the area worked.

6

Refused for wind

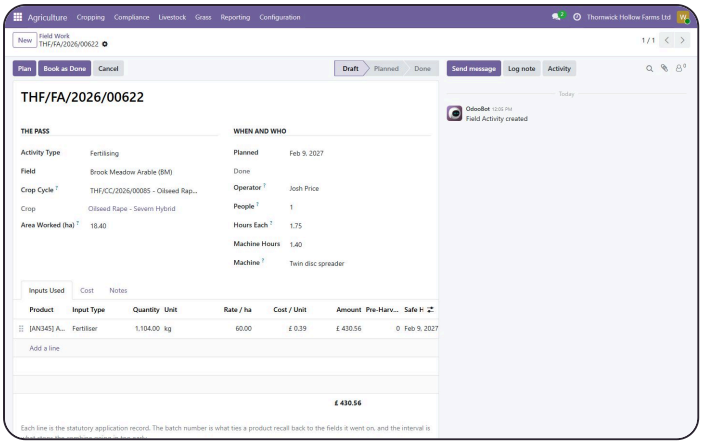

The wind reading is filled from the weather log for that field and day. Book as Done on a spray above the company limit is refused, with the reading and the limit in the message. Correct the reading or move the pass.

7

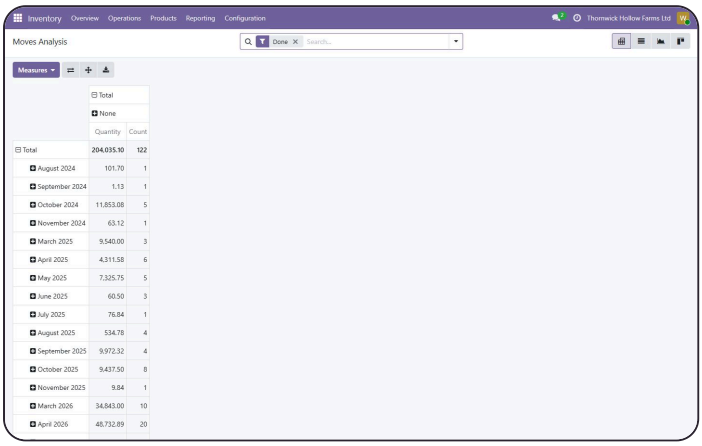

Between crops

A pass with no cycle, here lime on Spring Field: it is on the field record but in no crop's margin. A pass can also cover part of a field by lowering Area Worked.

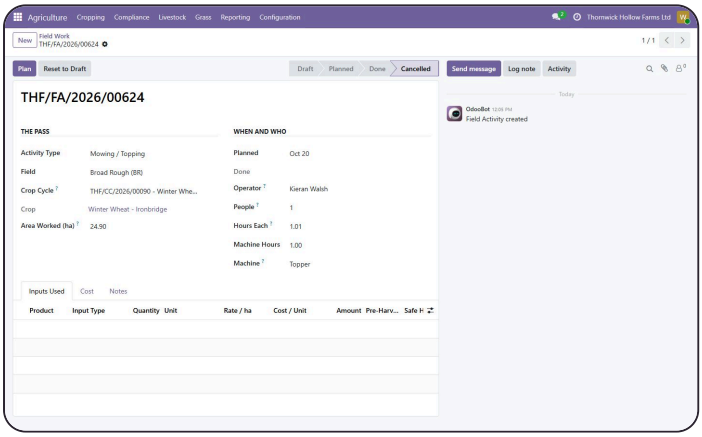

8 Draft and planned

Plan puts a draft on the programme. Book as Done stamps the done date, posts the cost on the cycle's chatter and, with stock tracking on, draws each input out of the farm's input store as a done stock move to the production location.

9 The store moves

Every input booked as done and every confirmed harvest is a done stock move. Inventory > Reporting > Moves Analysis shows them by month, dated on the day of the pass or the cut.

10 Cancelled

Cancel is refused once a done pass has drawn stock; so is Reset to Draft. A done pass cannot be deleted at all: its lines are the spray record.

BOOK AS DONE REFUSES	BECAUSE
A sowing, fertiliser, spray or lime pass with no input lines	An application with no record never happened as far as an inspection is concerned
A spray above the maximum spray wind	Drift lands on somebody else's crop
A line above the label maximum dose (on saving)	An over-dose is a rejected load
A pass bigger than the field, or a cycle on another field	The area and the cycle have to agree

PART 6 Inputs, intervals and the weather log

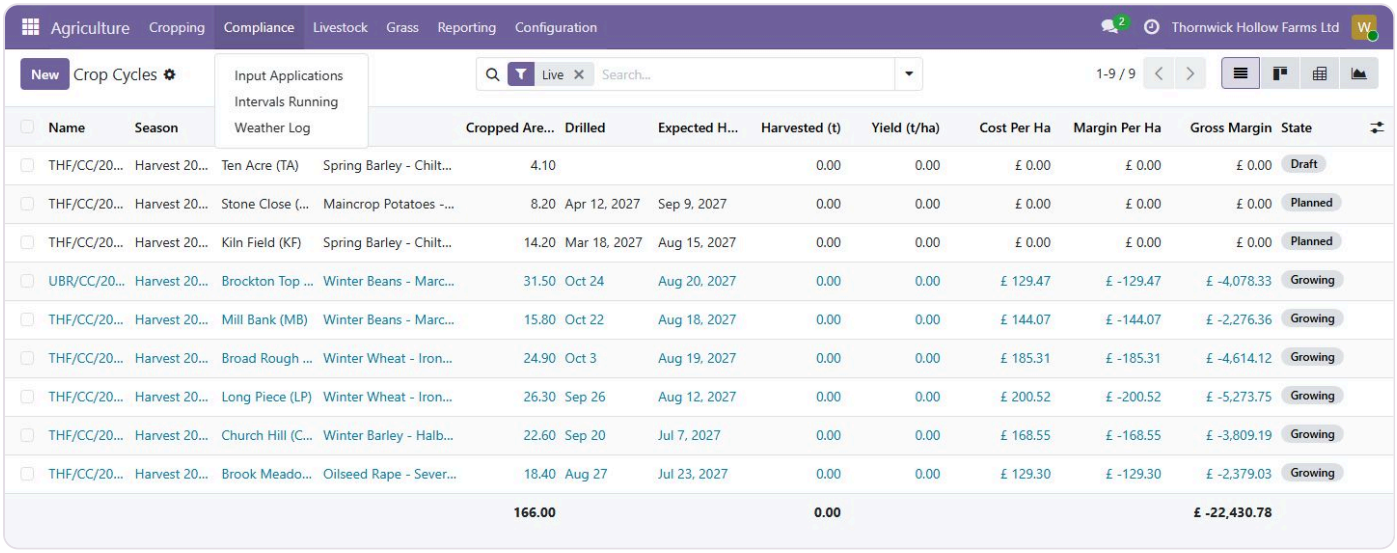

Every input line is the statutory application record. The pre-harvest interval on it decides when the field can be cut again.

IN THIS PART YOU WILL LEARN

- Input Applications and Intervals Running
- How the clear date is worked out and refreshed
- The weather log and what reads it

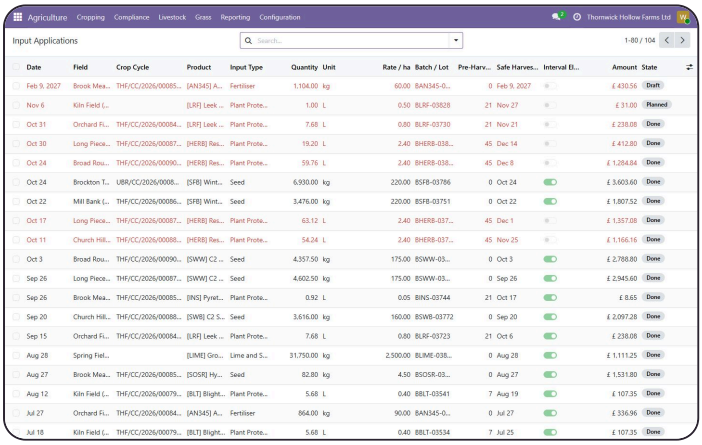

TRY IT YOURSELF ON THE DEMO

1. Compliance > Intervals Running
2. Compliance > Weather Log, switch to graph

Name	Season			Cropped Are...	Drilled	Expected H...	Harvested (t)	Yield (t/ha)	Cost Per Ha	Margin Per Ha	Gross Margin	State

THF/CC/20...	Harvest 20...	Church Hill (C...	Winter Barley - Halb...	22.60	Sep 20	Jul 7, 2027	0.00	0.00	£ 168.55	£ -168.55	£ -3,809.19	Growing
THF/CC/20...	Harvest 20...	Brook Meado...	Oilseed Rape - Sever...	18.40	Aug 27	Jul 23, 2027	0.00	0.00	£ 129.30	£ -129.30	£ -2,379.03	Growing
				166.00			0.00				£ -22,430.78	

Agriculture > Compliance: Input Applications, Intervals Running, Weather Log.

1

Input applications

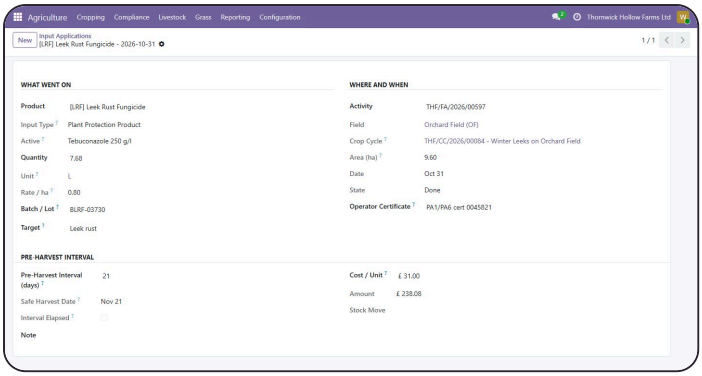

Every line from every pass: date, field, cycle, product, input type, active substance, quantity, rate per hectare, interval and the date the field is clear. Lines still inside their interval are red. Filters Interval Still Running, Plant Protection, Fertiliser and Booked as Done.

2

Intervals running

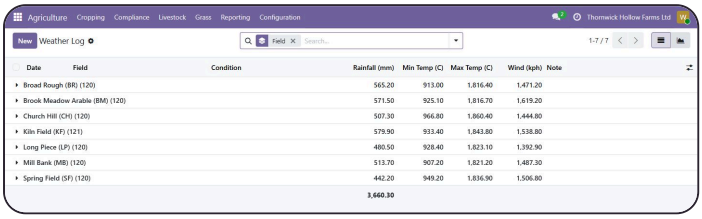

Only booked applications whose interval has not elapsed, grouped by field. This is the list to read before the combine goes out.

3

One application

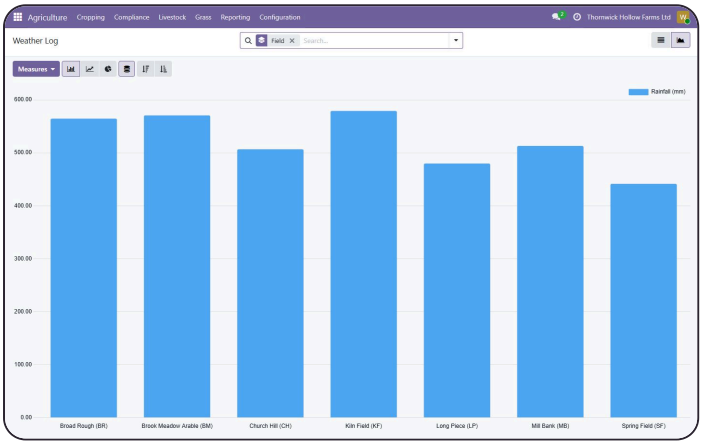

Applied date plus the interval is the clear date. **Interval Elapsed** is stored so it can be searched, and the nightly job **Farm: expire pre-harvest intervals** refreshes it, so a field blocked this morning is free this afternoon without anyone editing it.

4

Weather log

One line per field per day: rain, minimum and maximum temperature, wind, humidity and condition. Rainy days blue, storms red. A date in the future is refused: it records what happened, not a forecast.

5

Rainfall

Rain by field. The same figures give the 30 day rainfall on the field form.

> The interval belongs to the ground, not to the paperwork: when a harvest is confirmed, every booked application on that field since the crop was drilled counts, including passes not tied to the cycle.

PART 7 Harvests, lots and invoicing

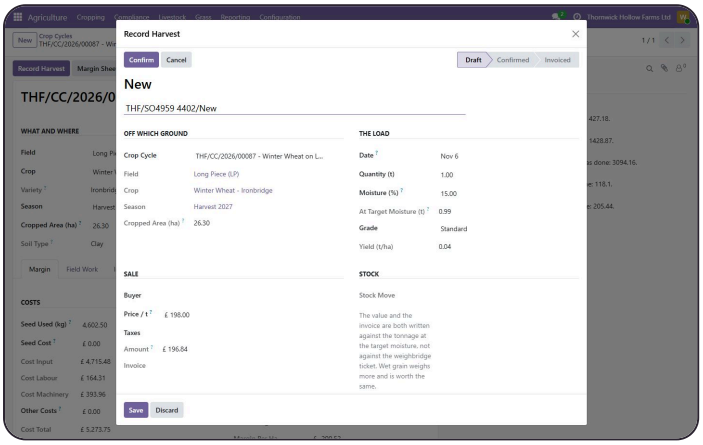

A harvest record is a load or a day off a cycle. It is weighed, shrunk to the contract moisture, given a lot reference, booked into the grain store and invoiced on the shrunk weight.

IN THIS PART YOU WILL LEARN

- Recording a harvest and what Confirm checks
- Moisture shrink and the lot reference
- Invoicing, the harvest advice and traceability

TRY IT YOURSELF ON THE DEMO

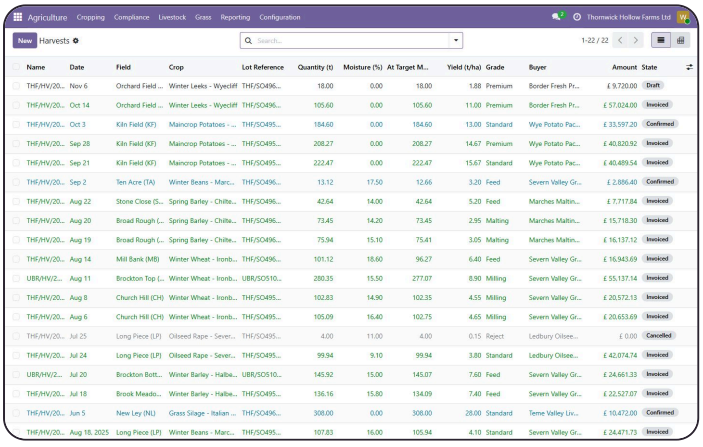

1. Cropping > Harvests, filter To Invoice
2. Open the draft leek harvest: it cannot be confirmed yet
3. Open a paid wheat load and read its Traceability tab

1

Record Harvest

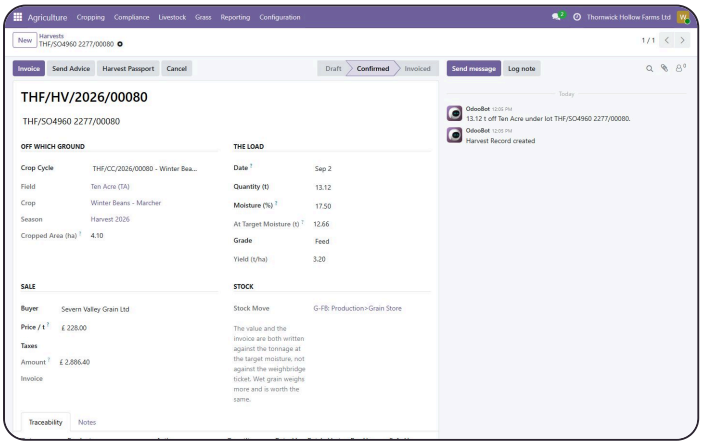

On a growing or harvested cycle, Record Harvest opens a new harvest with the cycle, today's date and the crop's expected price.

2

Harvests

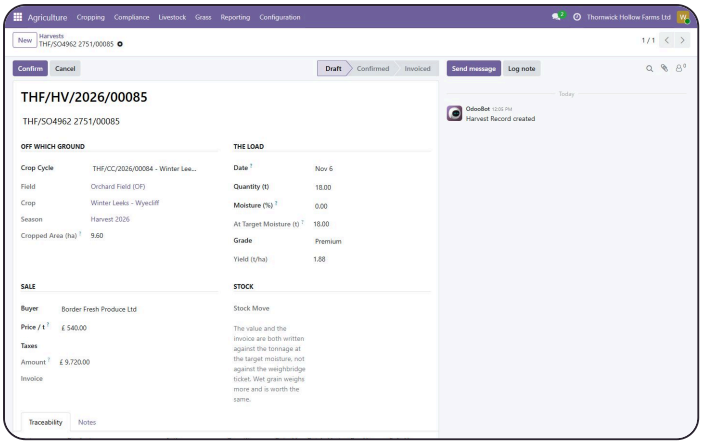

Every load: lot, cycle, field, crop, date, tonnes, moisture, tonnes at target moisture, grade, buyer, value and state. Filters Confirmed, To Invoice and Rejected Grade; there is a tonnage pivot.

3

Moisture shrink

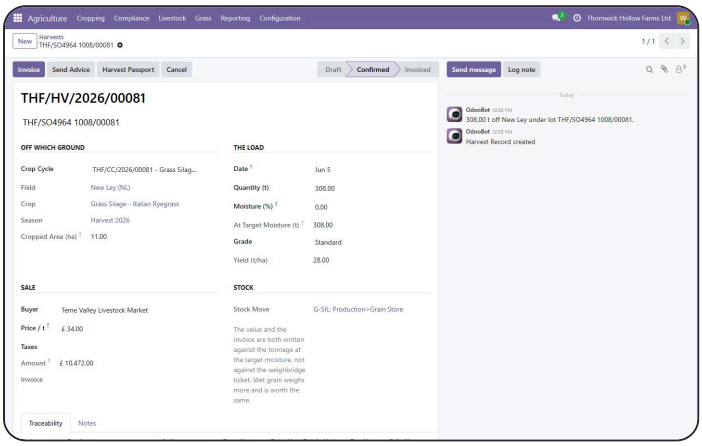

Wet grain weighs more and is worth the same. Above the target moisture the tonnage is shrunk: tonnes x (100 - moisture) / (100 - target). The value is the shrunk tonnes x the price per tonne.

4

Refused for the interval

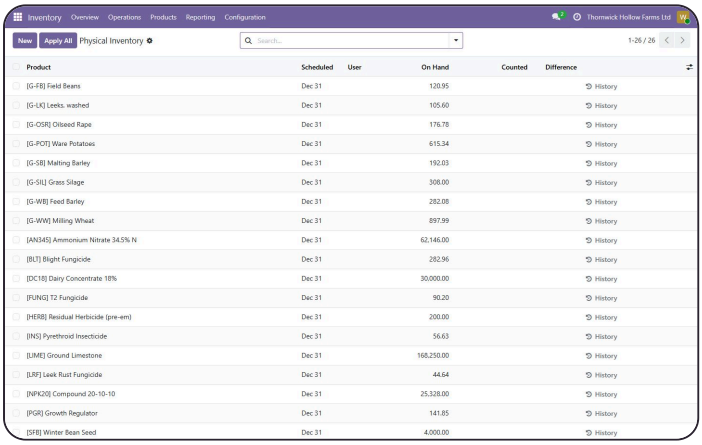

Confirm is refused while an application on the field is inside its interval on the harvest date, and the message names the product, the date and the clear date. With Enforce Pre-Harvest Intervals switched off it is not checked.

5

Confirmed

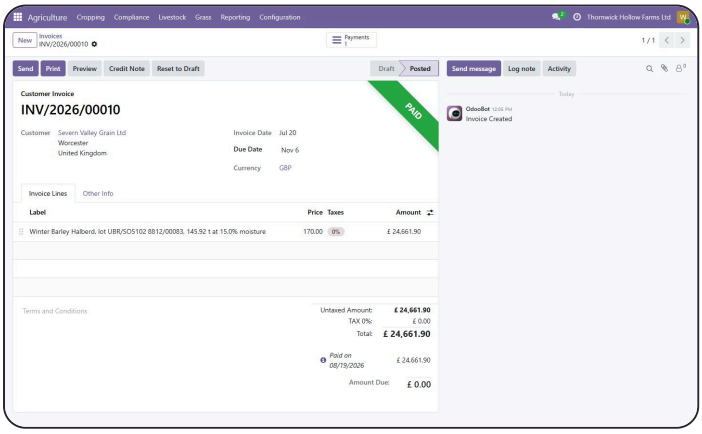

Confirm books the weighed tonnage into the grain store (a done stock move from production, shown in Stock Move), moves a growing cycle to Harvested with the harvest date, and writes the lot in the chatter. The lot reference is farm code / parcel reference / harvest number; overwrite it with the merchant's lot if they issue one.

6

Grain in store

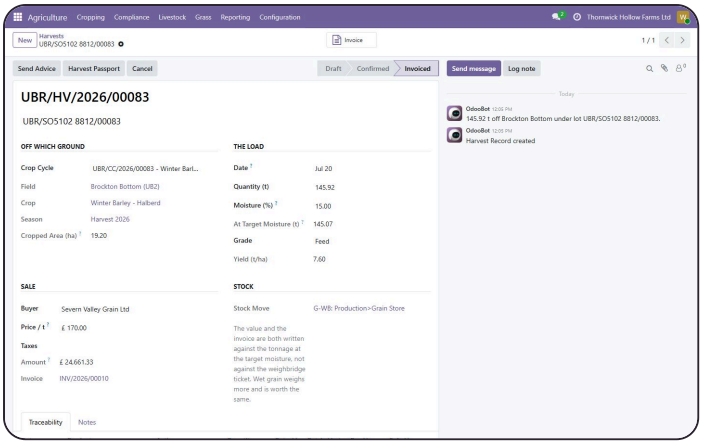

Inventory > Physical Inventory: the harvested tonnes of each produce product in the grain store, and what is left of each input in the input store.

7

The invoice

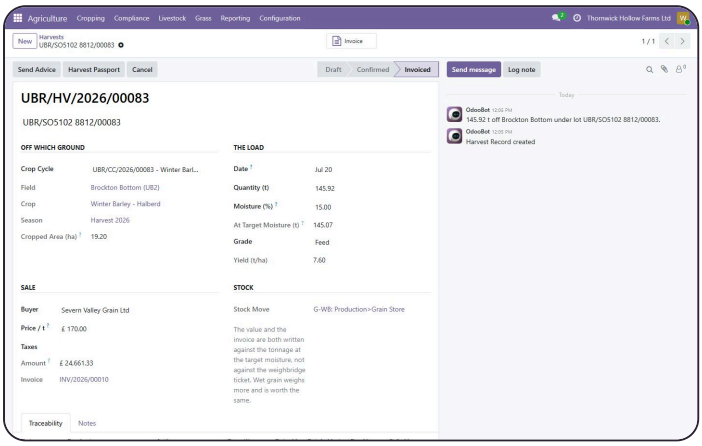

Invoice raises a customer invoice in the company currency through the farm's sales journal: the produce product at the shrunk tonnage and contract price, the line reading crop, variety, lot, weighed tonnes and moisture, the product's taxes. Post and collect it in Accounting.

8

Invoiced

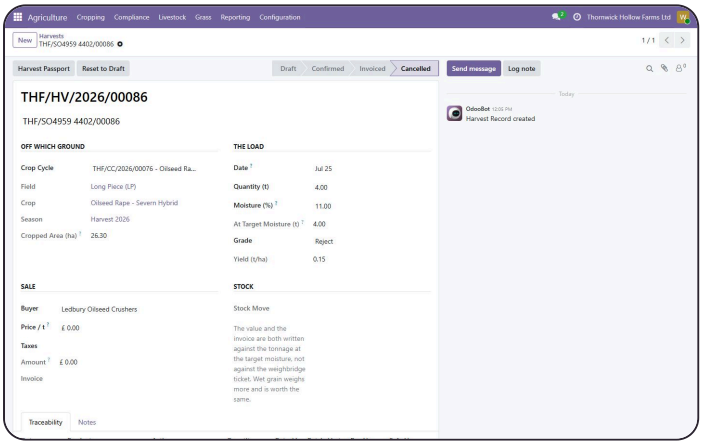

Invoiced loads count in the margin; the Invoice button opens the invoice. Send Advice mails the buyer the weight, moisture and lot (template Farm: Harvest Advice).

9

Traceability

Every product that went on that ground from drilling to the cut date, with dates, rates and batch numbers. After a residue query, this is the answer. The Harvest Passport prints it.

10

Cancelled

Cancel and Reset to Draft are refused once the load is on a posted invoice; Reset to Draft is also refused once it is in the grain store.

PART 8 Gross margin and closing a crop

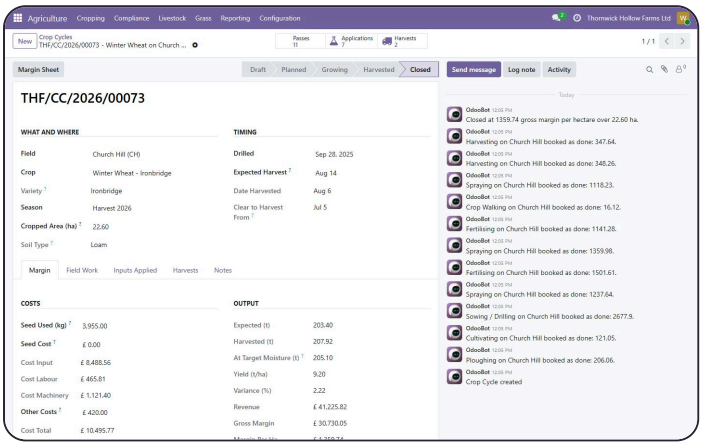

Gross margin per hectare and cost per tonne, per crop, per field and per season, from the same entries as the field records.

IN THIS PART YOU WILL LEARN

- The Margin tab on a cycle
- The yield alert
- The Gross Margin report
- Closing a cycle and a season

TRY IT YOURSELF ON THE DEMO

1. Reporting > Gross Margin, group rows by crop
2. Open the second wheat on Mill Bank: below target

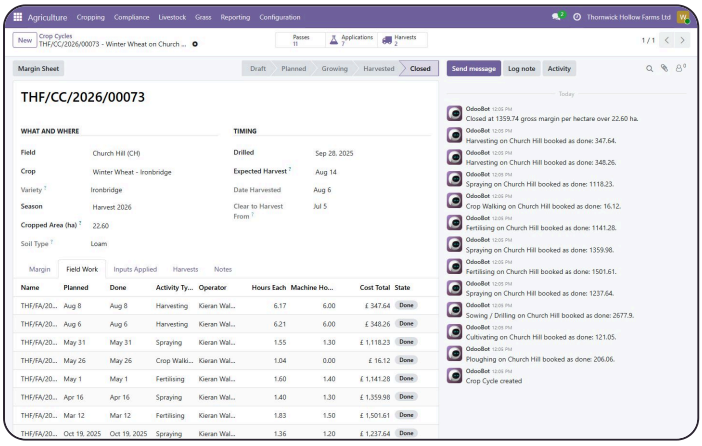

1

The margin

Seed, inputs, labour, machinery and other costs, total and per hectare; harvested tonnes, tonnes at target moisture, yield per hectare, expected tonnes and the variance; revenue, gross margin, margin per hectare and cost per tonne.

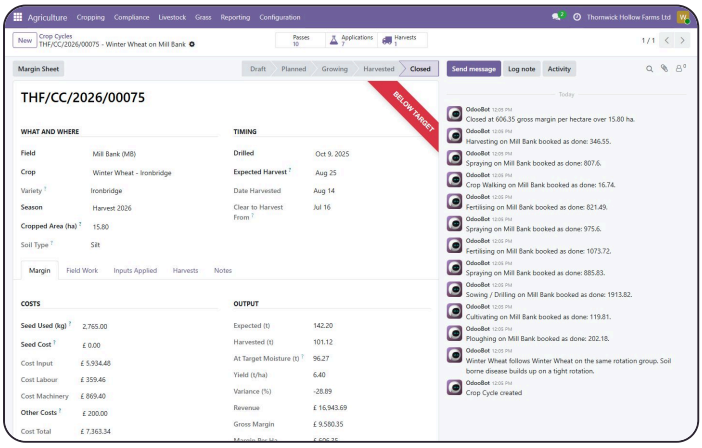

Only confirmed and invoiced harvests count. A draft load is out of the margin.

2

What built it

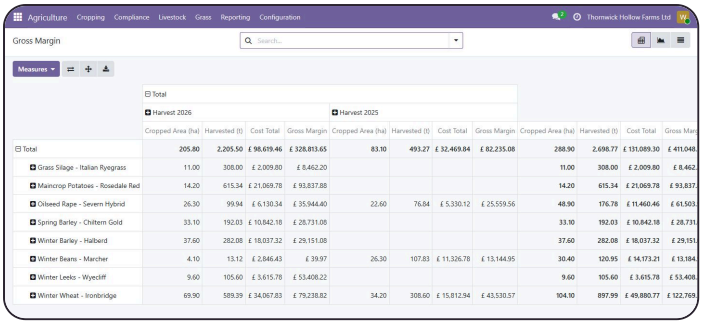

The Field Work tab lists every pass with its cost. Cancelled passes are left out of the cost.

3

Below target

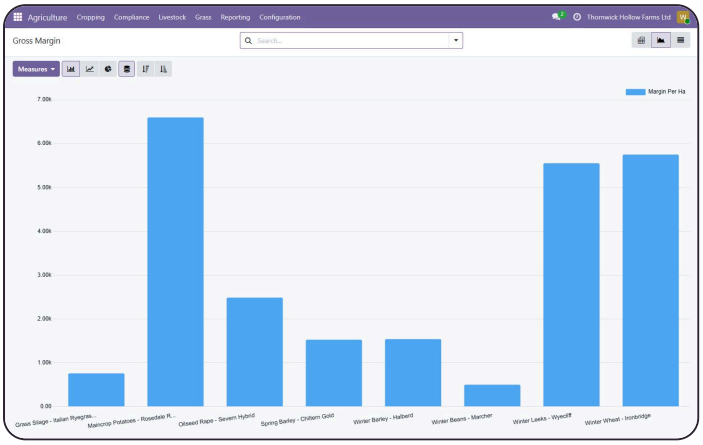

A harvested cycle under the yield alert share of its expected tonnes is flagged red, with a banner on the form: worth a look before the field is drilled again.

4

Gross Margin report

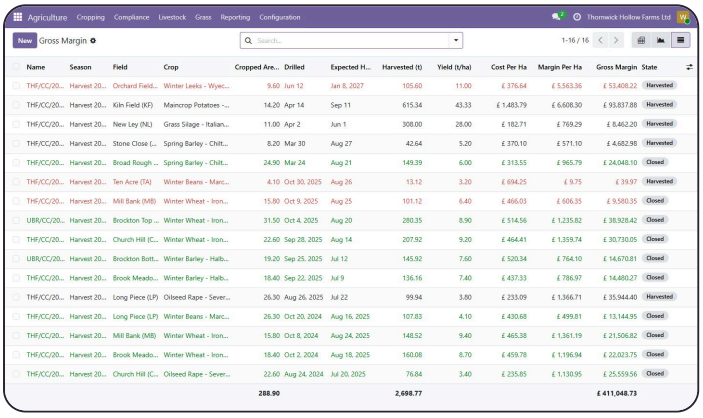

Reporting > Gross Margin (managers): harvested and closed cycles as a pivot of area, cost, revenue and margin, by season and crop.

5

Margin per hectare

The graph view.

6

The list

The same cycles one per line.

Close on a harvested cycle signs it off and posts the margin per hectare in the chatter. A season is closed with **Close Off** once no cycle in it is draft, planned or growing.

The nightly job **Farm: crops coming ready** (shipped switched off) posts a note on every growing cycle due off within the look ahead days and mails the farm manager.

PART 9 Herds and animals

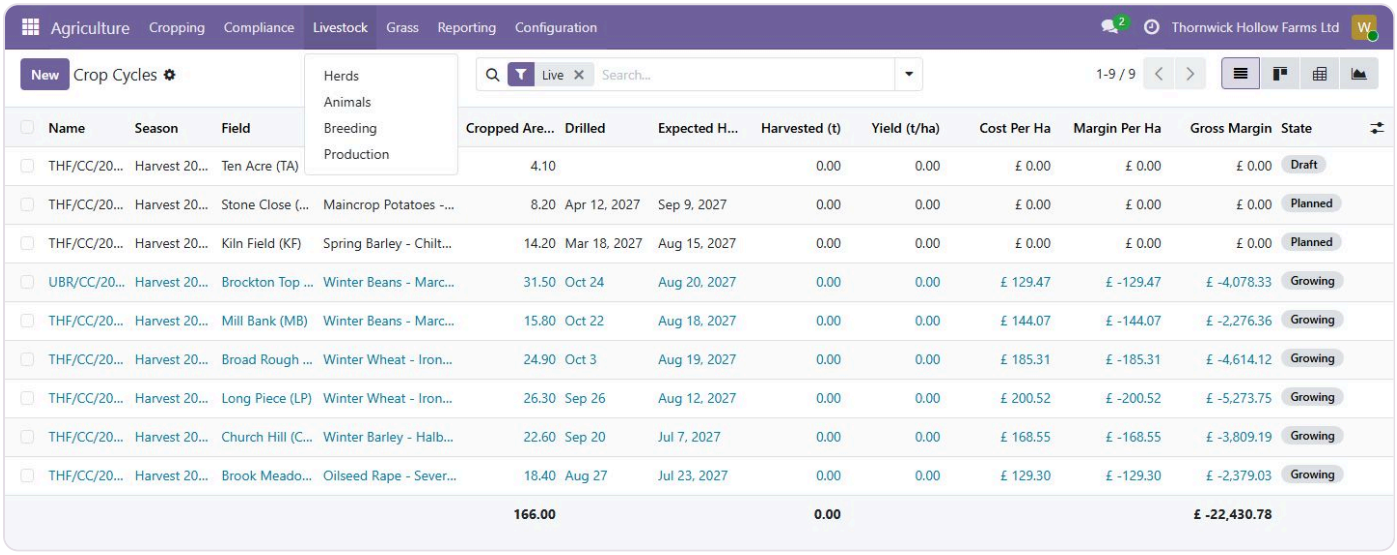

Herds and flocks, with every animal under them on its official ear tag, its weights and its pedigree.

IN THIS PART YOU WILL LEARN

- Herds and what they count
- An animal: tag, pedigree, weights and daily gain
- Selling, culling and recording a death

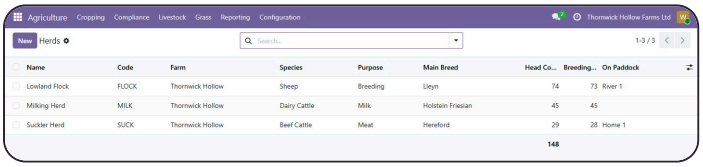

TRY IT YOURSELF ON THE DEMO

1. Livestock > Animals, filter In Calf
2. Open a cow and read her Breeding and Weights tabs

Agriculture > Livestock: Herds, Animals, Breeding, Production.

1

Herds

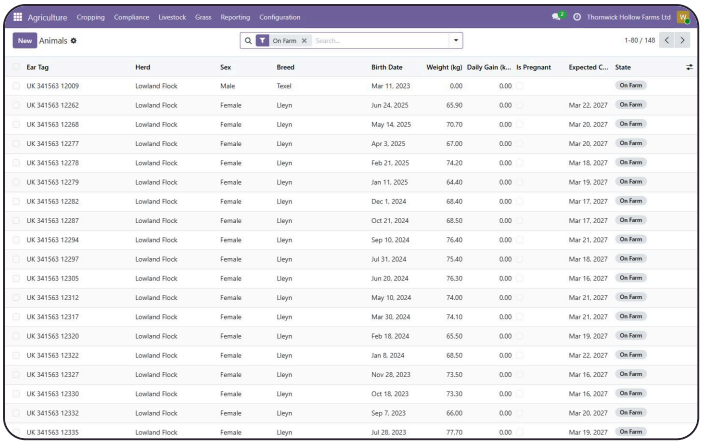

Species, purpose, main breed, stockperson, head count, breeding females and the paddock it is on now.

2

A herd

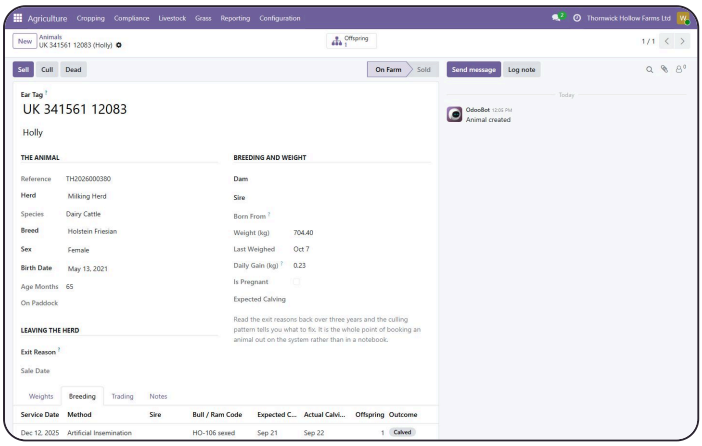

Tabs for the animals, grazing and production, and stat buttons for both. The main breed is suggested on every animal added.

3

Animals

On Farm by default. Filters In Calf, Females, Left the Herd and Calving Within a Month; group by herd, species, sex, status or paddock. In calf animals are blue, gone ones grey.

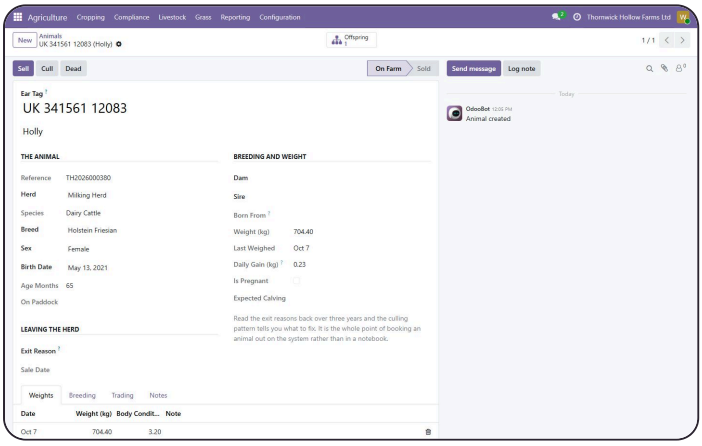

4

An animal

Reference (prefix + number), the official ear tag (unique per company), a name, breed, sex, birth date and age, dam and sire, and the service it was born from. The Breeding tab lists her services; Offspring opens her calves.

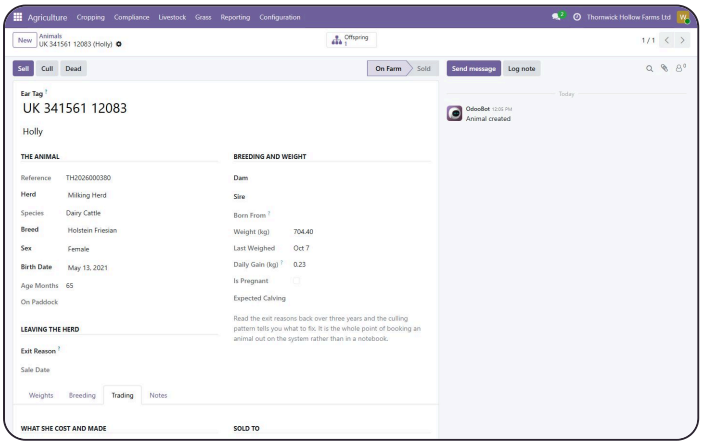

Dam and sire must be female and male, older than the animal and not the animal itself; a birth date in the future is refused.

5

Weights

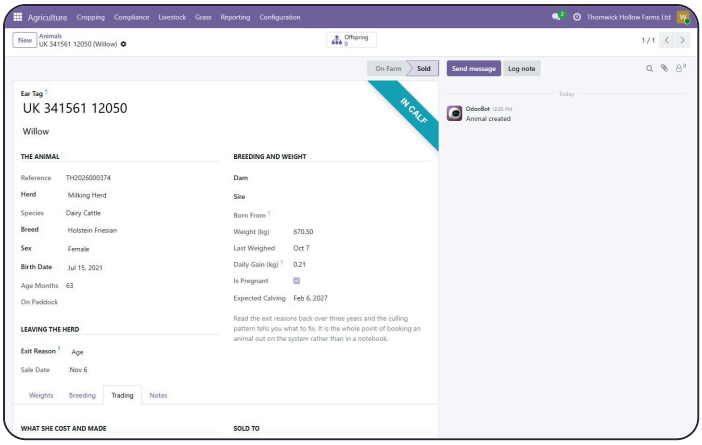

Each weighing with a body condition score from 1 to 5, one per day. Daily gain is worked out between the first and the last weighing.

6

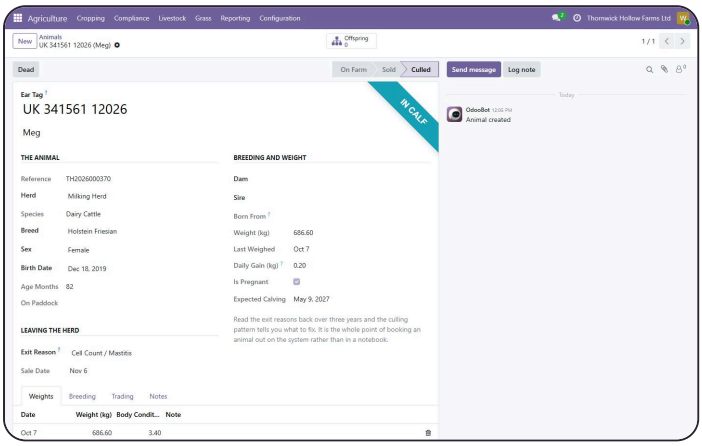

Trading

Purchase price, sale price, sale date and buyer, visible to farm managers only.

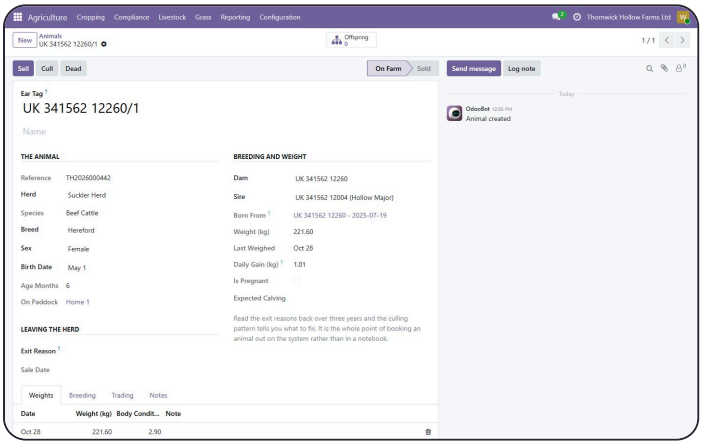

7 Sold

Sell needs a sale price on the Trading tab, so the herd margin means something. It stamps the sale date.

8 Culled

Cull and Dead each need an exit reason (age, fertility, cell count, lameness, finished, injury, disease, other). Read over three years, the reasons say what to fix.

9 A calf

Created by the calving record with the dam, sire and the service already filled.

PART 10 Breeding and production

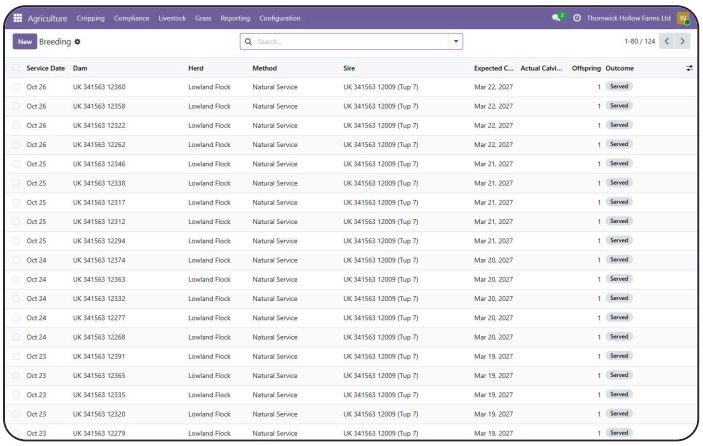

Services with the expected calving worked out by species, calvings that create the calves, and a daily production log for milk, eggs and wool.

IN THIS PART YOU WILL LEARN

- Served, in calf, not in calf, aborted and calved
- Recording a calving
- The production log and per head figures

TRY IT YOURSELF ON THE DEMO

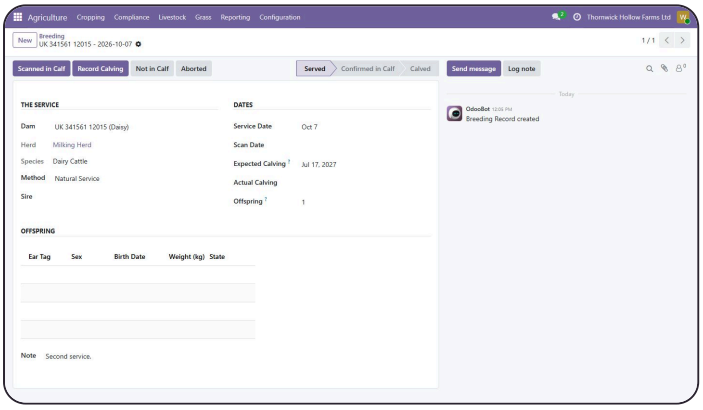

1. Livestock > Breeding, filter Waiting on a Scan
2. Livestock > Production, switch to graph

1

Breeding

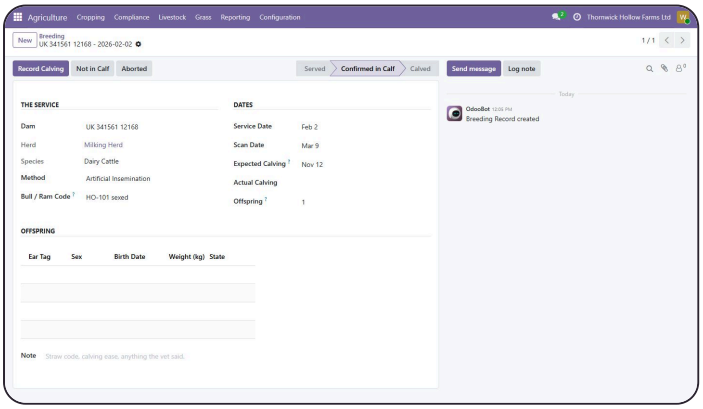

Every service: dam, sire or bull/ram code, method (natural, AI, embryo transfer), service date, expected calving, scan, outcome. Filters In Calf, Waiting on a Scan, Calved and Not in Calf.

2

Served

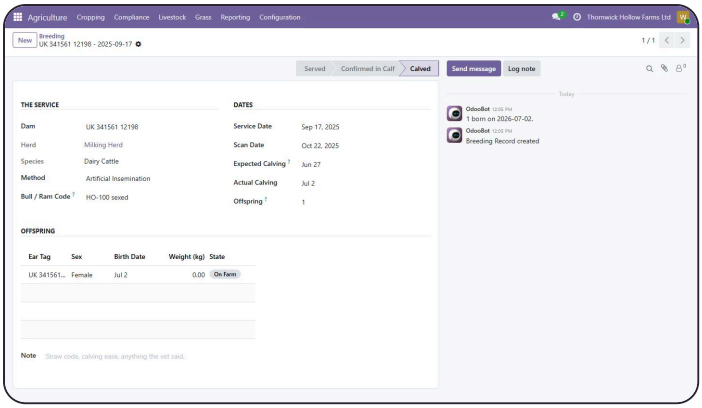

Expected calving = service date + the gestation for the species: cattle 283 days, sheep 147, goats 150, pigs 114, poultry 21. Move it if a scan says otherwise.

3

Scanned in calf

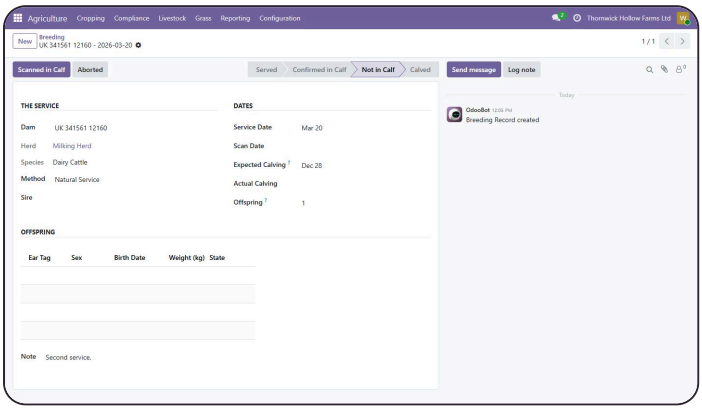

Scanned in Calf stamps the scan date. The cow shows as in calf with her expected calving.

4 Calved

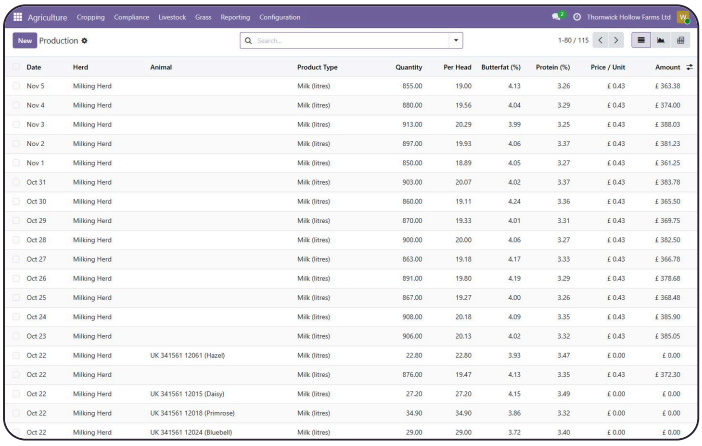

Put the actual calving date and the number born alive, then Record Calving: the calves are created in the herd with dam, sire and birth date, alternately female and male, and the outcome becomes Calved.

Adjust each calf's sex afterwards if needed.

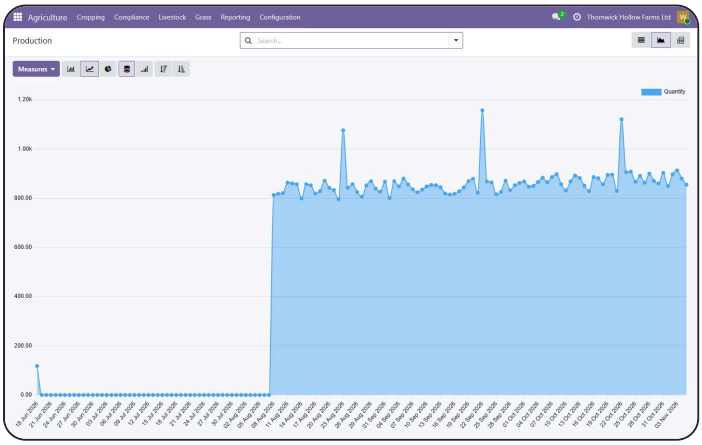

5 Not in calf

Not in Calf and Aborted close the service. A calved service cannot be turned back.

6 Production

Milk in litres, eggs in dozens, wool in kg, or other: per herd (a bulk tank figure) or per animal (milk recording), with butterfat, protein, cell count and price. One figure per herd, animal, day and product.

7 The trend

Production over time. The peaks are the milk recording days, added on top of the bulk tank. Per head divides a herd figure by the head count.

The nightly job **Farm: calvings due** (shipped switched off) posts a note on every animal due within the look ahead days, marking the overdue ones.

PART 11 Paddocks and grazing

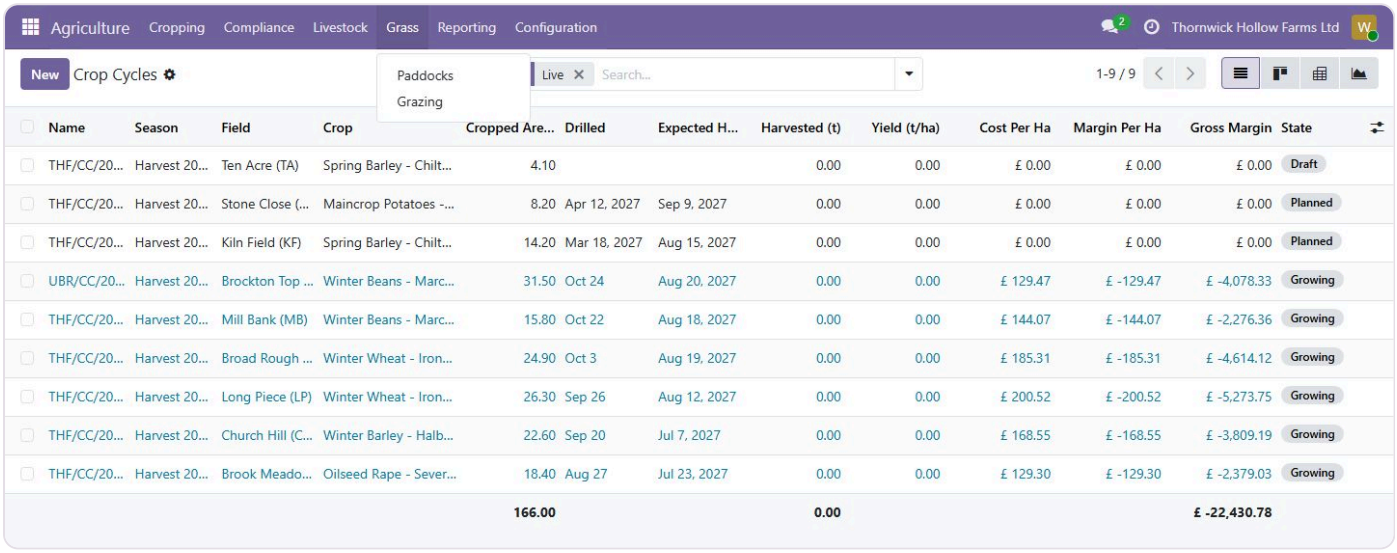

Paddocks with a rest clock and a stocking limit, and grazing blocks that move a herd on and off them.

IN THIS PART YOU WILL LEARN

- A paddock and its rest days
- Turning in and taking off
- What the rules refuse

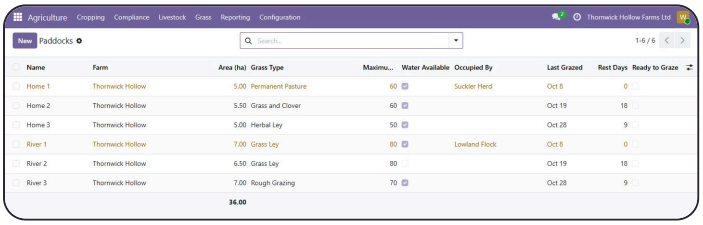

TRY IT YOURSELF ON THE DEMO

1. Grass > Paddocks: which are occupied and which are rested
2. Grass > Grazing, filter Overdue Off

Name	Season	Field	Crop	Cropped Are...	Drilled	Expected H...	Harvested (t)	Yield (t/ha)	Cost Per Ha	Margin Per Ha	Gross Margin	State

				166.00			0.00				£ -22,430.78	

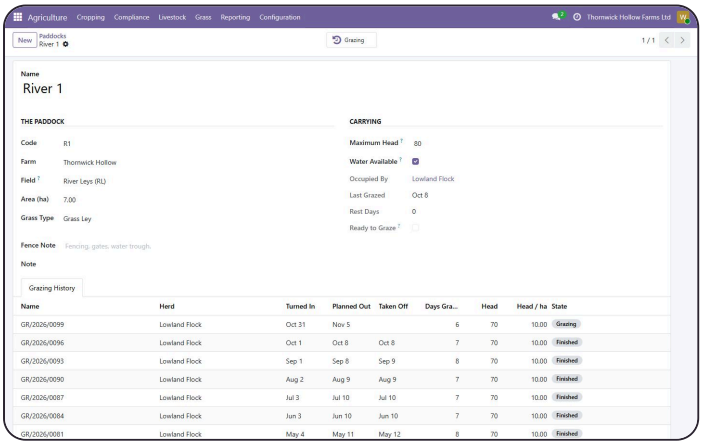

Agriculture > Grass: Paddocks and Grazing.

1

Paddocks

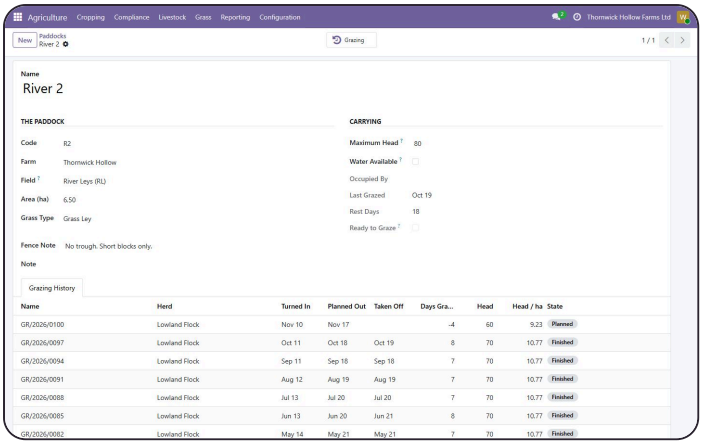

Area, sward, water, maximum head, who is on it, last grazed, rest days and Ready to Graze. Occupied ones are amber, ready ones green. Filters Ready to Graze, Stock On and No Water.

2

A paddock

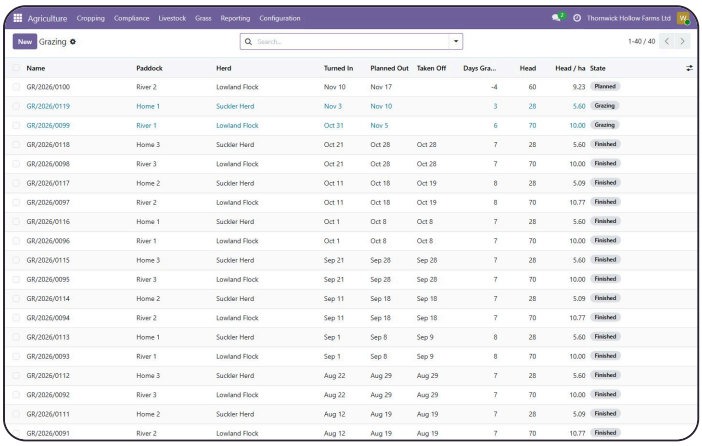

Optionally a fenced block of a field (and no bigger than it), the sward type, water, the stocking limit and a fence note. The Grazing History tab lists every block.

3

No water

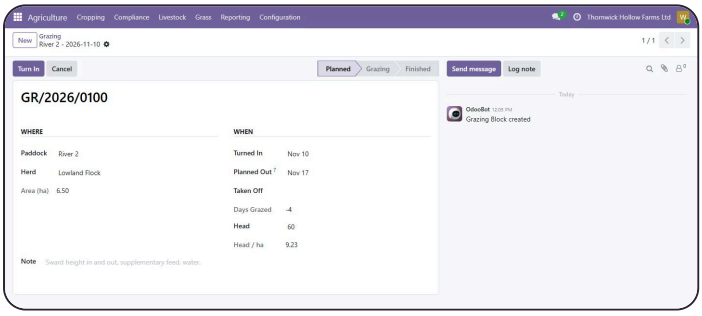

No trough, no stock for long: the first thing anyone checks before a move.

4

Grazing

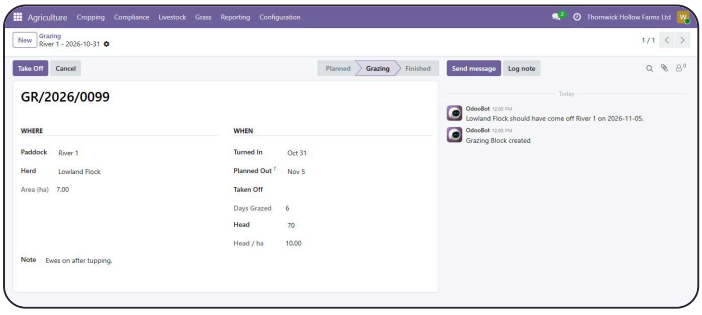

Every block: paddock, herd, turned in, planned out, taken off, head, days and head per hectare. Filters Out Now, Planned and Overdue Off.

5

Planned

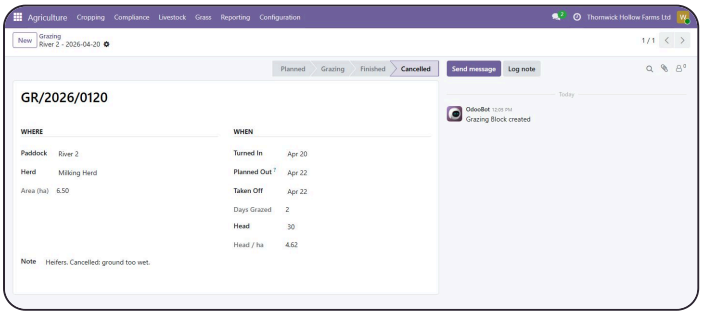

Turn In is refused if the paddock has not had the minimum rest since it was last grazed, or another herd is on it.

6

Out now

Take Off stamps the date off (today if empty). The nightly job **Farm: paddock rest and overdue grazing** refreshes the rest days and posts a note on any block past its planned date out, as here.

7

Cancelled

A finished block cannot be cancelled: the next herd's rest depends on it.

REFUSED	BECAUSE

More head than the paddock carries	Overstocking wrecks the sward for a season
Two blocks on one paddock at the same time	Two herds cannot share it
Turning in before the minimum rest	Grazing too soon takes the sward out
Taking off before turning in	The dates have to make sense

A planned block with no date off counts as occupying its paddock for a year when other blocks are checked for overlap. Put a planned date off and a date off on short planned blocks.

PART 12 Printed documents

Four printouts: the margin for the accountant, the passport for the buyer, and two records for the inspector.

Spray Record

From a pass, A4 landscape: field, date, operator, wind, then each product with active substance, batch, quantity, rate, target, interval and clear date.

PART 13 A fifteen minute walk-through

If you have the demo open and fifteen minutes, this path shows the whole farm.

#	DO THIS	AND NOTICE
1	Configuration > Fields	*Fifteen fields with their area, soil and what is in each one.*
2	Crop Cycles, kanban	*Harvest 2027 in the ground, 2026 harvested or closed.*
3	Open the 2026 wheat on Church Hill, Margin tab	*Five cost headings, shrunk tonnes, margin per hectare and per tonne.*
4	Its Field Work tab	*Every pass that built the cost.*
5	Compliance > Intervals Running	*Which fields cannot be cut yet, and until when.*
6	Harvests, open the draft leek load	*Why Confirm would be refused today.*
7	Field Work, the planned spray on Kiln Field	*A 24 kph wind reading over the 15 kph limit.*
8	Harvests, a paid wheat load, Traceability tab	*Every product on that ground, with batch numbers.*
9	Print the Harvest Passport	*The answer to a residue query.*
10	Reporting > Gross Margin	*Margin by season and crop.*
11	Livestock > Animals, filter In Calf	*Who is due, and when.*
12	Open a cow, Breeding and Weights tabs	*Services, calves and daily gain.*
13	Livestock > Production, graph	*Ninety days of bulk tank litres.*
14	Grass > Grazing, filter Overdue Off	*The flock should have come off yesterday.*
15	Configuration > Seasons > Harvest 2025	*A closed year that no longer moves.*

PART 14 Questions people ask

Short answers, all from what the module does.

QUESTION	ANSWER
Does it need Odoo Enterprise?	No. Odoo 19 Community with Inventory and Accounting, both installed with it.
Can it stop a harvest before the interval is up?	Yes, Confirm is refused while an interval runs on the field (a setting).
Does it stop an over-dose?	Yes, a line above the product's maximum dose per hectare is refused.
And spraying in wind?	Yes, above the maximum spray wind a spray cannot be booked as done.
Is the harvest invoiced on the weighbridge weight?	No, on the tonnage shrunk to the target moisture.
Does the store balance?	With stock tracking on, inputs leave the farm store and harvests enter the grain store as done stock moves.
Can workers see costs?	They see their own passes; margins, prices and certificates are for managers.
Does it print the spray record?	Yes, plus the field record sheet, the harvest passport and the margin sheet.
Can I run a rented block as a second farm?	Yes, farms are separate records with their own code.
Does it fill in subsidy claims?	No. Holding and parcel references are kept for them.
Is there a map?	No. Fields have an area and a colour.
Does it handle pigs or poultry?	The species exist, with gestation figures, but the demo shows cattle and sheep.

PART 15

The menu map

Every screen in the module, on one page.

Cropping

Crop Cycles	One crop, one field, one season: costs, yield, margin
Field Work	Every pass, costed, with its inputs
Harvests	Loads, moisture shrink, lots, invoices

Compliance

Input Applications	The statutory application record
Intervals Running	Fields that cannot be cut yet
Weather Log	Rain, temperature, wind per field per day

Livestock

Herds	Herds and flocks
Animals	Ear tag, pedigree, weights, exits
Breeding	Services, scans, calvings
Production	Milk, eggs, wool

Grass

Paddocks	Rest days, stocking limit, water
Grazing	Blocks on and off

Reporting

Gross Margin	Managers: margin by season, crop, field

Configuration

Settings	Rates, limits and rules
Farms	Holdings, stores, sales journal
Fields	Area, parcel, soil, pH
Crops	Varieties, growing days, targets
Seasons	Harvest years

Want this on your farm?

We load your fields with their parcel references, your crops, inputs and rates, your herds and paddocks, connect the stores and the sales journal, and train the office and the people who book the passes.
