COMPLETE GUIDE · SETUP, THE WINDOWS AGENT AND EVERY SCREEN

WT Work Tracker for Odoo 19

A small Windows agent notes which application is in front and whether the PC is in use, and Odoo turns that into categories, effort, focus sessions, tasks, suggested timesheets and the gap against attendance. Never keystrokes. Every screen and every step, shown on a live demo.

CORE | WINDOWS AGENT | PROJECT | TIMESHEETS | ATTENDANCE

START

About this guide

WT Work Tracker answers one question a manager of office work keeps asking: where did the hours go? It does that without reading what anyone types. This guide sets it up from an empty database, installs the Windows agent on a PC, and then walks through every screen, every setting and every report.

Who it is for

The owner or HR person deciding whether to use activity tracking, the administrator who sets it up, the team lead who reads the reports, and the employee who wants to know exactly what is recorded about them.

How to read it

Front to back the first time. Parts 3 to 7 are the setup, Parts 8 to 14 the daily screens, Parts 15 to 18 the bridges to Project, Timesheets and Attendances, and Parts 19 and 20 privacy and the weekly mail. Every part opens with what you will learn and something to try on the demo.

The live demo

Meridian Facilities Management, a worked example company with four tracked people (Farhan, Nadia, Hamza and Ayesha), four paired laptops and a working week of activity from 18 to 24 September 2026 already rolled up.

HOW IT WORKS

The demo company

Address	**facility-demo.way4tech.com**
Sign in	**w4demo** / **Demo2026**
Tracked people	Farhan Malik (Operations Manager), Nadia Rahman (Odoo Developer), Hamza Sheikh (UI/UX Designer), Ayesha Qureshi (Customer Support Agent)
Data	1,492 segments, 118 events and 20 daily summaries, 18 to 24 September 2026
Runs on	Odoo 19, with Project, Project Pro, Timesheets and Attendances installed

The shared demo login is a Work Tracker **User**, so it sees only its own activity, which is none. Ask us for the manager login to see the team screens shown in this guide. The demo is shared and resets from time to time: look around, but treat it as somebody else's company.

A few screens in this guide (Settings, Screenshots, the attendance gap, task effort and suggested timesheets) show figures the live demo does not hold. Those pictures come from a test database seeded with the same four demo people and are labelled where they appear.

What is in the guide

PART 1	What a work tracker records, and what it does not	PART 2	Signing in and finding your way
PART 3	Settings from zero	PART 4	Inviting employees and pairing codes
PART 5	Installing and pairing the Windows agent	PART 6	Devices
PART 7	Rules and categories	PART 8	How segments become a day
PART 9	My Activity: one person, one day	PART 10	Work History: one person over weeks
PART 11	Team: the whole company, day by day	PART 12	Segments: the raw material
PART 13	Screenshots	PART 14	Events, the sync log and rebuilding
PART 15	Tasks: the Project bridge	PART 16	Project Pro: effort on the board

PART 17	Suggested timesheets	PART 18	Attendance and the gap
PART 19	Privacy, consent, retention and deletion	PART 20	The weekly digest
PART 21	A 15-minute demo, questions, and the menu map		

PART 1 What a work tracker records, and what it does not

CORE WINDOWS AGENT

Before anything is installed, everybody involved should understand what this product looks at. It is a time and focus tool, not a surveillance camera, and it is built so that the employee can see exactly what the manager sees.

IN THIS PART YOU WILL LEARN

- The two halves: a Windows agent on each PC and the Odoo module that holds everything else
- What one segment is, and how segments become a day
- What is captured, what is never captured, and when nothing is captured at all
- The five modules and what each adds
- The two access levels, User and Manager

TRY IT YOURSELF ON THE DEMO

1. Sign in to the demo and open the Work Tracker app from the home screen
2. Open My Activity: as the shared login you will see an empty day, because nothing was tracked for you
3. Look at the menu bar: My Activity, Work History, Segments and Screenshots

Two halves

The agent is a small tray program for Windows. Every few seconds it notes which application is in front (for example *EXCEL.EXE*), the title of that window, and whether the keyboard or mouse has been used recently. It joins those samples into stretches of time called **segments**, keeps them in a local queue and posts them to your Odoo once a minute. It has no screens of its own beyond pairing, consent and a small settings window.

The module holds everything else: the invite, the devices, the rules that decide whether Excel counts as productive, the daily summaries, the reports, the employee's own page and every privacy control. The agent asks Odoo for its settings, so a change in Odoo reaches every PC on its next sync.

From a window on the PC to a number in a report CORE WINDOWS AGENT

What is captured

Captured	Never captured
The executable name of the window in front (chrome.exe)	Keystrokes or anything typed
The window title, unless the company turns titles off	Clipboard, files, mouse positions
Idle or not: was the last input older than the idle limit	Microphone or camera
A count of one-second checks that saw new input, per segment	Web addresses beyond what a window title shows
The task picked in the tray	Anything while paused, in private mode, locked or asleep
Pause, resume, private mode, lock, unlock, sleep, wake, start, quit	
Hostname, Windows version and Windows user name, once, at pairing	
Screenshots only if the company turns them on, scaled and blurred on the PC first	

The five modules

Module	Technical name	Price	What it adds
WT Work Tracker	wt_work_tracker	USD 199	Everything in Parts 3 to 14 and 19 to 20. Needs only Employees.
Work Tracker: Project	wt_work_tracker_project	Free, installs itself	Tasks on segments, the tray task list, effort per task, Working on this. Part 15.
Work Tracker: Project Pro	wt_work_tracker_project_pro	Free, installs itself	Tracked column on the Project Pro board and item pages. Part 16.
Work Tracker: Timesheets	wt_work_tracker_timesheet	Free, installs itself	Suggested timesheet lines from effort per task. Part 17.
Work Tracker: Attendance	wt_work_tracker_attendance	Free, installs itself	Attendance hours next to tracked time, and the gap. Part 18.

The four bridges are marked *auto install*: they appear the moment both of their parents are installed. Install Project after the tracker and the Project bridge follows on its own. The agent is a separate free download from way4tech.com.

Two access levels

Level	Sees	Can do
User: own activity	Their own segments, days, devices and screenshots	Read their own pages, unpair their own device, ask HR to delete their data. The agent signs in at this level.
Manager: whole company	Every employee of the company	Invite, generate codes, revoke devices, write rules and categories, rebuild days, suggest timesheets
Settings (Administrator)	As Manager	Also opens Work Tracker Settings. An administrator is a Manager automatically.

> There is no team level. A Manager sees the whole company, not only their own department. Give the Manager level to the people who should see everyone, and leave team leads as Users if that matters to you.

PART 2 Signing in and finding your way

CORE

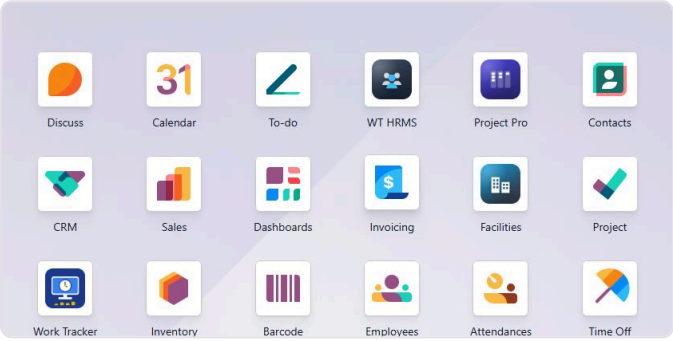

Work Tracker is one app on the Odoo home screen with five menus. Which of them you see depends on your level.

IN THIS PART YOU WILL LEARN

- How to open the app and what each menu is for
- What a User sees and what a Manager sees
- Where the settings live

TRY IT YOURSELF ON THE DEMO

1. Open the home screen and click Work Tracker
2. Open Segments and remove the Today filter to see whether you have any rows

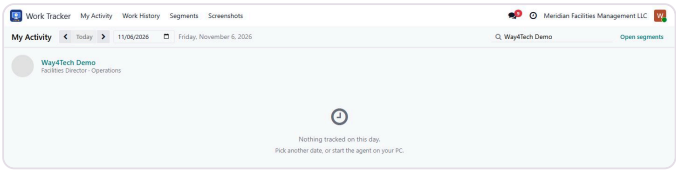

1 CORE

Open the app

Sign in at the demo address and click **Work Tracker** on the home screen. The app opens on My Activity, the employee's own day.

Every internal user with the User level sees the icon.

2 CORE

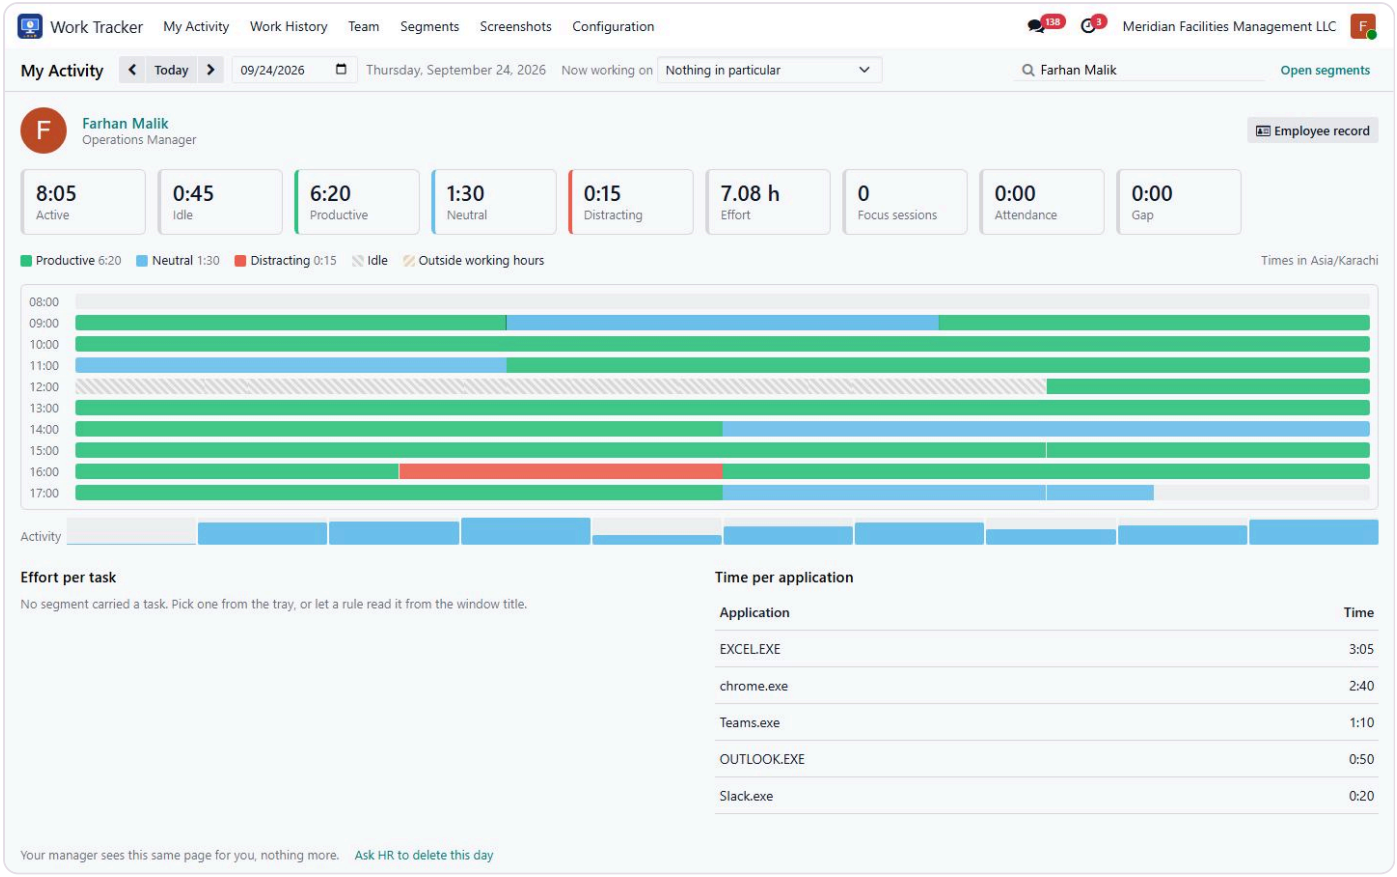

An empty day

The shared login has no paired PC, so its page says *Nothing tracked on this day. Pick another date, or start the agent on your PC.* When there is data on an earlier day, the page jumps to the latest day that has some.

The menus

Menu	Who	What it is for
My Activity	User	One day for one person: tiles, an hour by hour timeline, effort per task, time per application
Work History	User	One person over 7, 14 or 30 days, day by day
Team > Today / Days / Tasks effort	Manager	Daily summaries for everyone: kanban, list, graph and pivot
Segments	User	Every stretch of time in one window, the raw material
Screenshots	User	Blurred captures, only when the company has turned them on
Configuration	Manager	Rules, Categories, Devices, Pairing codes, Events, Sync log, Rebuild, Settings

Configuration > Settings opens only for an administrator. The rest of Configuration is for Managers. A User sees My Activity, Work History, Segments and Screenshots, each limited to their own rows by record rules, so even a list with no filter shows nothing of anybody else's.

CORE My Activity as the manager Farhan Malik, landing on Thursday 24 September, the latest day with data.

PART 3 Settings from zero

CORE

Every tracker setting is a company setting that the agent receives over the network. Change one in Odoo and each PC picks it up on its next sync, because a counter on the company moves with every change and the device compares it with the version it last fetched.

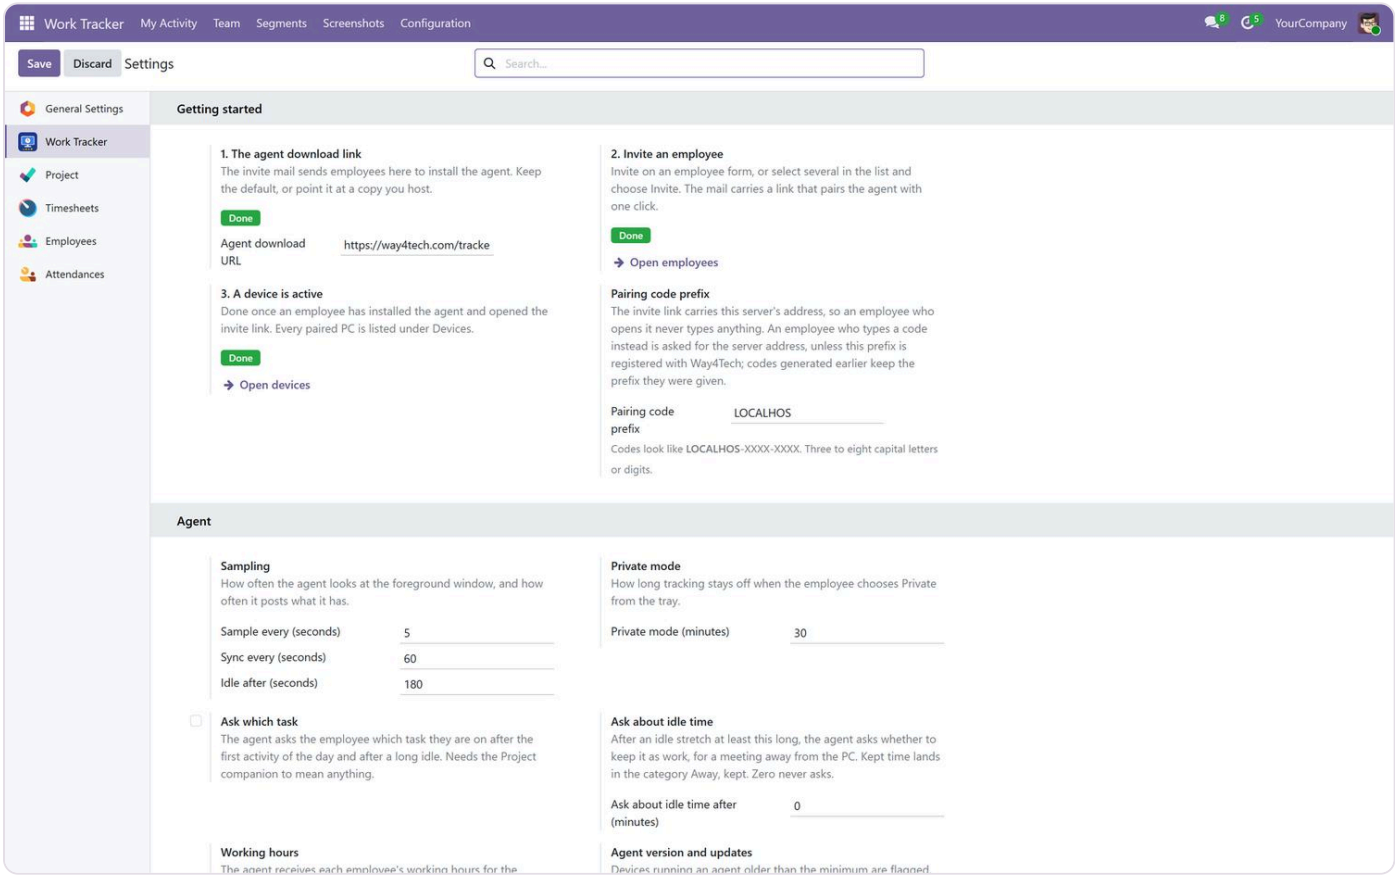

IN THIS PART YOU WILL LEARN

- The three Getting started steps and how they tick themselves off
- The pairing code prefix and where it comes from
- Every agent, privacy, classification and report setting, with its default and its limits
- How an employee form overrides the working hours setting

TRY IT YOURSELF ON THE DEMO

1. Settings is administrator only, so on the demo read this part alongside the screens below
2. With a manager login, open Configuration and note that Settings is the last item

Open **Work Tracker > Configuration > Settings** (or Settings > Work Tracker). The page has five blocks: Getting started, Agent, Privacy, Classification and Reports.

CORE Getting started and Agent. Pictured on a test database; the live demo's shared login cannot open Settings.

Getting started

1 CORE

1. The agent download link

The invite mail sends employees here to install the agent. The default is **https://way4tech.com/tracker/download**, which always points at the latest signed installer. Keep it, or point it at a copy you host. Blank falls back to the default, so an invite never goes out without a link.

The badge turns from To do to Done on its own.

2 CORE

2. Invite an employee

Done once any invite has been sent. **Open employees** takes you to the employee list, where Invite sits on each form and in the list's action menu.

3 CORE

3. A device is active

Done once one employee has installed the agent and paired it. **Open devices** lists every paired PC.

4 CORE

Pairing code prefix

The first group of every code, such as **ACME** in ACME-7K3M-92QA. Odoo derives it from the server address the first time a code is needed (erp.acme-trading.com gives ACMETRAD) and stores it. You may change it: three to eight capital letters or digits. Codes made earlier keep the prefix they were given.

The prefix matters only when somebody types a code by hand; see Part 5.

Agent

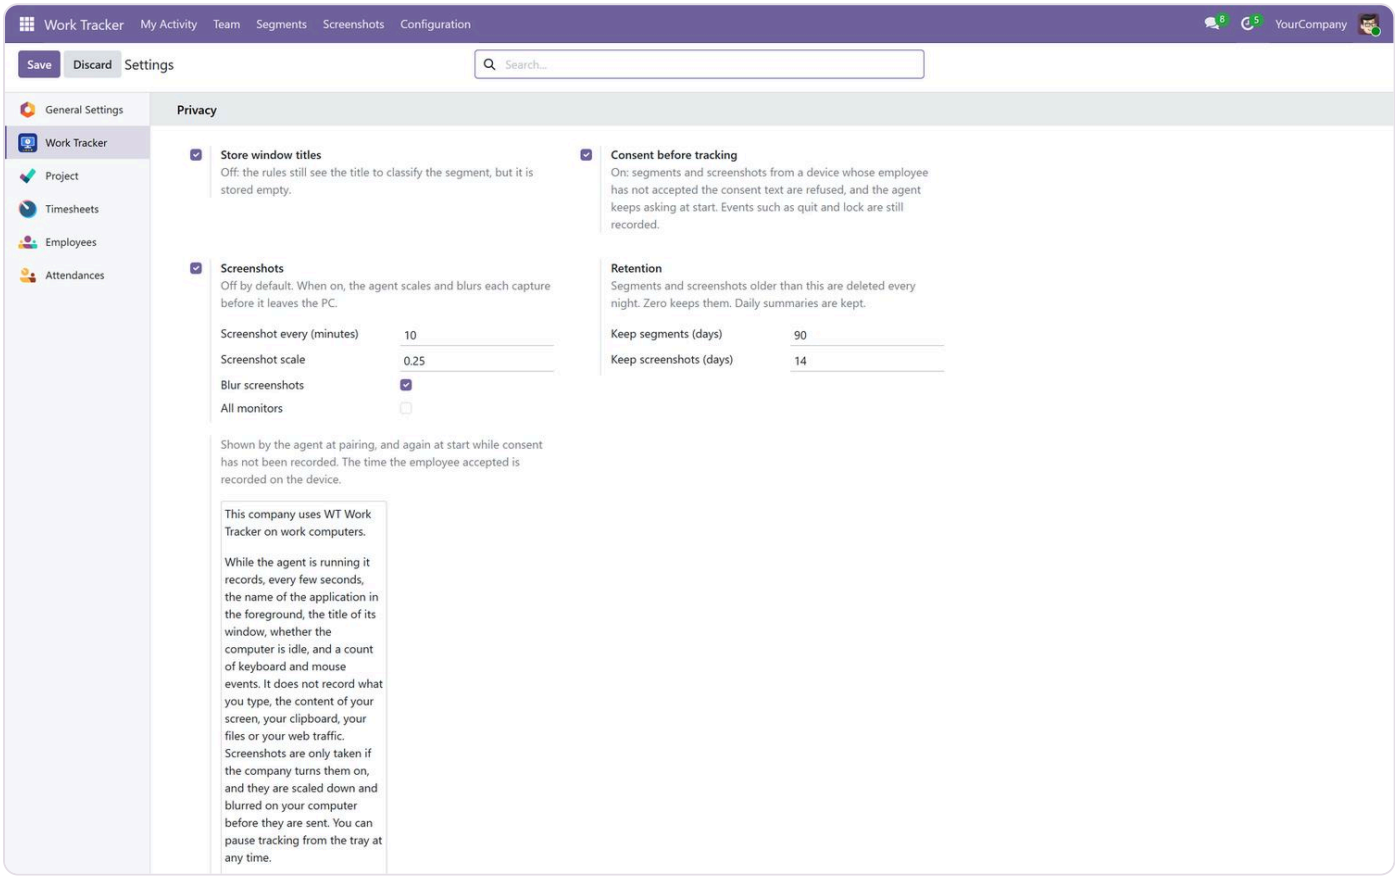

Setting	Default	Allowed	What it does
Sample every (seconds)	5	2 to 60	How often the agent reads the window in front
Sync every (seconds)	60	15 to 3600	How often it posts what it has queued
Idle after (seconds)	180	30 to 3600	No input for this long and the segment counts as idle
Private mode (minutes)	30	1 to 1440	How long Private mode in the tray switches tracking off
Ask which task	Off		The agent asks "Still on this task?" after the first activity of the day and after a long break. Useful only with the Project bridge
Ask about idle time after (minutes)	0	0 to 1440	After an idle stretch at least this long, ask whether to keep it as work. Kept time goes to the category Away, kept. Zero never asks
Working hours	Track whenever the agent runs	3 choices	See below
Minimum agent version	1.0.0		Devices on an older agent are flagged as outdated
Agent update URL	way4tech.com/tracker/latest.json	https	Where the agent checks for a newer version once a day

Working hours

The agent receives each employee's working hours for the next seven days, taken from the employee's working schedule in Odoo. Three modes:

Mode	Effect
Track whenever the agent runs	No schedule is sent. Everything counts.
Pause outside working hours	The agent captures nothing outside the schedule.
Track, but mark time outside working hours	Time outside is captured and flagged Outside working hours. It shows on the timeline but counts for nothing in the totals.

On an employee form (Tracker tab, managers only) the field **Tracker working hours** overrides the company choice for that one person, with a fourth value, *As the company*, the default. An employee with no working schedule has no hours, and the agent tracks whenever it runs.

CORE Privacy: titles, consent, screenshots, retention and the consent text. Test database.

Privacy, classification and reports

Setting	Default	What it does
Store window titles	On	Off: the agent never sends titles, so rules on the title never match and only application rules classify time
Consent before tracking	On	Segments and screenshots from a device whose employee has not accepted are refused. Events are still recorded
Screenshots	Off	When on: every 10 minutes, scale 0.25 (0.1 to 1), blur on, main monitor only unless All monitors is ticked
Keep segments (days)	90	Older segments are deleted every night. Zero keeps them. Daily summaries are kept
Keep screenshots (days)	14	Older screenshots are deleted every night. Zero keeps them
Consent text	Provided	Shown by the agent at pairing and at start until accepted. Sent as plain text
Default category	Neutral	The category of a segment no rule matches
Weekly digest	Off	Every Monday, last week per employee to the recipients you pick. Part 20

Timesheet rounding (minutes)	15	Timesheets bridge only, 1 to 240. Part 17

> Out of range values are refused with a message that names the limit, for example *Sync every (seconds) is between 15 and 3600.*

PART 4 Inviting employees and pairing codes

CORE

A PC is connected to one employee by a one-time pairing code. The easy way is an invite: one click on the employee form sends a mail with a link that pairs the agent without typing anything.

IN THIS PART YOU WILL LEARN

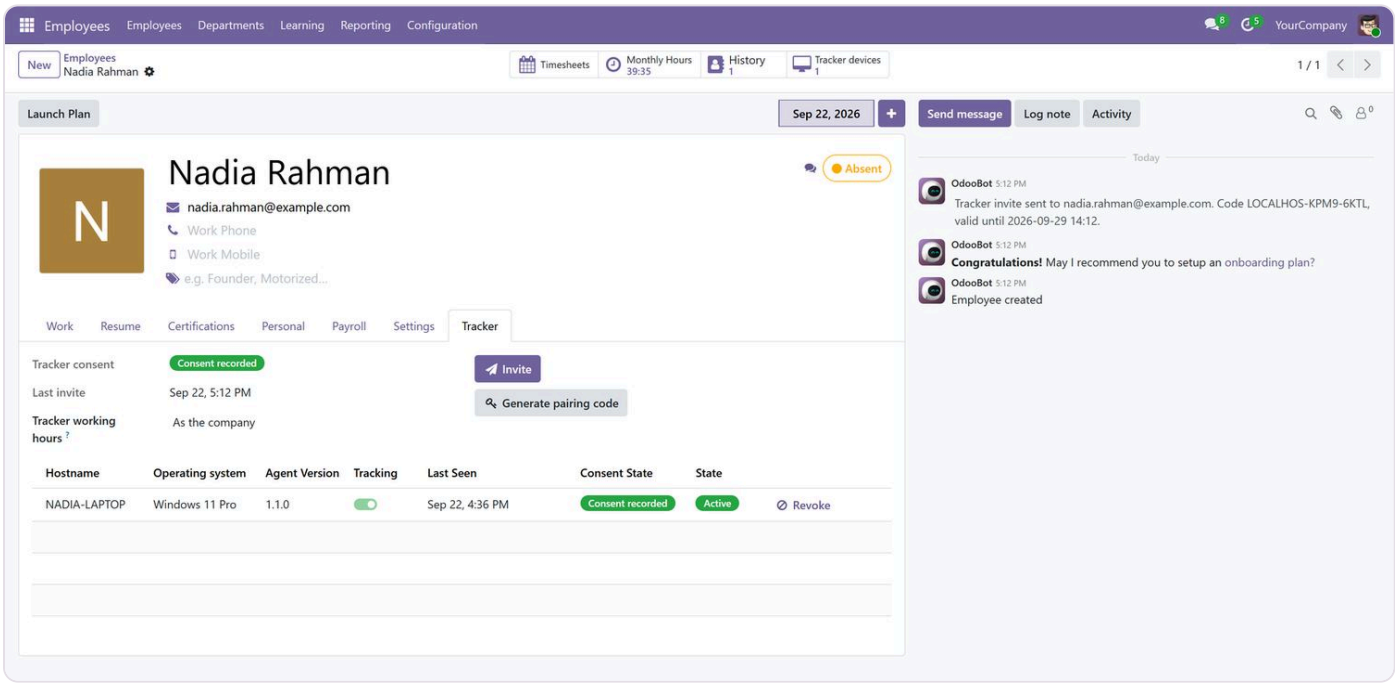

- Why the employee must have a user, and what Invite does to that user
- Invite from one form or for many employees at once
- What the mail and the WhatsApp text say
- Generate pairing code for a code read out on the phone
- The pairing code list: open, used, expired

TRY IT YOURSELF ON THE DEMO

1. With a manager login, open Configuration > Pairing codes and remove the Open filter
2. Open the code for Nadia Rahman that is marked Used, and read the Copy to the employee text
3. Do not press Invite or Generate on the demo: both create codes and send mail

Before you invite

The agent signs in as the employee's Odoo user, so every employee to be tracked needs a linked user. Invite refuses the whole selection if anyone has none and names them: *These employees have no user ... Link a user on each form first.* A manager inviting a user who lacks the Work Tracker User level grants it on the spot.

CORE The Tracker tab on an employee form: consent state, last invite, working hours override, Invite, Generate pairing code and the employee's devices with Revoke. Test database.

Invite one employee

1 CORE

Open the employee

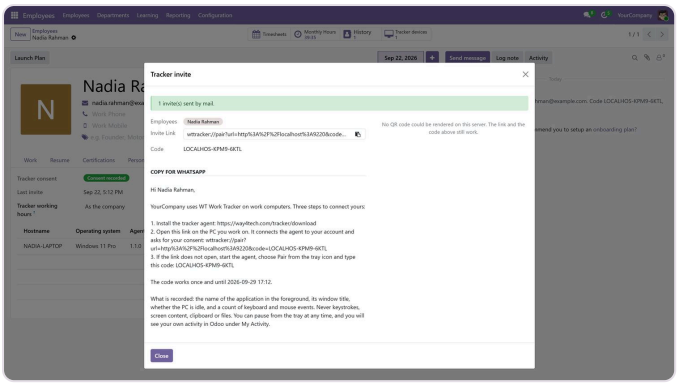

Employees, open the person, then the **Tracker** tab (managers only).

2 CORE

Press Invite

Odoo reuses an open code with at least a day left, or makes a new one that lasts **seven days**. It mails the invite to the employee's work email, stamps the code as sent, and posts a note on the employee: *Tracker invite sent to ... Code ..., valid until ...*

No work email: the note says so, and the invite window tells you to paste the message instead.

3 CORE

The Tracker invite window

It shows how many mails went out, the invite link, the code and a **Copy for WhatsApp** text with the same three steps as the mail. With one employee it also shows a QR code of the link to scan on a phone.

If the server cannot draw a QR code, it says so; the link and the code still work.

What the employee receives

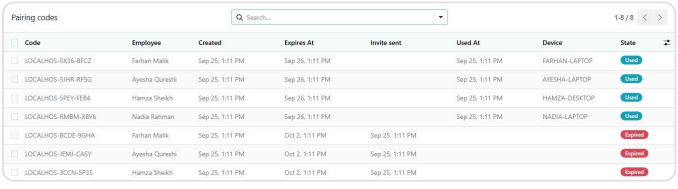

Subject: *Connect your work tracker at <company>*. Three steps: install the agent from the download link; open the **wttracker://pair** link on the PC they work on, which connects the agent and asks for consent; if the link does not open, choose Pair from the tray icon and type the code. The text ends with what is and is not recorded, and that they will see their own activity under My Activity.

Invite many at once

In the employee list or kanban, tick several employees and choose **Actions > Invite to Work Tracker**. Each gets their own code and mail; the window shows the combined WhatsApp texts and tells you to open a single employee's invite for their QR code.

A code read out on the phone

Generate pairing code on the Tracker tab makes a fresh code that lasts **24 hours** and opens it in a small window with the instructions to read out: the code, valid until, the Odoo address and the agent download link. Codes are three groups, prefix plus eight characters from an alphabet without 0, O, 1 and I so they survive being read aloud.

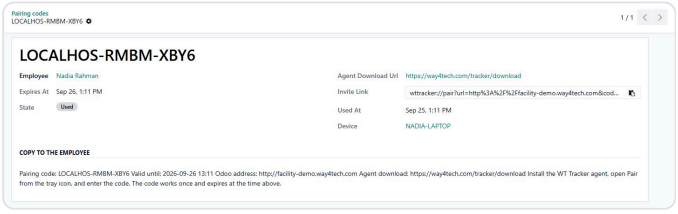

4 CORE

Configuration > Pairing codes

Every code with its employee, created, expires, invite sent, used at, the device it paired and its state. Filters: Open (the default), Used, Expired, Sent as an invite.

On the demo all eight codes are used or expired, so remove the Open filter to see them.

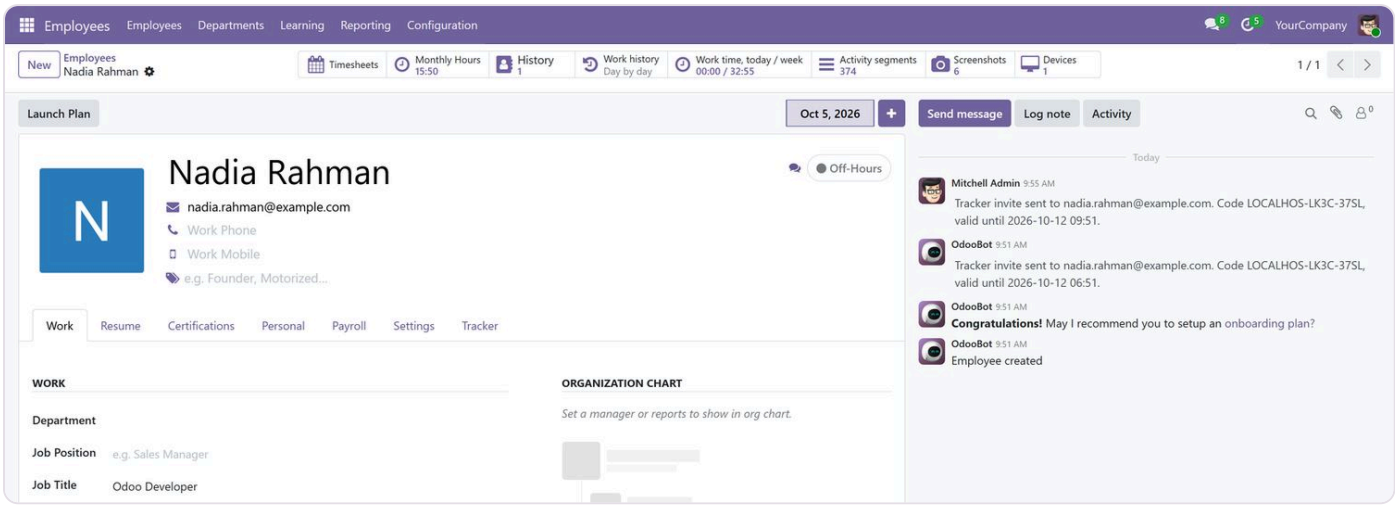

5 CORE

One code

The code, the employee, when it expires, the agent download URL, the invite link with a copy button, when it was used and by which device, and the **Copy to the employee** text.

A code works once. After pairing it shows Used and the device.

Smart buttons on the employee

CORE Work history, Work time today and this week, Activity segments, Screenshots and Devices on the employee form. Test database.

A User sees these buttons only on their own employee record; on anybody else's the counts are zero and the buttons are hidden. The employee list also gets a clock icon on each row and the kanban card menu an **Open work history** item, both opening Work History for that person.

> Archiving an employee revokes their active devices at once, with a note on each device, so a PC that outlives the employee is refused on its next call.

PART 5 Installing and pairing the Windows agent

WINDOWS AGENT

The agent is one installer that needs no administrator rights. Install it, open the invite link, accept the consent text and the tray icon turns green. This part follows the installer and the agent step by step, then covers the tray menu, updates and the command line switches IT will want.

IN THIS PART YOU WILL LEARN

- Install per user, with no admin prompt
- Pair from the invite link, or by typing a code
- The consent dialog and what Not now does
- The tray icon colours, the menu and the task picker
- Updates, the local queue, uninstall and scripted installs

TRY IT YOURSELF ON THE DEMO

1. Download the installer from way4tech.com/tracker/download on a Windows PC you may test on
2. Open the agent's Settings window from the tray after pairing and read what it shows

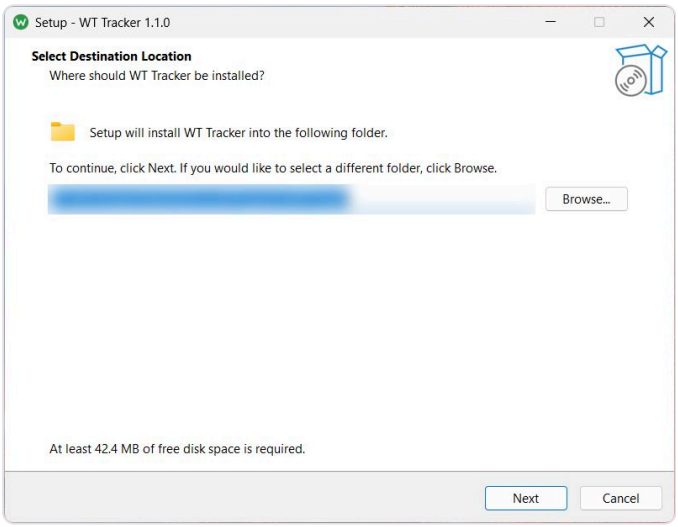

Install

1 WINDOWS AGENT

Download

Open the download link from the invite (by default way4tech.com/tracker/download). It serves the current signed installer, **WT-Tracker-Setup-<version>.exe**, about 17 MB.

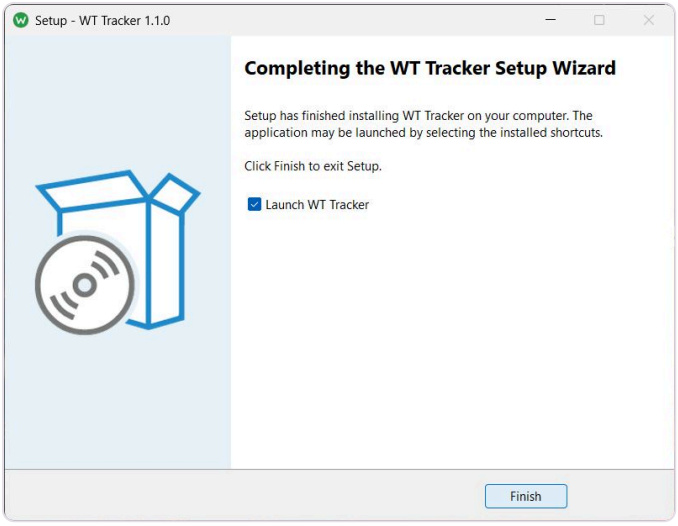

If Windows SmartScreen says it does not recognise the app, choose More info, then Run anyway.

2 WINDOWS AGENT

Run the installer

It installs for the signed-in Windows user under **%LOCALAPPDATA%\Programs\WTTracker**, so no administrator prompt appears. Click Next.

3 WINDOWS AGENT

Finish

Setup adds a Start Menu entry, registers the agent to start when the user signs in to Windows, registers the **wttracker://** link type for that user, and launches the agent.

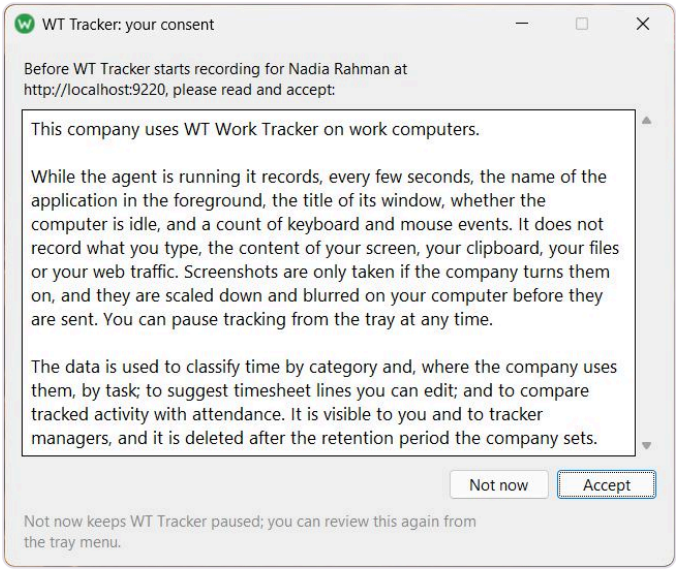

Pair from the invite link

4 WINDOWS AGENT

Open the link on the PC

Click the **wttracker://pair?url=...&code=...** link in the mail. Windows hands it to the agent, which asks first: *Connect this computer to <your Odoo address>?* A link is easy to forward, so only accept your own company's.

If the agent is already running, the link is passed to it and it pairs without a second copy starting.

5 WINDOWS AGENT

Accept the consent text

With consent required (the default), the agent shows the company's consent text and records nothing until **Accept**. Accepting is recorded on the PC and in Odoo, with a note on the device: *Consent accepted from the agent.*

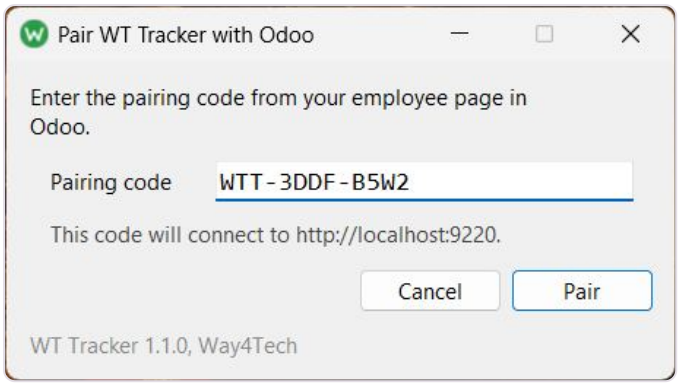

Not now leaves the agent paused with an amber icon and a Review consent item in the tray menu.

6 WINDOWS AGENT

Green

A toast says *Paired as <employee>. Tracking has started.* and the tray icon turns green. In Odoo the device appears under Configuration > Devices, marked Paired from an invite link.

Pair by typing a code

7 WINDOWS AGENT

The pairing window

When the agent is not paired, a left click on the tray icon (or **Pair with Odoo** in its menu) opens this window. Type the code from the employee page in Odoo.

8 WINDOWS AGENT

Which Odoo?

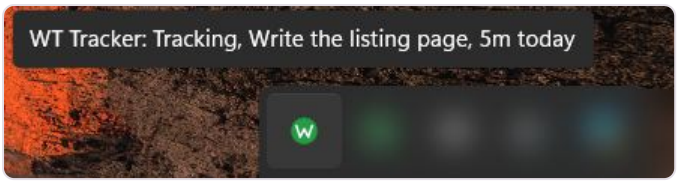

The agent looks the code's prefix up in the table Way4Tech publishes at way4tech.com/tracker/tenants.json. When the prefix is there, the window shows *This code will connect to ...*. When it is not, or the table cannot be fetched, the window also asks for the company's Odoo address.

The invite link carries the address itself, which is why it never needs this step.

Pairing guesses are limited: after 20 failed attempts from one address in 15 minutes, Odoo asks that address to wait. A code that is used answers 409 and an expired one 410.

The tray

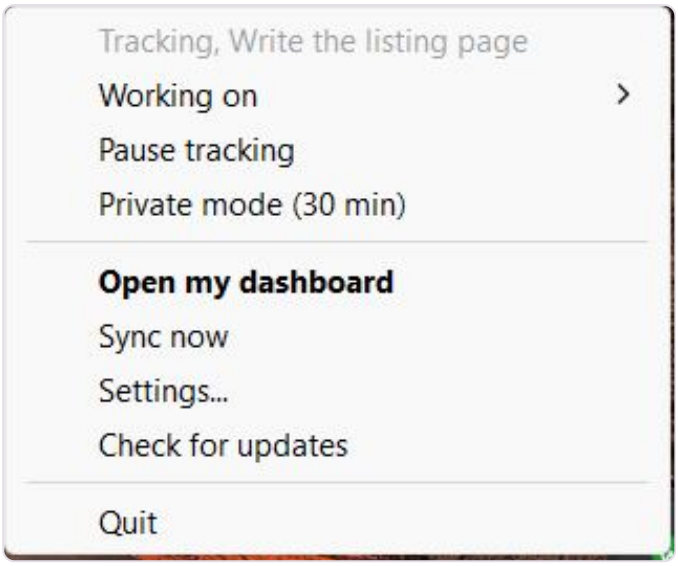

Icon	Meaning
Green	Tracking
Grey	Paused
Amber	Private mode, or waiting for consent
Red	Not paired, or the server cannot be reached

9 WINDOWS AGENT

Hover

The tooltip shows the state, the current task and today's total, such as *Tracking, Website redesign, 2h 10m today*. A left click opens My Activity in the browser.

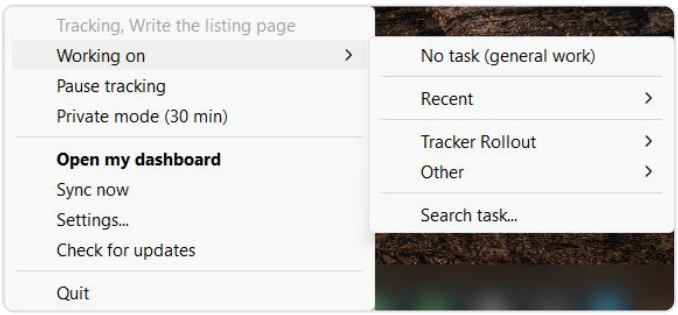

10 WINDOWS AGENT

Right-click menu

The status line, **Working on**, **Pause tracking** or **Resume tracking**, **Private mode (30 min)** (the minutes come from Odoo), **Open my dashboard**, **Sync now**, **Settings...**, **Check for updates** and **Quit**.

Every pause, private mode and quit is recorded as an event, so the dashboard shows the gaps honestly.

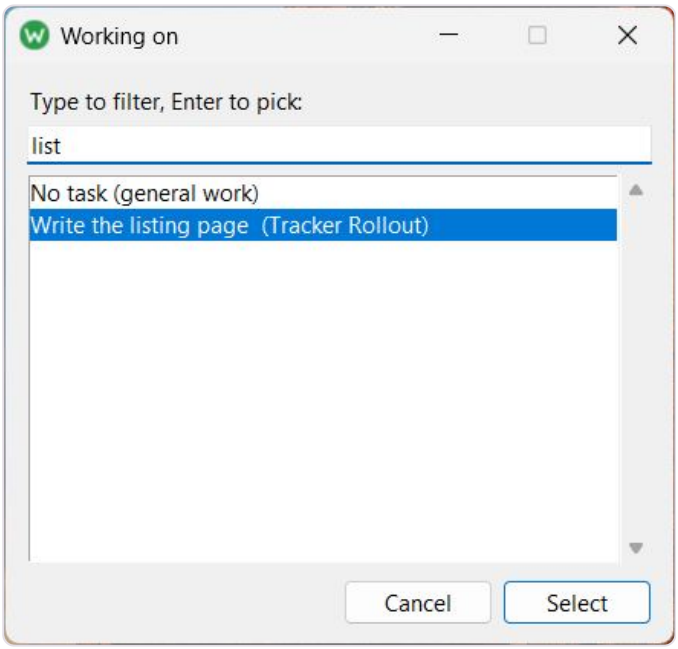

11 WINDOWS AGENT

Working on

With the Project bridge, the submenu lists the employee's open tasks: **No task (general work)**, **Recent**, then one group per project, and **Search task...**.

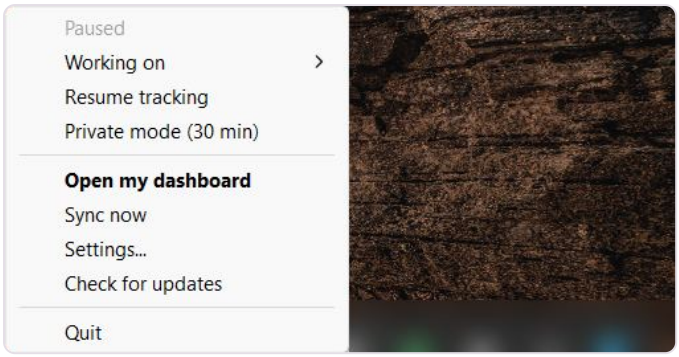

Without the bridge the list is empty and segments carry no task.

12 WINDOWS AGENT

Search task

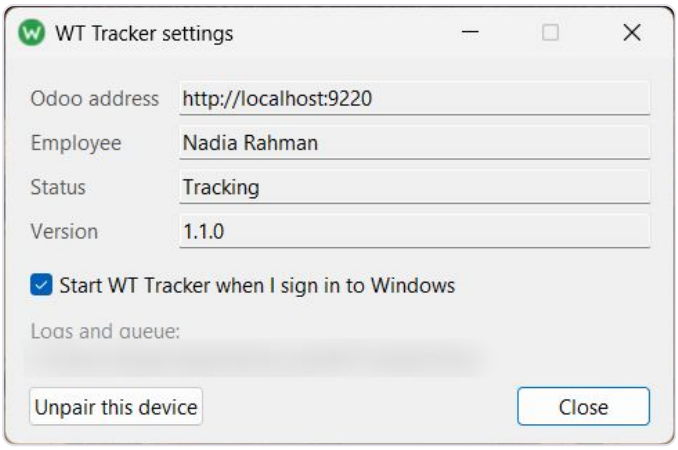

A small window: type to filter, Enter to pick. The choice travels with every segment from then on and is recorded as a Task changed event.

13 WINDOWS AGENT

Paused

Pause stops capture until Resume. Private mode is a pause that ends by itself after the minutes set in Odoo. Both survive a restart of the PC.

14 WINDOWS AGENT

Settings window

The Odoo address, the employee, the status, the version, **Start WT Tracker when I sign in to Windows**, where the logs and queue live, and **Unpair this device**.

Unpair tells Odoo, which revokes the device, and forgets the token on the PC.

Prompts the agent can show

Still on this task? When the company turns on Ask which task, the agent asks after the first activity of the day and after a break of 30 minutes or more (idle, locked or asleep). **Keep this idle time?** When Ask about idle time is above zero, after an idle stretch at least that long the agent asks whether it was work away from the PC, a meeting for instance. Keep turns those idle segments into active time in the category Away, kept, and rebuilds the day; Discard leaves them idle. Both answers are events.

Updates

15 WINDOWS AGENT

Signed updates

Once a day, and whenever Odoo says a newer minimum version is required, the agent reads latest.json from way4tech.com, downloads the installer, checks its SHA-256 and an Ed25519 signature made with Way4Tech's release key, and installs it silently while nothing is syncing.

An update URL in Odoo is accepted only if it is https and on the agent's built-in allow-list, so a compromised server cannot push its own installer.

Where things live on the PC

Item	Where	Notes
Program	%LOCALAPPDATA%\Programs\WTTracker	One folder, WTTracker.exe
Settings	%LOCALAPPDATA%\WTTracker\settings.json	A corrupt file is renamed .bad and recreated

Queue	queue.sqlite in the same folder	Capped at 100 MB: synced rows go first, then unsent rows older than seven days, then the oldest screenshots, then the oldest segments
Log	agent.log	Five files of 1 MB, never sent anywhere
Device token	Windows Credential Manager	Fallback: token.dat encrypted with DPAPI. Never in clear on disk; Odoo keeps only its SHA-256

A Wi-Fi drop, a server restart or a laptop closed overnight loses nothing: the queue holds the rows and the agent retries with a back-off from 5 seconds to 10 minutes.

For IT: silent and scripted installs

```
WT-Tracker-Setup-1.1.3.exe /VERYSILENT
"%LOCALAPPDATA%\Programs\WTTracker\WTTracker.exe" --pair ACME-7K3M-92QA --url https://erp.example.com
"%LOCALAPPDATA%\Programs\WTTracker\WTTracker.exe"
```

--url is optional when the prefix is in the tenants table. Other switches: **--version**, **--quit** (stop cleanly with a final sync), **--unpair** (tells Odoo and forgets the token), **--forget** (local only), **--wipe-local-data**, **--data-dir**, **--log-level DEBUG**, and for support **--settings-dialog**, **--pairing-dialog** and **--consent-dialog**. Running a new installer over an old one keeps the settings, queue and pairing.

Uninstall from Windows Settings stops the agent first. It leaves the local data folder unless the user answers yes to *Remove my local data?*, which also forgets the pairing token.

PART 6 Devices

CORE

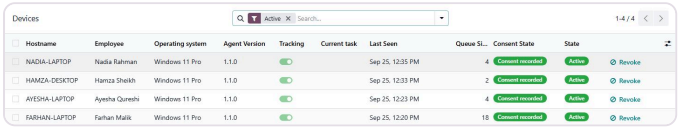

Every paired PC is a device: one agent, one employee. The device list is where you check that everyone is reporting, and the place to cut a PC off.

IN THIS PART YOU WILL LEARN

- What each column of the device list means
- The device form: who, agent, now, last contact
- Revoke, and self-service unpair
- The silent device check every 15 minutes

TRY IT YOURSELF ON THE DEMO

1. Open Configuration > Devices: four laptops, all active with consent recorded
2. Open NADIA-LAPTOP and look at the activity in the chatter: Tracker device silent
3. Do not press Revoke on the demo

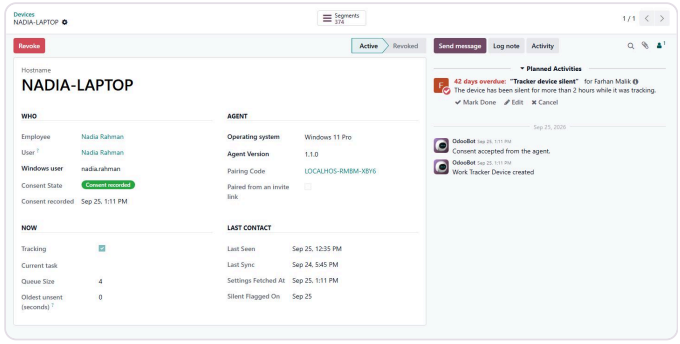

1 CORE

Configuration > Devices

Hostname, employee, operating system, agent version, tracking now, current task, last seen, queue size, consent state and state, with a Revoke link on each row. Filters: Active (default), Revoked, Tracking now, Consent recorded, Consent not recorded, Paired from an invite, Queue older than 1 hour.

Queue older than 1 hour finds a PC that is online but cannot get its rows through.

2 CORE

The device form

Who: employee, user, Windows user, consent state and when consent was recorded. **Agent**: operating system, agent version (flagged when older than the minimum), the pairing code and whether it was paired from an invite link. **Now**: tracking, current task, queue size, oldest unsent. **Last contact**: last seen, last sync, settings fetched at, silent flagged on.

Revoke

Revoke (managers) sets the device to Revoked and tracking off. Its next call to Odoo is refused with *This device has been revoked. Pair the agent again.*, the agent turns red and shows a toast. Revoking twice is refused with a message. An employee can unpair one of their own devices with **Unpair this device** on the device form, or from the agent; it is the only change a User can make to a device, and it only goes one way.

Silent devices

Every 15 minutes a scheduled action looks for devices that said they were tracking and have not called for two hours. It flags a device only inside the employee's working hours and only if it was seen earlier the same day, so PCs switched off for the evening page nobody. Each flagged device gets one to-do activity a day, *Tracker device silent*, for the employee's HR responsible, or their manager's user.

> The demo devices were last seen in September, so their silent activities show as overdue. On a real company these appear the same afternoon and are marked done once the PC is back.

The **Segments** smart button on the device opens everything that PC has sent, grouped by date.

PART 7 Rules and categories

CORE

Rules are what turn chrome.exe into productive or distracting. Getting them right for your own company is the most useful hour you will spend on this product.

IN THIS PART YOU WILL LEARN

- The four categories and what the weight does
- How a rule matches: application or title, contains, equals or regular expression
- The 18 starter rules and their order
- Making a rule straight from the segment list
- What happens to history when a rule changes

TRY IT YOURSELF ON THE DEMO

1. Open Configuration > Categories, then Rules, and read the patterns
2. Open the rule Odoo in a browser

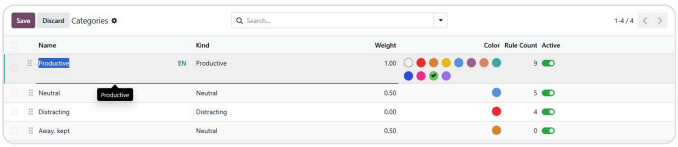

Categories

1 CORE

Configuration > Categories

Name, kind, weight, colour, how many rules use it, and active. The starter set: **Productive** (weight 1.00), **Neutral** (0.50), **Distracting** (0.00) and **Away, kept** (Neutral, 0.50), which holds idle time the employee chose to keep.

2 CORE

Weight

The weight is multiplied by the seconds in a segment to give the effort score: 1.0 counts in full, 0.5 counts half, 0.0 counts nothing. It must lie between 0 and 1. Choosing a kind fills in the usual weight and colour, which you may then change.

Make as many categories as you like, such as Customer calls at 0.8. Each belongs to one of the three kinds for the productive, neutral and distracting totals.

Rules

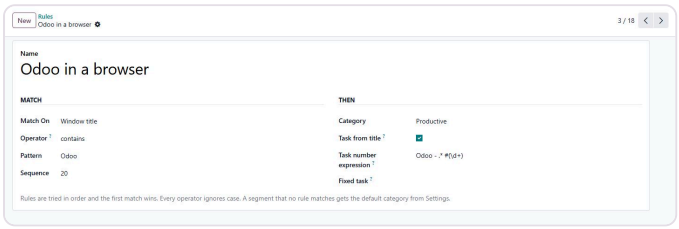

New Rules | Search... | 1-18 / 18

Name	Match On	Operator	Pattern	Category	T...	Active

Code edito...	Application	matches re...	^(code|code - insiders|cursor|pycharm64|idea64|webstorm64|phpstorm64|rider64|devenv|sublime_text|notepad\+\+|atom|vim|gvim|nvim...	Productive		
Office and ...	Application	matches re...	^(winword|excel|powerpnt|outlook|onenote|olk|msaccess|visio|winproj|acrord32|acrobat|soffice|swriter|scalc|simpress|thunderbird|notepa...	Productive		
Design tools	Application	matches re...	^(figma|photoshop|illustrator|indesign|xd|afphoto|afdesigner|gimp|inkscape|blender|autocad|acad|sldworks|revit)(\.exe)?$	Productive		

CORE The 18 starter rules in their order. Rules are tried top to bottom and the first match wins.

Field	Choices	Notes
Match on	Application, Window title	Application is the executable, such as EXCEL.EXE
Operator	contains, equals, matches regular expression	Every operator ignores case. A bad expression is refused when saved
Pattern	Text or expression	Such as figma|canva|miro
Category	Any category	Required
Sequence	Number	Lower is tried first: drag rows in the list
Company	Empty or one company	Empty is shared by every company

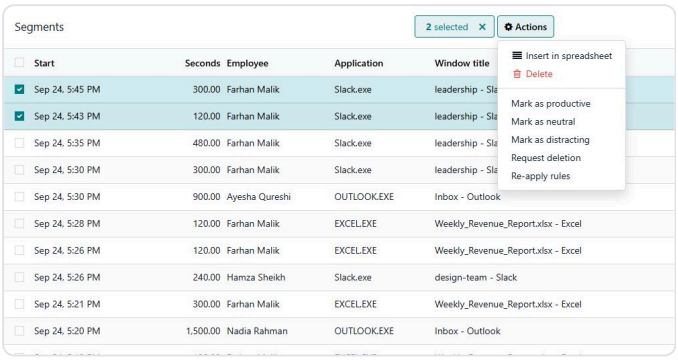

The order matters. The starter list puts video and social sites first (title rules, distracting), then Odoo, GitHub/GitLab/Bitbucket, Jira/Trello/Asana/Notion, Figma/Canva/Miro and Google Docs (title rules, productive), then Google Meet, Teams, Zoom and Slack/Discord/WhatsApp/Telegram (neutral), then code editors and terminals, Office and mail, and design tools (application rules, productive), games and media players (distracting), the Windows lock screen, Explorer and Settings (neutral), and last any browser page nothing above caught (productive). So YouTube in Chrome is distracting because its title rule comes before the browser rule.

3 CORE

A rule

Odoo in a browser: window title contains Odoo, productive, sequence 20. With the Project bridge the form also has **Task from title**, **Task number expression** and **Fixed task** (Part 15).

4 CORE

Make a rule from the segments

In Segments, tick rows and open **Actions**: **Mark as productive**, **Mark as neutral** or **Mark as distracting** opens a new rule already filled in from their applications (equals for one application, a regular expression for several) at sequence 5. Save it and the days of those segments are classified again at once.

Fastest way to fix the classification: look at a day, mark what is wrong.

Changing rules changes history only when you say so

A new or changed rule classifies new segments from then on. To apply it to the past, use **Re-apply rules** on selected segments, or **Configuration > Rebuild or re-apply rules** for a date range (Part 14). With **Store window titles** off, the agent stops sending titles at all, so title rules never match and only application rules classify the time, then and on any later re-apply.

PART 8 How segments become a day

CORE

Every report in the app reads one summary row per employee per day. Knowing how that row is built explains every number you will see: active, idle, effort, focus sessions, first and last.

IN THIS PART YOU WILL LEARN

- What the agent posts and what Odoo refuses
- The hourly rollup and why a day can look a little late
- Active, idle and outside working hours
- The effort score and focus sessions, worked through
- Two PCs at once

TRY IT YOURSELF ON THE DEMO

1. Open Team > Days and open one row: every figure on it is explained below

What arrives

Each sync posts up to 500 segments, 500 events and 10 screenshots, with the device's state (tracking or paused, the queue size, the current task). Odoo checks every item on its own and answers which were accepted and which were rejected with a reason, never failing the whole batch for one bad row. A segment is refused when it ends before it starts, is longer than 12 hours, ends more than 5 minutes in the future or started more than 30 days ago. Every item carries an id, so a batch sent twice is stored once.

The segment's day and hour are the employee's own, in the employee's timezone. Change an employee's timezone and all their days are rebuilt.

The rollup

A scheduled action, **Work Tracker: roll up daily summaries**, runs every hour and rebuilds only the days that changed since its last run: new segments, re-applied rules, kept idle time. So today's row can be up to an hour behind the segments. Rebuild a day by hand with **Rebuild from segments** on it.

The figures on a day

Figure	How it is worked out
Active	Seconds of segments that are not idle and not outside working hours
Idle	Seconds of idle segments
Outside working hours	Seconds captured outside the schedule in Mark mode. Counts for nothing
Productive, Neutral, Distracting	Active seconds split by the kind of their category
Productive %	Productive as a share of active
Effort (hours)	Each active segment's seconds times its category weight, added up, in hours
Focus sessions	Runs of 25 minutes or more of work with no idle, no distracting segment and no gap over a minute
First and last activity	The start of the first active stretch and the end of the last

HOW IT WORKS

Effort on Farhan Malik, Thursday 24 September

Productive 6:20	6.33 h × 1.0 = 6.33
Neutral 1:30	1.50 h × 0.5 = 0.75
Distracting 0:15	0.25 h × 0.0 = 0.00
Effort	**7.08 h** out of 8:05 active

With the Project bridge, a focus run is also ended by a change of task, because switching task breaks concentration as surely as switching to YouTube.

> Every day on the demo shows 0 focus sessions. The demo's activity alternates applications every few minutes with short neutral stretches between, so no run reaches 25 minutes under these rules. On a real day of long work in one editor the count rises.

Two PCs at once

An employee with a laptop and a desktop both running the agent posts overlapping segments. Before anything is added, overlapping segments of the same category are merged into one interval, so an hour on two PCs is one hour, not two.

Kept idle time

When the employee answers Keep to the idle prompt, the idle segments of that device inside the stretch become active, in the category Away, kept, and their day is rebuilt straight away.

PART 9 My Activity: one person, one day

CORE

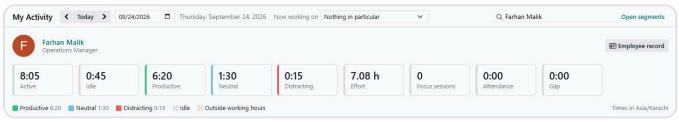

My Activity is the page an employee sees about themselves, and it is exactly the page a manager sees about them: the screen says so at the bottom. That symmetry is what makes tracking acceptable.

IN THIS PART YOU WILL LEARN

- Moving between days
- The tiles and the hour by hour timeline
- Time per application and effort per task
- The employee picker and the All employees view for managers
- Now working on, and asking HR to delete a day

TRY IT YOURSELF ON THE DEMO

1. With the manager login, open My Activity: it jumps to 24 September
2. Type Nadia into the search box at the top right and pick her
3. Choose All employees at the top of the picker

1 CORE

The day and the tiles

Arrows for the day before and after, **Today**, and a date field. Under the employee's name: Active, Idle, Productive, Neutral, Distracting, Effort and Focus sessions. With the Attendance bridge two more tiles, Attendance and Gap.

On a day with nothing, the page jumps once to the latest day that has data.

2 CORE

The timeline

One row per hour of the employee's day, in their own timezone (named at the right). Each bar is a segment coloured by its category; idle is hatched grey and outside working hours hatched beige. Hover a bar for its application, window title and times. Under it, an **Activity** strip shows keyboard and mouse events per active minute, hour by hour: a count, never content.

Farhan's lunch at 12:00 shows as idle, and 16:15 to 16:30 as distracting.

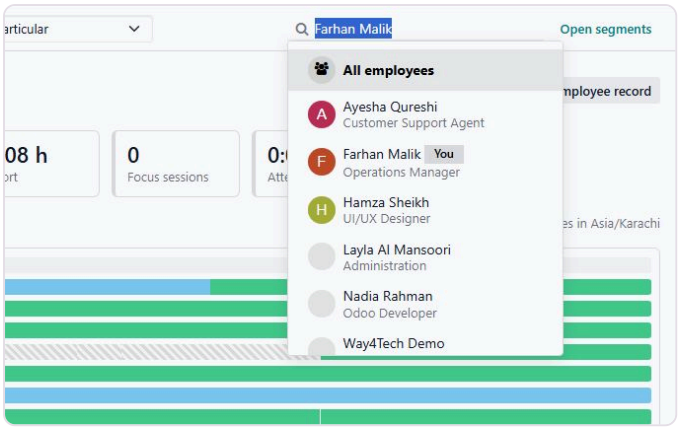

3 CORE

Effort per task and time per application

Time per application lists up to 15, longest first, leaving out idle and outside hours. Effort per task fills in with the Project bridge; without tasks it says *No segment carried a task. Pick one from the tray, or let a rule read it from the window title.*

Looking at somebody else

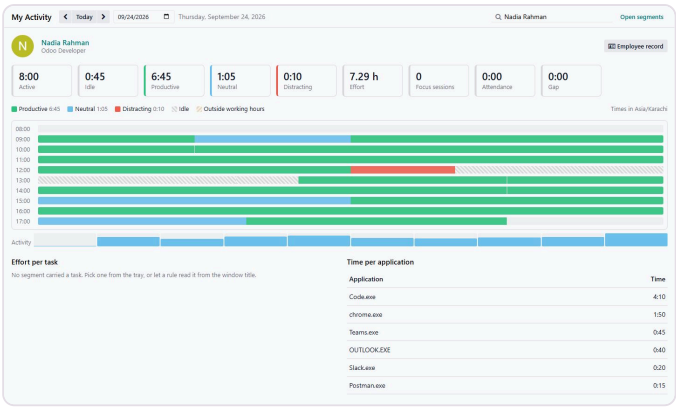

4 CORE

The employee picker

The search box at the top right. A Manager sees **All employees** first, then everyone in the company with a user, with job title and a You tag on their own name; typing matches name, work email, department and job title. A User sees only themselves.

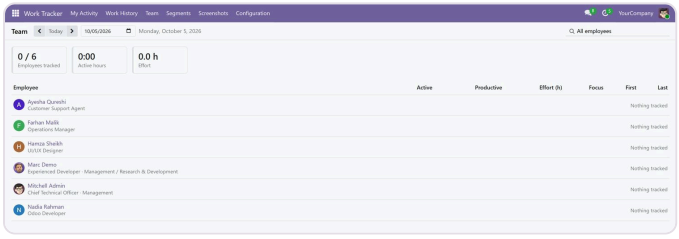

The choice is remembered in this browser.

5 CORE

Nadia Rahman's day

The same page for Nadia: 8:00 active, mostly Code.exe and Chrome. **Open segments** opens the segment list behind the page, and **Employee record** (managers only) her employee form.

6 CORE

All employees

One line per employee for the chosen day: active, productive %, effort, focus, first and last, with totals for employees tracked, active hours and effort. Click a name to open their Work History.

Test database. On the live demo pick 24 September to see the four people.

Now working on

The **Now working on** drop-down at the top lists your open tasks (Project bridge). Choosing one points your own tracker at it, exactly like **Working on this** on a task: the tray adopts it on its next sync. Do not change it on the demo.

Ask HR to delete this day

The link at the bottom of an employee's own page creates a to-do on their employee record, *Tracker data deletion requested*, for their HR responsible, or for every tracker manager of the company if there is none. Nothing is deleted until HR acts. The same request exists on selected segments and days.

The dashboard address the agent opens is **/tracker/me** on your Odoo, which redirects to this page after sign-in.

PART 10 Work History: one person over weeks

CORE

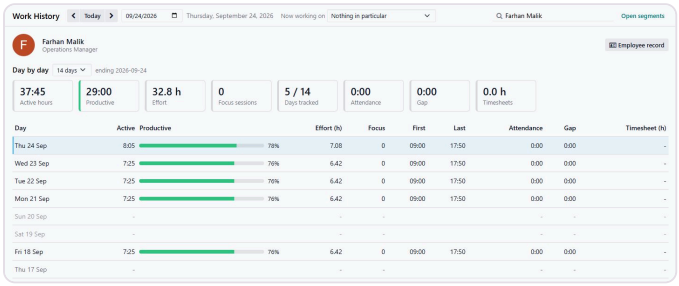

Work History lines up one employee's days, newest first, so a pattern shows: the Friday that always ends early, the week with no focus, a day with attendance but no activity.

IN THIS PART YOU WILL LEARN

- Choosing the person and the period
- The totals and the day by day table
- Categories, top applications and tasks in the period

TRY IT YOURSELF ON THE DEMO

1. Open Work History as the manager and keep 14 days
2. Pick Hamza Sheikh in the search box

1 CORE

Day by day

Choose 7, 14 or 30 days ending on the date at the top. Tiles: active hours, productive, effort, focus sessions and days tracked (5 / 14 on the demo). Each row: active, a productive bar with its percentage, effort, focus, first and last. Weekends and untracked days show a dash.

With the bridges: Attendance and Gap columns and tiles, and Timesheet (h) with a Timesheets tile.

Under the table: **Categories** with time per category for the period, **Top applications** (up to eight) and, with the Project bridge, **Tasks in this period** with the time and effort on each task and, with Timesheets, the hours booked.

A Manager opens anyone's history from the picker, the employee form's **Work history** smart button, the clock icon on the employee list or **Open work history** on the kanban card. A User who opens another person's history is shown their own: the server decides whose page it is.

PART 11 Team: the whole company, day by day

CORE

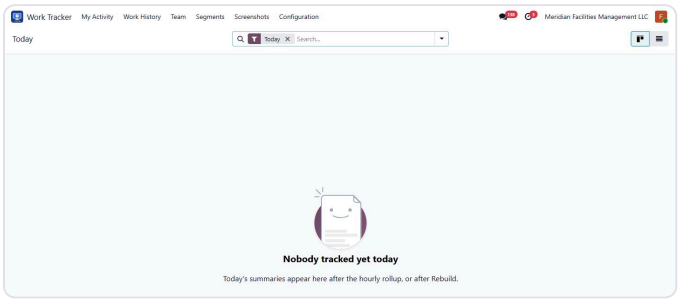

Team is the manager's view: one card or one line per employee per day, in a kanban, a list, a graph and a pivot.

IN THIS PART YOU WILL LEARN

- Team > Today and its empty state
- Team > Days: list, graph and pivot
- The day form and its buttons
- The filters that find the days worth a look

TRY IT YOURSELF ON THE DEMO

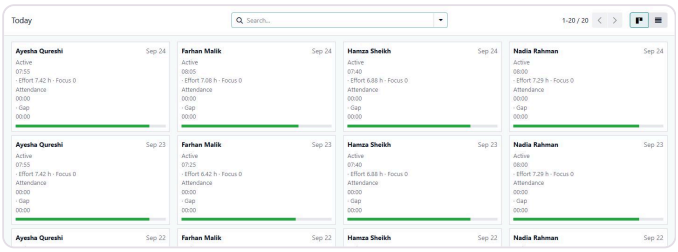

1. Open Team > Today, then remove the Today filter
2. Open Team > Days, remove the filters and switch to the pivot
3. Open one day of Nadia's

1 CORE

Team > Today

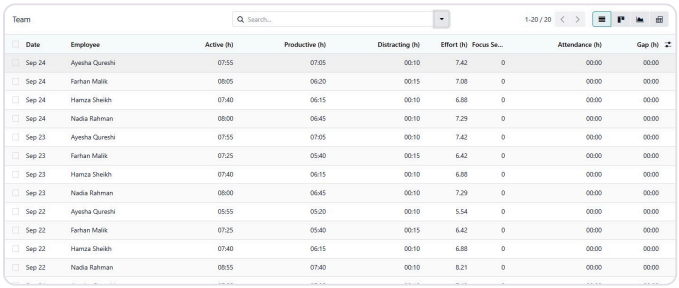

Today's cards. Before the first rollup of the day it reads *Nobody tracked yet today. Today's summaries appear here after the hourly rollup, or after Rebuild.*

2 CORE

The cards

Remove the Today filter to see every day. Each card: employee, date, active, effort, focus, and with the Attendance bridge attendance and gap, with a bar for productive time.

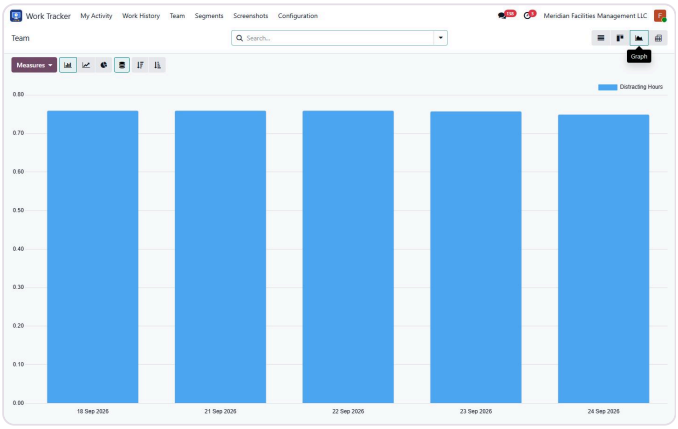

3 CORE

Team > Days

The list opens on Last 7 days grouped by date. Columns: date, employee, active, productive, distracting, effort, focus sessions, and the bridge columns.

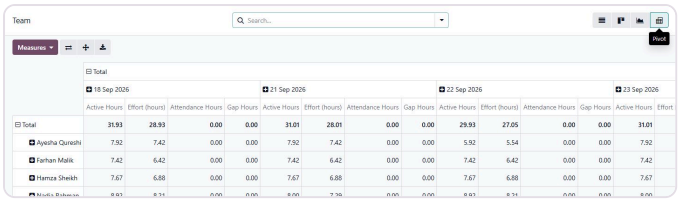

Remove the filters on the demo: its data is from September.

4 CORE

Graph

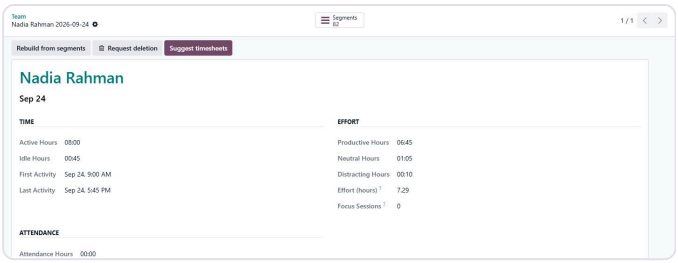

Any measure by day or employee, as bars or lines.

5 CORE

Pivot

Employees down, days across, any of the hour measures. Export to a spreadsheet from the pivot toolbar.

6 CORE

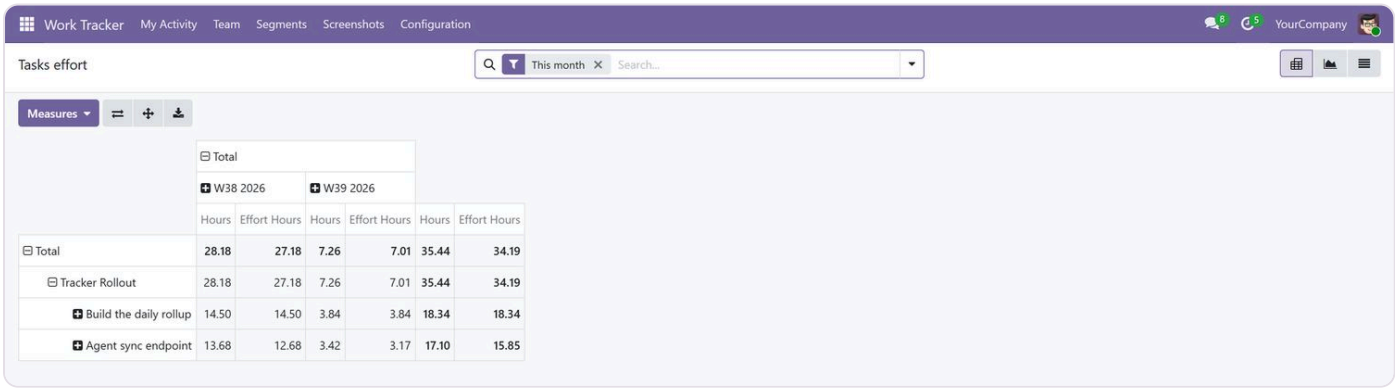

One day

Time (active, idle, first, last), Effort (productive, neutral, distracting, effort, focus sessions), Attendance with the bridge, and a Tasks tab with the Project bridge. Buttons: **Rebuild from segments**, **Request deletion** and, with Timesheets, **Suggest timesheets**. The Segments smart button opens that day's segments grouped by hour.

Rebuild and Suggest write to the database. Do not press them on the demo.

Filters on days

Filter	Finds
Today, Yesterday, Last 7 days, This month	Days by date
With focus sessions	Days with at least one focus run
Over an hour distracting	Days with more than an hour in distracting categories
Gap over 1 hour	Attendance bridge: clocked in at least an hour more than active
No attendance	Attendance bridge: activity on a day with no attendance
Timesheets suggested	Timesheets bridge: days already turned into timesheet lines
Group by Employee, Date, Week	

CORE Effort pivot by employee and week. Test database.

PART 12 Segments: the raw material

CORE

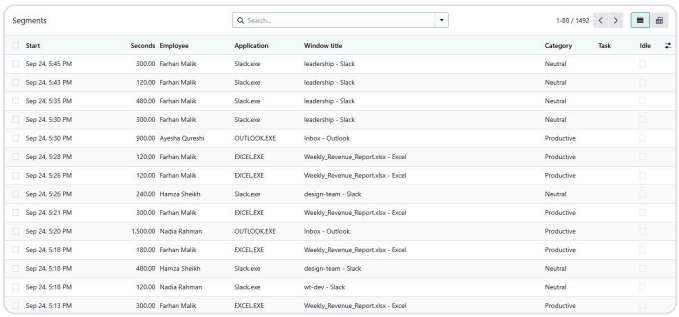

Every number in the app traces back to segments. When a figure looks wrong, this is where you look, and where you fix the classification.

IN THIS PART YOU WILL LEARN

- Reading the segment list and form
- The filters and group-bys
- The five actions on selected segments

TRY IT YOURSELF ON THE DEMO

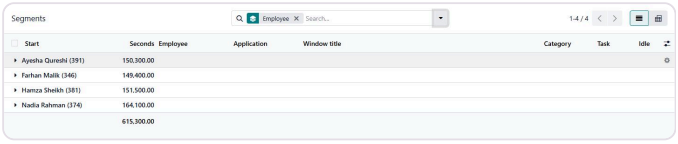

1. Open Segments, remove the Today filter and group by Employee
2. Open one of Nadia's Code.exe segments
3. Tick two rows and open Actions, then close it without choosing

1 CORE

The list

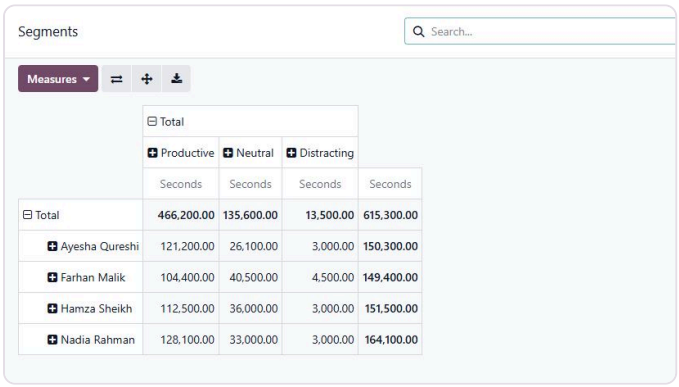

Start, seconds, employee, application, window title, category, task (Project bridge) and idle. It opens on Today grouped by employee.

2 CORE

Grouped

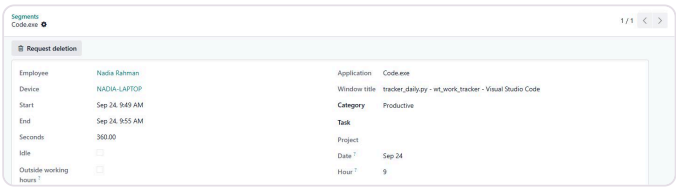

Group by Employee, Date, Hour, Application, Category or Device, and with the Project bridge Task or Project. The demo has 1,492 segments across four people.

3 CORE

Pivot

Seconds by employee and kind: Productive, Neutral, Distracting.

4 CORE

One segment

Employee, device, start, end, seconds, idle, outside working hours, input events, application, window title, category, task, project, date and hour.

Input events is a count of one-second checks that saw new input. It says how busy the hands were, never what they did.

Filters

Today, Last 7 days, Active, Idle, Productive, Neutral, Distracting, Outside working hours, and with the Project bridge On a task and No task.

Actions on selected segments

Action	Who	What it does
Mark as productive / neutral / distracting	Manager	Opens a new rule built from the selected applications; saving it re-classifies their days
Re-apply rules	Manager	Classifies the selection again with today's rules and rebuilds their days
Request deletion	User (own), Manager	A to-do for HR to delete the segments, naming how many and the time span

> Segments are read only for everybody. Nothing but a paired agent creates them, and a User cannot edit or delete their own: they ask HR.

PART 13 Screenshots

CORE WINDOWS AGENT

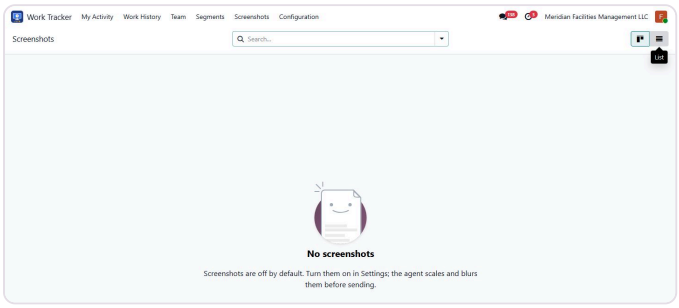

Screenshots are off by default and most companies should leave them off. When they are on, the agent shrinks and blurs each capture on the PC before it is sent, so what reaches Odoo shows the shape of the screen, not its words.

IN THIS PART YOU WILL LEARN

- Turning screenshots on and the four settings
- What the employee and the manager see
- How long screenshots are kept

TRY IT YOURSELF ON THE DEMO

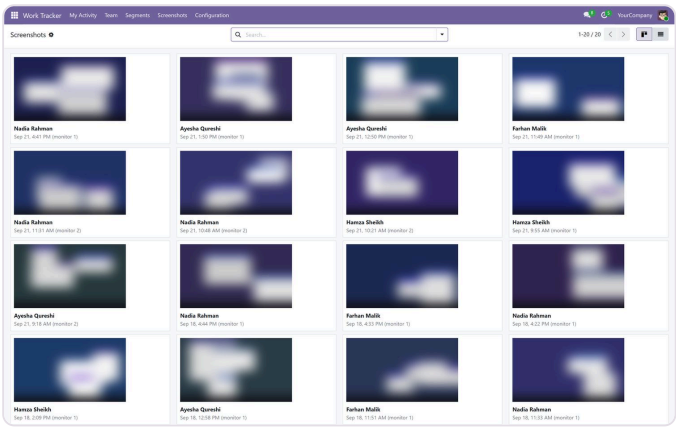

1. Open Screenshots on the demo: it says No screenshots, because the setting is off for this data

1 CORE

Off

Screenshots are off by default. Turn them on in Settings; the agent scales and blurs them before sending.

2 CORE

On

A kanban of captures with the employee, the time and the monitor number, grouped by day from the employee form. Pictured on a test database.

These are blurred on the PC. Leave Blur screenshots on.

Setting	Default	Notes
Screenshot every (minutes)	10	1 to 1440
Screenshot scale	0.25	0.1 to 1. A quarter of the width and height
Blur screenshots	On	The blur is applied inside the agent before the image leaves memory
All monitors	Off	On: one capture per monitor, each with its number. Off: the main monitor only
Keep screenshots (days)	14	Older ones are deleted every night

A screenshot is visible to the employee it belongs to and to tracker managers, nobody else. Nothing is captured while paused, in private mode, locked or asleep, and with consent required no screenshot is accepted before the employee has accepted the consent text.

> Screenshots are personal data. Check the law where your staff work before turning them on, and say so in the consent text.

PART 14 Events, the sync log and rebuilding

CORE

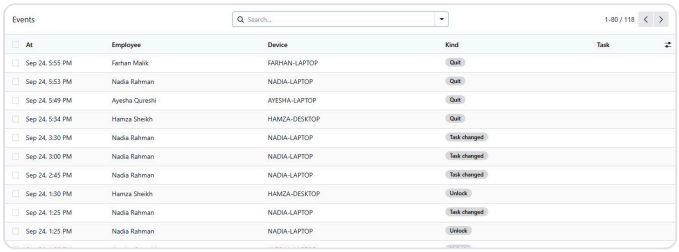

Three Configuration screens answer the support questions: what did the agent do, did it talk to us, and how do I make history match my new rules.

IN THIS PART YOU WILL LEARN

- The twelve kinds of event
- Reading the sync log
- Rebuild daily summaries, and re-apply rules then rebuild

TRY IT YOURSELF ON THE DEMO

1. Open Configuration > Events and remove the Today filter
2. Open Configuration > Rebuild or re-apply rules and press Cancel

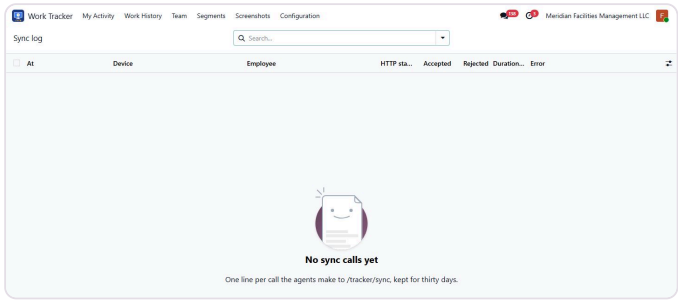

1 CORE

Events

When, employee, device, kind and task. Kinds: Start, Pause, Resume, Private mode, Quit, Task changed, Lock, Unlock, Sleep, Wake, Idle time kept, Idle time discarded. Filter Today, group by Kind or Device.

The demo has 118: start, lock, unlock and quit for every day, and 38 task changes.

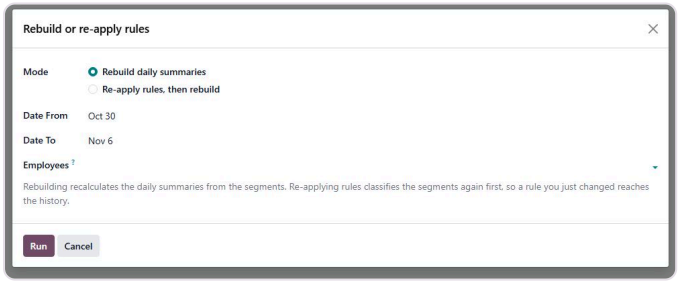

2 CORE

Sync log

One row per call to the sync endpoint, refused ones included: when, device, employee, HTTP status, accepted, rejected, duration and the error. Filters: Failed, With rejections. Kept 30 days.

The demo data was loaded directly, so its log is empty.

3 CORE

Rebuild or re-apply rules

Rebuild daily summaries recalculates the days from their segments. **Re-apply rules, then rebuild** classifies the segments again first, so a rule you just changed reaches the past. Choose a date range (at most a year) and, optionally, employees; leave them empty for everyone. Run shows how many days were rebuilt.

Run writes. On the demo, Cancel.

Team > Days > Actions > Rebuild a date range opens the same window. A day whose segments retention has deleted keeps its summary, so rebuilding old ranges never empties your history.

Status codes the agent may meet

Answer	Meaning
200	Accepted, with any rejected rows listed and their reasons
401	Token missing, unknown or revoked, employee archived or user inactive. The agent turns red
403	The device user may not do that. Details in the Odoo log
409 / 410	Pairing code already used / expired
429	Too many calls or pairing attempts. The agent waits
500	Server error. The agent retries with back-off

PART 15 Tasks: the Project bridge

PROJECT BRIDGE

Time by application tells you how someone works. Time by task tells you what it cost. The Project bridge puts a task on every segment, from the tray, from the window title, or from a button in Odoo.

IN THIS PART YOU WILL LEARN

- The three ways a segment gets a task
- Which tasks the tray offers
- Task numbers in window titles, safely
- Working on this, from the task form, the kanban card and My Activity
- Tracked effort on tasks and projects, and Team > Tasks effort

TRY IT YOURSELF ON THE DEMO

1. Open a task in Project: note Working on this in its header, and do not press it
2. Open Work Tracker > Team > Tasks effort

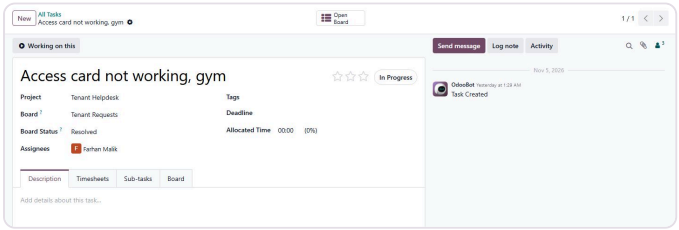

Three ways to a task

Source	How
The tray	Working on lists the employee's open tasks; the choice travels with every segment
A rule	Task from title reads a task number out of the window title; Fixed task pins one task on whatever the rule matches
Odoo	Working on this on a task points the employee's own tracker at it; the tray adopts it on its next sync

The tray list holds up to 30 tasks assigned to the employee, not done or cancelled, and not in a folded stage, soonest deadline first. Project's own access rules decide what is offered. A task id the employee cannot see is dropped from what the agent posts.

Task numbers in titles

A rule with **Task from title** ticked reads the number with its **Task number expression**, a regular expression with exactly one group. The default is **T#(\d+)**, so an employee writes T#123 in a document or branch name on purpose. A bare #123 is not used, because GitHub issues, pull requests and phone numbers would hang time on the wrong task. The starter rule *Odoo in a browser* uses **Odoo - .* #(\d+)**, the number an Odoo task page shows in its tab title; the GitHub and Jira rules use T#. A number only lands on a task the employee is assigned to, in the same company. A **Fixed task** on a rule is used only when the segment has no task of its own.

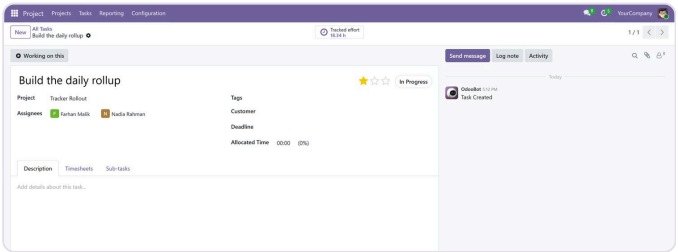

1 PROJECT BRIDGE

Working on this

On the task form header (and in the kanban card menu, and the Now working on drop-down on My Activity). It sets the current task on your own active devices and posts a note on the task, *<you> started tracking this task.* With no paired device it says *No active tracker device is paired for your user. Install the agent and open your invite link first.*

Working on this writes. Do not press it on the demo.

2 PROJECT BRIDGE

Tracked effort on the task

Once segments carry the task, a **Tracked effort** smart button shows the weighted hours from the daily task lines and opens the task's active segments by date. Test database.

On the project form managers get a Tracked effort smart button (the tasks' effort added up, opening Tasks effort for that project) and a **Tracked vs planned** progress bar: tracked effort as a share of the tasks' allocated hours, over 100 when more was tracked than planned, capped at 999.

Team › Tasks effort

One line per task per employee per day: task, project, time, effort, and the timesheet with the Timesheets bridge. Pivot, graph and list; This month by default; group by Task, Project or Employee. The day form gets a Tasks tab with the same lines, My Activity fills Effort per task, and Work History fills Tasks in this period.

> On the live demo no segment carries a task, so Tasks effort reads *No task effort yet. Effort per task appears once segments carry a task, from the tray or from a rule.*

With the bridge, a focus session also ends when the task changes.

PART 16 Project Pro: effort on the board

PROJECT PRO BRIDGE

Teams that run their work on Project Pro boards should not have to open the tracker to see it. This bridge installs itself when the Project bridge and Project Pro are both present.

IN THIS PART YOU WILL LEARN

- The Tracked (h) column on every board
- Effort and Working on this in the item dialog and on the full item page

TRY IT YOURSELF ON THE DEMO

1. In Project Pro, open Work > All Items and open one item

1 PROJECT PRO BRIDGE

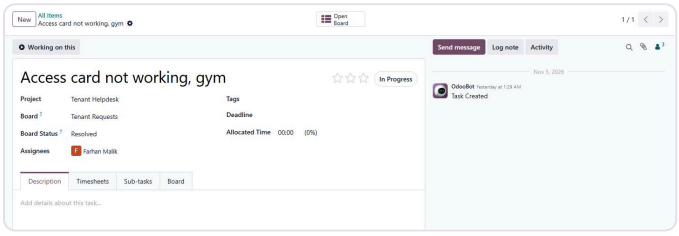

Tracked (h) column

Every Project Pro board gets a **Tracked (h)** column after the planned hours, shown by default and hideable from the column picker. It is not summed in group totals, because the figure is computed per item rather than stored.

2 PROJECT PRO BRIDGE

Item dialog

The item dialog shows **Tracked effort (h)** next to the allocated hours once the item has segments, and a **Working on this** button in its row of actions.

3 PROJECT PRO BRIDGE

Full item page

The full page has the same Tracked effort smart button as a plain task and Working on this in its header.

Shown on the demo item Access card not working, gym. Its smart button stays hidden until segments carry the item.

Everything else (rules, tasks in the tray, Tasks effort) comes from the Project bridge, because a Project Pro item is an Odoo task.

PART 17 Suggested timesheets

TIMESHEETS BRIDGE

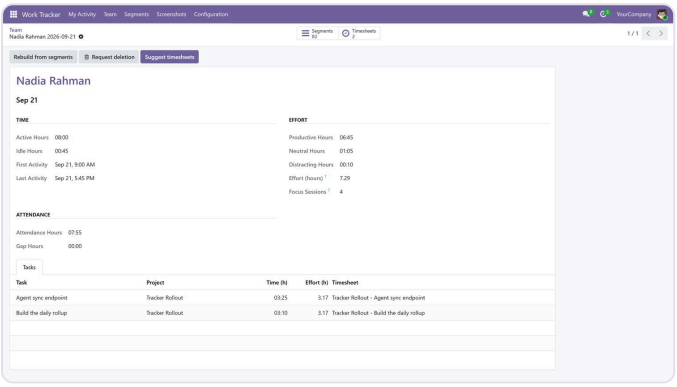

Most people fill in timesheets on Friday from memory. With the Timesheets bridge a manager turns a tracked day into timesheet lines in one click, and the employee only checks them.

IN THIS PART YOU WILL LEARN

- Suggest timesheets on one day or many
- Rounding, and the lines that are skipped
- Why a line is never suggested twice

TRY IT YOURSELF ON THE DEMO

1. Open a day in Team > Days and find the Suggest timesheets button; do not press it

1 TIMESHEETS BRIDGE

Suggest timesheets

On a day form, or **Actions > Suggest timesheets** on several days. One timesheet line per task line that has none yet, named *WT Tracker: <task>*, on the task's project, for the employee and the date, with the effort hours rounded to the company step. A notice says how many were suggested and how many skipped. Test database.

Managers only: an employee cannot write their own timesheet from data they might have shaped.

2 TIMESHEETS BRIDGE

Rounding

Settings > Timesheet rounding (minutes), default 15, between 1 and 240. 2 h 07 rounds to 2 h 00 at 15 minutes. A line that rounds to zero is not suggested.

3 TIMESHEETS BRIDGE

Skipped

A task whose project does not allow timesheets, or has no analytic account, is skipped.

4 TIMESHEETS BRIDGE

Never twice

The task line remembers its timesheet. Suggest again and only lines without one are created. A task line that has a timesheet is kept, at zero if need be, through every rebuild, so the timesheet never points at nothing.

The day form then has a **Timesheets** smart button, the days list a **Timesheets suggested** filter, Tasks effort a **Not on a timesheet** filter, and Work History a Timesheet (h) column. Employees confirm or edit the lines in Timesheets as usual; the tracker never validates them.

> The suggested hours are effort hours, the weighted figure, not raw active time. An hour of neutral work on a task suggests half an hour. Choose your category weights with that in mind.

PART 18 Attendance and the gap

ATTENDANCE BRIDGE

Attendance says when someone was clocked in. The tracker says when their PC was in use. The difference, the gap, is the most useful single figure for a manager of desk work.

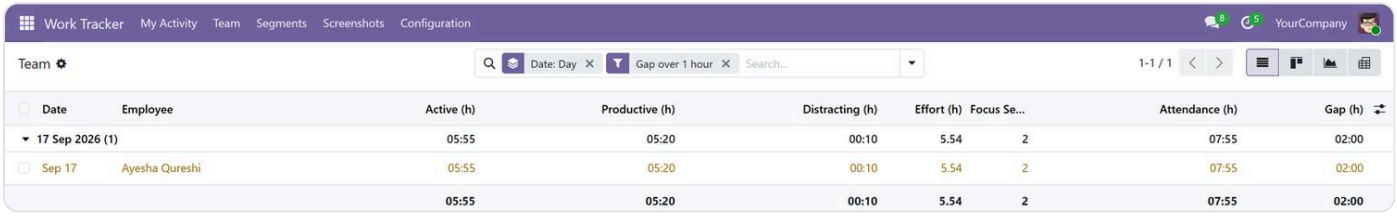

IN THIS PART YOU WILL LEARN

- How attendance is read for a day
- The gap and the two filters
- Where the figures appear

TRY IT YOURSELF ON THE DEMO

1. Open Team > Days and look at the Attendance (h) and Gap (h) columns

Every day carries the **worked hours** of the attendances that started on the employee's day, in their timezone; an attendance still open has none yet. The **gap** is attendance minus active time, never below zero: time clocked but not seen on the PC. Meetings, site visits and phone calls live in the gap, which is why the idle prompt exists.

ATTENDANCE BRIDGE Team > Days filtered on Gap over 1 hour: clocked in 7:55, active 5:55, a gap of 2:00. Test database.

Where	What
Team lists, kanban and pivot	Attendance (h) and Gap (h)
Filters	Gap over 1 hour; No attendance (activity on a day with no attendance)
My Activity	Attendance and Gap tiles
Work History	Attendance and Gap columns and tiles
Weekly digest	A Gap (h) column

> The live demo has no attendances for the tracked people, so every Attendance and Gap figure on it reads 0:00.

PART 19 Privacy, consent, retention and deletion

CORE WINDOWS AGENT

Tracking people at work is legal in most places only when it is proportionate, explained and limited in time. The product gives you the controls; using them is your decision.

IN THIS PART YOU WILL LEARN

- Who sees what
- Consent: the text, the gate, and what is still recorded
- Retention and the three nightly clean-ups
- Deletion requests

TRY IT YOURSELF ON THE DEMO

1. Open a device and read its Consent recorded time
2. Open My Activity and read the line at the bottom of the page

Who sees what

A User reads only their own segments, days, devices and screenshots, enforced by record rules on every list. A Manager reads everyone in their companies. The page a manager opens about an employee is the same page the employee sees about themselves. Nothing a User does can create, change or delete activity: only a paired agent writes it.

Consent

With **Consent before tracking** on (the default), the agent shows the consent text at pairing and again at every start until the employee accepts. Until then segments and screenshots from that device are refused; start, quit and lock events are still recorded. Accepting stamps the time on the device; declining clears it, so a later acceptance is a new consent. The employee form shows Consent recorded, Consent not recorded or No device paired, and Devices has a Consent not recorded filter.

The default text says what is recorded, what is not, that screenshots happen only when turned on and are blurred first, that tracking can be paused, what the data is used for, who sees it and that it is deleted after the retention period. Edit it in Settings to name your company's reasons and contact.

Retention

Scheduled action	Runs	Deletes
Work Tracker: delete old segments	Daily	Segments older than Keep segments (days), default 90. Zero keeps them
Work Tracker: delete old screenshots	Daily	Screenshots older than Keep screenshots (days), default 14
Work Tracker: delete old sync logs	Daily	Sync log rows older than 30 days

Daily summaries are never deleted by retention. They are the summary, so a year of Team figures survives after the segments behind them are gone.

Deletion requests

Ask HR to delete this day on My Activity, and **Request deletion** on selected segments or days, put a to-do on the employee record, *Tracker data deletion requested*, for the employee's HR responsible or every tracker manager when there is none, naming the days or the segment span. The decision and the deletion stay with HR.

Window titles

Titles carry the most personal detail: document names, mail subjects, chat partners. Turn **Store window titles** off and the agent stops sending them; classification then rests on application rules alone. The agent's own log on the PC

records titles only at debug level and is never sent.

PART 20 The weekly digest

CORE

One mail on Monday morning with last week for every tracked employee, for the people who would otherwise never open the app.

IN THIS PART YOU WILL LEARN

- Turning the digest on and choosing recipients
- What the mail contains

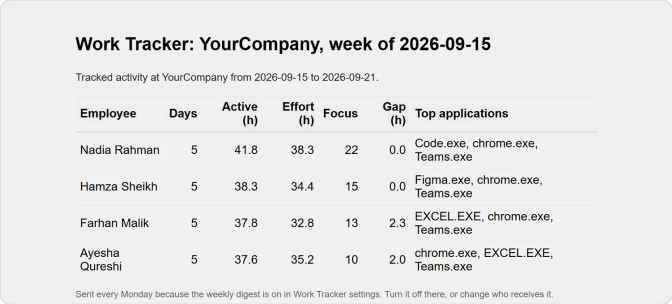

TRY IT YOURSELF ON THE DEMO

1. The digest is off on the demo; read the sample below

1 CORE

Turn it on

Settings > Reports > Weekly digest, then pick the **Digest recipients** (users with an email).

Work Tracker: YourCompany, week of 2026-09-15

Tracked activity at YourCompany from 2026-09-15 to 2026-09-21.

Employee	Days	Active (h)	Effort (h)	Focus	Gap (h)	Top applications
Nadia Rahman	5	41.8	38.3	22	0.0	Code.exe, chrome.exe, Teams.exe
Hamza Sheikh	5	38.3	34.4	15	0.0	Figma.exe, chrome.exe, Teams.exe
Farhan Malik	5	37.8	32.8	13	2.3	EXCEL.EXE, chrome.exe, Teams.exe
Ayesha Qureshi	5	37.6	35.2	10	2.0	chrome.exe, EXCEL.EXE, Teams.exe

Sent every Monday because the weekly digest is on in Work Tracker settings. Turn it off there, or change who receives it.

2 CORE

The mail

Subject *Work Tracker: <company>, week of <date>*. Last Monday to Sunday, one row per employee, most active first: days tracked, active hours, effort hours, focus sessions and the top three applications, with a Gap (h) column when the Attendance bridge is installed. Test database.

The scheduled action **Work Tracker: weekly digest** runs once a week, first on the Monday after install at 06:00 server time. A company with no recipients, or the digest off, gets nothing.

PART 21 A 15-minute demo, questions, and the menu map

CORE

A short script for showing the product to somebody else, the questions people ask, and every menu on one page.

A 15-minute demo

Minute	Show	Say
0 to 2	Part 1 table: captured and never captured	It records which app is in front and whether the PC is in use. Never keystrokes.
2 to 5	The agent: install, invite link, consent, tray	One link, no admin rights, the employee accepts the text first and can pause.
5 to 8	My Activity for Farhan on 24 September	Tiles, the timeline, lunch as idle, a quarter hour distracting at 16:15.
8 to 10	Picker: Nadia, then All employees	The same page the employee sees, for each person.
10 to 12	Rules, and Mark as productive on a segment	Your own classification in a minute, and history re-applied.
12 to 14	Team > Days pivot, Work History	Effort by person and week; a person over two weeks.
14 to 15	Tasks, timesheets and the gap	With Project, Timesheets and Attendances it fills tasks and timesheets and shows the gap.

Questions

Question	Answer
Does it record keystrokes?	No. It counts one-second checks that saw input, never what was typed or clicked.
Does it work on Mac or Linux?	No. The agent is for Windows only.
Does it need Enterprise?	No. Odoo 19 Community or Enterprise with Employees installed.
Can it run offline?	The agent queues up to 100 MB on the PC and sends it when the network is back.
Can an employee switch it off?	They can pause, use private mode, unpair or quit at any time. Each is recorded as an event.
Can a team lead see only their team?	No. The Manager level sees the whole company.
Does it read web addresses?	No. Only what a browser puts in its window title.
Who installs updates?	The agent updates itself from way4tech.com after checking the signature.
Is the agent a separate purchase?	The agent is a free download. The module is USD 199; the four bridges are free.
Can we host the installer ourselves?	Yes, set the download URL. Updates come only from hosts on the agent's built-in list.

Menu map

Work Tracker

My Activity Core	One person, one day: tiles, timeline, apps, tasks
Work History Core	One person, 7 to 30 days, day by day
Segments Core	Every stretch of time in one window
Screenshots Core	Blurred captures, when turned on

Team (Manager)

Today Core	Today's cards for everyone
Days Core	List, kanban, graph and pivot of daily summaries
Tasks effort Project bridge	Effort per task per person per day

Configuration (Manager)

Rules Core	Application or title to category, and task
Categories Core	Productive, neutral, distracting, with weights
Devices Core	Every paired PC, revoke
Pairing codes Core	Open, used and expired codes
Events Core	Pause, lock, quit, task changes
Sync log Core	One row per agent sync, 30 days
Rebuild or re-apply rules Core	Recalculate a date range
Settings Core	Administrator: every company setting

Elsewhere in Odoo

Employee > Tracker tab Core	Invite, Generate pairing code, devices
Employee smart buttons Core	Work history, time, segments, screenshots, devices
Task > Working on this Project bridge	Point your tracker at a task
Project > Tracked effort Project bridge	Effort and tracked vs planned
Project Pro board Project Pro bridge	Tracked (h) column and item effort
Day > Suggest timesheets Timesheets bridge	Timesheet lines from effort per task

Windows tray

Working on Windows agent	Pick a task, Recent, Search task
Pause / Private mode Windows agent	Stop tracking, or for 30 minutes
Open my dashboard Windows agent	My Activity in the browser
Settings... Windows agent	Address, employee, run at sign-in, Unpair

Want this for your team?

We install the module on your Odoo 19, set the rules and categories for the applications your people use, write the consent text with you, roll the Windows agent out to every PC with one invite link, and connect it to Project, Timesheets and Attendances where you run them.
